Today and tomorrow, I am putting them through the Home Lighting School, which is being conducted by the representatives of the Westinghouse Lamp Company and from which I expect that they will secure a great deal of valuable information to better equip them to perform their duties as Electric Home Specialists, exponents of the art of living electrically.

I am having the names of the customers here taken from the tabulation of the survey which was made, and divided into lists to be used by the Electric Home and Farm Authority Specialists. Mrs. Tandy will be started immediately [fol. 3309] after the end of our lighting school, on the job of contacting and helping the present owners of electric ranges. Mrs. Bradley will campaign here.

The men will be provided with the lists which we are preparing and will be started out Monday morning on a definite program of beginning to contact the people, in spite of the fact that the dealers here do not as yet have stocks of TVA appliances and we have not yet given the dealers or the people the answers to the questions which they are asking with regard to the financing plan.

If you think we should further delay this work, please let me know immediately upon receipt of this letter.

I trust that you will let nothing prevent you from making the trip down here at the earliest possible moment, and in

COMPLAINANTS' EXHIBIT No. 668 (Excluded)

the meantime, I am awaiting the coming of Mr. Wank, the architect, so as to make some final negotiations with the people from whom we expect to rent offices.

Guy W. Thaxton, Division Engineer.

[fol. 3310] COMPLAINANTS' EXHIBIT No. 669 (Excluded)

Tennessee Valley Authority

Office Memorandum

To: Mr. G. D. Munger, Commercial Manager, EHFA, Chattanooga.

From: H. A. Warner, Tupelo.

Date: November 3, 1934.

Subject: EH&FA Financing for Rural Customers.

Many present and prospective customers living along rural lines receive the bulk of their annual cash income at one time each year, usually in the fall when harvested crops are sold. This contrasts sharply with urban customers whose incomes are received monthly and often weekly.

It is believed that a financing plan that would best fit into the rural customers' needs would be worth while. We would like to offer for consideration a suggested plan as follows:

The rural customer purchases on a 36 months Conditional Sale Contract making a down payment equal to the minimum specified Down Payment plus the monthly payments for the first twelve-months period of the contract. One year later the purchaser pays in one lump sum the monthly payments for the second twelve-months period. Two years later the purchaser pays in one lump sum the monthly payments for the third twelve-months period. When the third [fol. 3311] and final payment is made the amount can be adjusted to compensate purchaser for the unearned finance charges incident to completion of contract before expiration date.

This suggested plan would appear to satisfy the following conditions:

Meet the financial condition of the rural customer; Split the total cost into three annual payments, each approxi-

COMPLAINANTS' EXHIBIT No. 669 (Excluded)

mately one-third of the total; Provide a very satisfactory cash, or down payment; Avoid any past due monthly payments; The dealer's position as to credit and endorsement is not affected.

This suggestion in effect obtains a much larger down payment than usual and leaves an approximate two-thirds of contract price as the Unpaid Balance although the Contract would indicate that some 96% of cash delivered price is the unpaid balance. This would appear to be necessary in order to avoid showing any monthly payments as being in arrears. The rural purchaser is slightly penalized under this plan to the extent that he has paid twelve monthly payments in advance instead of paying each as it became due each succeeding month. We do not think it a strong argument against the plan.

We appreciate that there may be other factors with which we are not familiar which may indicate the necessity of modifications or disapproval. The objective is our prime interest.

H. A. Warner.

Office Memorandum

To: W. B. Phillips, Chattanooga, Tennessee.
From: J. Van Rogers, Tupelo, Mississippi.
Date: August 16, 1934.
Subject: Travelling Demonstration Kitchen.

Replying to your memorandum of August 12, and your request for information on this subject, dated July 26, I am attaching a list of towns and date set-up for demonstration of this truck, along with comments and reactions of the different county agents with whom I have discussed this matter.

From day to day I will send you additional schedules as they are completed.

COMPLAINANTS' EXHIBIT No. 670 (Excluded)

You will note that I have scheduled September 4 as the opening date, as September 3 is Labor Day and we feel that it would not be a very good day to hold a demonstration.

The locations of cooking schools on the attached list have been obtained without any cost to the TVA.

J. Van Rogers.

Itinerary for Traveling Kitchen

We are becoming a little bit anxious about the itinerary for the traveling kitchen. Will you kindly let us know or ask Mr. Rogers to let us know what progress has been made in working out the route for the truck.

The truck is going to be ready to go on the road without fail Monday, September 3. The demonstrator has been employed and all preparations at this end are well in hand. Please let us know what has been accomplished at your end.

W. B. Phillips.

July 26, 1934.

Travelling Demonstration Kitchen

I believe it is going to be possible to get the travelling demonstration kitchen on the road in your district during the week beginning August 13.

Attached herewith you will find a tentative itinerary for the work over a two months period which Mr. Osborne has prepared as a result of his discussions with you and Mr. Rogers last week. This itinerary is tentative only and its final form is dependent upon such definite arrangements only *and its final form is dependent upon such definite arrangements* as can be made in each of the towns scheduled. We would very much like to have Mr. Rogers go over this route beginning Monday of next week so that we can be certain by the 13th of a final itinerary for the truck.

You will note that on each weekly schedule, so far as our information allows, we have placed the names of the county agent, the home demonstration agent and the home economist teachers, as well as the names of dealers. We believe it would be well for Mr. Rogers to make initial contacts with each one of these persons to inform them of the visit [fol. 3320] of the truck and to tell them as definitely as he is able, though subject to a possible revision, when the demonstration kitchen will reach the town noted. We will want to engage home economics teachers and county and home demonstration agents very fully in this work. Miss Davison will follow up Mr. Rogers' initial visits to these people with personal letters.

We would like a report from Mr. Rogers on this itinerary with some definite comment as to locations for displaying the kitchen and as to cooperation from dealers and others, in our hands not later than August 8, as we will need a few days before the truck goes on the road to send out our advance information to consumers.

While our consumer list for your territory is fairly complete, we think it would be advisable to have in addition the telephone directory for each town on the route of the demonstration. If Mr. Rogers will secure these direc-

tories as he goes along and forward them to us with his report, they will prove helpful in circularizing advance material.

A sufficient length of time before the arrival of the truck in each town on the route, we will see that local newspapers in the neighborhood are supplied with stories and photographs. We will also see that dealers in each of the towns are supplied with window cards and other material announcing the day and location in the town of the kitchen. The posters and window cards will have a blank space which [fol. 3321] can be filled in showing the location of the kitchen and the time the demonstration will be held in each town. Mr. Rogers' report should allow us to schedule this material accurately.

Mr. Thaxton, W. B. Phillips, July 26, 1934

Travelling Demonstration Kitchen—2

In speaking to dealers of the visit of the kitchen to their towns Mr. Rogers should be careful not to present the idea as a definite tie-in on the part of EHFA, for sales. The demonstrator will keep records of attendance on individual registration cards which will be forwarded to the division office after each demonstration for follow-up by Electric Home Representatives. The kitchen will carry an L. & H. Range, Cleveland water heater, and Kelvinator chest-type and Frigidaire front-opening refrigerators. It will be obviously impossible to tie-in all manufacturers and dealers by products. But all dealers should be encouraged to work with the kitchen and should be assured that demonstrations will be carried out with impartiality and in a strict spirit of fairness.

The itinerary which accompanies this memorandum is dependent upon available facilities for display as uncovered by Mr. Rogers. He should make his report to us complete enough for the itinerary to be drawn up in definite and final [fol. 3322] form before the truck starts on the road.

The project is so drawn as to allow a small sum of money for rentals on empty store buildings, et cetera, although we would of course prefer to hold the demonstrations in schools or other public places. Where schools and other places of the sort are not available, Mr. Rogers should make

COMPLAINANTS' EXHIBIT No. 673 (Excluded)

arrangements for renting suitable space. Where we have to rent space, we would like to get by for as little as possible and without formal agreements. The demonstrator will settle for the amount at the time the kitchen visits the town. She will also settle for the local labor which the project allows the truck driver as assistance in putting up the kitchen. Rentals should average not more than $5.00 a stand. Dealers should be helpful in finding free space, although dealers' stores, I think you will agree with me, are unsuitable as locations for demonstrations of this type.

Mr. Osborne tells me that you will want your own men to make the electrical connections for the demonstration in each town along the route. I think this is a good idea, but to be sure that the appliances will work properly, we are going to send Mr. Pierson along with the demonstration for the first week; he will be able to make all necessary adjustments and to instruct the truck driver in care of the appliances.

The itinerary attached does not show the actual dates [fol. 3323] when the demonstration will be held in each town. Mr. Rogers' report should supply this information. We ought also to have the addresses of the locations he will arrange for in each town along the route.

Mr. Guy Thaxton, W. B. Phillips, July 26, 1934

Travelling Demonstration Kitchen—3

It is a rather large order to cover the entire ground in the short time remaining before the 8th. If Mr. Rogers can give us a definite schedule for the first two weeks, it will be sufficient; subsequently he can complete the itinerary over the two months period.

W. B. Phillips.

[fol. 3325] COMPLAINANTS' EXHIBIT No. 675 (Excluded)

Mr. George W. Kable.
G. D. Munger.

October 30, 1934.

Your memo 10/25 to Mr. H. J. C. Pearson.

Your memorandum of October 25, addressed to Mr. Pearson relative to approval of equipment, has been received and Mr. Pearson has asked me to answer certain questions in it.

The news release which you saw relative to financing other than TVA models was approximately as follows: In territory served by TVA power EHFA will finance all domestic models of a manufacturer having a TVA model in his line. You will see that this confines this particular feature to the Mississippi territory at the present time and will be extended to northern Alabama and Knoxville when the transfer is made to TVA of those properties. This policy if flexible and can be changed should it prove to be desirable, for example, while it will apply to ranges, refrigerators, and water heaters it might not apply on some future appliances if the risk involved would not justify it.

In requesting the Industry Division to test pumps for approval by TVA we had in mind to see that they measured [fol. 3326] up to our specifications and that their performance would justify their inclusion in our program. In other words, this testing would be very similar to that which was carried out on water heaters. I believe that we should be constantly seeking ways to lower the cost of high-quality appliances. However, our specifications should be so written that a consumer buying too small a pump for the job it has to do would not place the blame on TVA because it had approved the appliance. If there is any way in which your division can cooperate with us in this matter we would appreciate it.

For your information you will be interested to know that I am today advising the pump manufacturers that we are rejecting their proposals and inviting them to submit new proposals either on the same equipment at a lower price or no new equipment. In view of the contribution which TVA is willing to make towards the popularizing of electric pumps in securing low energy cost and low finance cost it

COMPLAINANTS' EXHIBIT No. 675 (Excluded)

seems to me that the pump manufacturers should be willing to contribute something in the line of price reductions.

G. D. Munger.

Tennessee Valley Authority

Office Memorandum

To: Mr. H. J. C. Pearson, EHFA, Chattanooga, Tennessee.

From: George W. Kable.

Date: October 25, 1934.

Subject: EHFA Approval of Equipment Other Than TVA Models.

A week or more ago I saw a brief news release to the effect that a company had submitted and received approval of a TVA model refrigerator, and that EHFA financing was to be extended to other models of refrigerators made by the same company.

A representative of the Dayton Pump Company was in the office today and wished to know whether this policy would extend to pumps, and if so to what extent it would apply.

This bring- up another point on which I think it would be well for us to have some discussion. It is obvious that our specifications cannot cover all types and sizes of water systems which might be desirable for use in this area. I have in mind particularly some of the lower cost pumps which are being placed on the market just now in order to increase the sales of equipment during this period of low income. This includes shorter stroke, higher speed, deep well pumps of lighter construction that we have specified, [fol. 3328] and designed for use on wells where the water level is only 20′ to 50′ deep, below the section lift of a shallow well pump. There is also the possibility for a considerable demand for the lower cost shallow well pumps of the fresh water type, particularly in suburban communities where the demand for water is relatively low.

COMPLAINANTS' EXHIBIT No. 676 (Excluded)

Some of the companies are interested in pushing these pumps at present, and there is a question whether we should draw up additional specifications to include these in the near future or whether the Industry Division might investigate this equipment from the standpoint of research on lower cost pumps. Our attitude in regard to this problem will be dependent on whether our division is to function merely as a testing agency for determining whether pumps submitted measure up to our specifications, or whether we are to cooperate with EHFA in the future in deciding upon what equipment shall be accepted for EHFA financing.

Contract No. TVHu-8

At the present time there is a contract existing between the Tennessee Valley Authority and the Electric Home and Farm Authority, which contract is numbered TVHu-8 and is dated the first day of July, 1934.

This contract has designated the Tennessee Valley Authority to receive, as agent for Electric Home and Farm Authority, customer paper received from retailers for the sale of approved appliances.

Since April 5 you have been receiving and purchasing for our account paper on appliances other than the so called approved appliances referred to above.

Submitted to you herewith is an amendment to contract TVHu-8, this amendment being known as TVHu-8A. This amendment is being submitted to you in triplicate. Will you please have these copies signed by the individuals who [fol. 3330] signed the original contract, and return them

New Policy

Effective immediately, in the territory described below, the Electric Home and Farm Authority is extending its

financing facilities to include models of electric appliances other than those actually bearing the TVA emblem of approval.

This additional financing service is available on domestic electric ranges, refrigerators, and water heaters where the manufacturer has an approval on one model of the range or refrigerator or water heater being sold. As an example, the Malleable Iron Range Company have an EHFA approval on their Monarch model 15-G domestic range. Up to the present time the model 15-G is the only model in their line of ranges that has been eligible for EHFA financing. Under the new policy all domestic electric ranges manufactured by the Malleable Iron Range Company are eligible for EHFA financing. However, commercial and industrial appliances or equipment are not included in this additional financing service; nor does this mean that the TVA emblem can be carried on any model other than the approved model. [fol. 3333] The territory in which this additional financing service is available is the territory which is supplied with electricity by the Tennessee Valley Authority. The enclosed map and list of cities and communities will indicate that this territory is at present confined to the northeastern area of Mississippi and the City of Athens, Alabama. However, it is expected that the designated area in northwestern Alabama and northeastern Tennessee will be eligible for the additional financing service as soon as negotiations now being conducted are completed.

A copy of this letter and enclosure is being sent to all manufacturers having an EHFA approval in their line, and to all dealers in the northeastern Mississippi territory and Athens, Alabama, which is the territory effected immediately

Very truly yours, Electric Home and Farm Authority, Inc., by G. D. Munger, Commercial Manager.

April 3, 1935

To All Cooperating Utilities, Dealers, Distributors, and Manufacturers:

Effective April 5, 1935, Electric Home and Farm Authority will extend its financing facilities to include the complete line of appliances rather than approved models only. This means that if there is an approved model in the line, EHFA will finance the other models at the standard EHFA financing terms that have heretofore been applicable to approved models only.

In order to preclude the possibility of misunderstanding or confusion, the following is an example of the correct interpretation of this new policy:

Assume Blank Company has received an EHFA approval on its small model refrigerator, which up to this time is the only model that could be financed through EHFA. Under the new policy of financing the complete line, which is effective April 5, EHFA will finance the other models of domestic refrigerators that are manufactured by Blank Company. This same policy of course applies to electric ranges, water heaters, and deep and shallow well pumps.

The territory in which this service will be available is restricted to the area in which EHFA is operating at the present time and is described in detail on the attached sheet.

Very truly yours,

WILLIAM A. SUTHERLAND, COUNSEL

TERRITORY IN WHICH EHFA FINANCING FACILITIES ARE AVAILABLE

Following are the areas in which the financing facilities of Electric Home and Farm Authority are available. In accordance with a recently adopted policy, EHFA will not only finance approved models but will also finance the other domestic models where there is an approved model in the line. This plan will be in effect throughout the entire EHFA territory beginning April 5, 1935.

1. That part of Tennessee which is served with electricity by the Tennessee Electric Power Company and subsidiaries, the Toccoa Electric Power Company of Blue Ridge, Georgia, and the South Kentucky Power Company of Alexandria, Tennessee.

2. That part of Georgia which is served with electricity by the Georgia Power Company.

3. The following individual communities:

Municipally Owned Systems	Privately Owned Systems
Cookeville, Tennessee	Alcoa, Tennessee
Dayton, Tennessee	Etowah, Tennessee
Lebanon, Tennessee	Franklin, Tennessee
Pulaski, Tennessee	
Barnesville, Georgia	
Cartersville, Georgia	
Athens, Alabama	
Amory, Mississippi	County Power Associations
Tupelo, Mississippi	Alcorn County, Mississippi
New Albany, Mississippi	Pontotoc County, Mississippi

4. The Counties of Benton, Tippah, Tishomingo, Prentiss, Lee, Itawamba, Union, and the northern half of Monroe. These counties are all located in northeast Mississippi.

5. Rural lines in western half of [illegible]

[fol. 3336] COMPLAINANTS' EXHIBIT No. 681 (Excluded)

Electric Home and Farm Authority,

Chattanooga, Tennessee

Press Release—for Release at Will

May 22, 1934.

The electric home equipment program of Electric Home and Farm Authority will open May 22, David E. Lilienthal President of EHFA, announced today.

Sales of electric ranges, refrigerators and water heaters carrying the Authority's emblem will begin in all areas served directly by Tennessee Valley Authority power and in the territories served by Commonwealth and Southern Electric utilities in Tennessee, Alabama, and Georgia.

Sale of the emblem appliances on time-payment purchases will be financed by Electric Home and Farm Authority throughout the area affected.

A low finance charge will be made on purchases under the time-payment plan. A single appliance may be financed over a period of three years or less. Purchases of two or more appliances will be financed over a period of four years or less. Down payment and monthly payment on a single purchase will be less than $2.00.

Participation in the plan, Mr. Lilienthal said, is open to all retailers who are approved by the manufacturers of emblem appliances. The retailers wishing to participate will *make appliances. The retailers wishing to participate will* make application to the manufacturer for sale of the financed appliance. On notice from the manufacturer, EHFA will notify the dealer of his approval as a licensed retailer to sell EHFA financed appliances.

All forms and financed charts will be supplied the retailers and utilities by EHFA at no cost.

Once the sale of an emblem appliance is made, Mr. Lilienthal said, the retailer delivers the purchaser's contract to the utility serving the purchaser and the utility pays the retailer the cash-sale price of the appliance less the down payment.

Electric Home and Farm Authority

Press Release—for Release at Will

A finance chart will be given to dealers on which they will determine amount of down payment and monthly install-

COMPLAINANTS' EXHIBIT No. 681 (Excluded)

ment. The utility serving the purchaser will make collection of the monthly installment at the same time the electric [fol. 3337] bill is collected.

Mr. Lilienthal stated that all licensed dealers will be treated alike and that individual makes of EHFA-financed appliances, which will be designated by the presence of the Authority's emblem, will be sold at the same price by all retailers, including merchandising departments of utilities.

The area in which sale of emblem appliances will begin includes virtually all of the state of Georgia, a large part of Alabama, not including Birmingham, and the middle and a part of the eastern section of Tennessee, and including the cities of Nashville and Chattanooga. Sales in the TVA Power area will begin at Tupelo, Mississippi, first municipality to contract for TVA power.

Sales in territory served by other utilities and municipal plants in the Valley states will be authorized upon application of those utilities and adjustment of their rates.

Mr. Lilienthal said that a pamphlet giving a detailed explanation of the retailer's participation in the program is now being printed. This pamphlet, he said, will be given wide distribution in the areas where initial sales operations begin.

Cooperative Extension Work in Agriculture and Home Economics State of Georgia

Athens

July 2, 1935.

Ga. . 7 . Catoosa

Mr. George W. Kable, % M. O. Swanson, Rural Electrification Administrator, 2000 Massachusetts Avenue, Washington, D. C.

DEAR MR. KABLE:

There have just come to my desk a petition signed by 297 farmers of a community in Catoosa County, Georgia, a map of the county showing the proposed rural electrification lines, a list of the names of the farmers who signed the petition, and a letter relative to this proposed project from county agent J. P. Nicholson. A copy of Mr. Nicholson's letter and the other material he sent me are enclosed herewith.

COMPLAINANTS' EXHIBIT No. 684 (Excluded)

At the suggestion of Mr. J. G. Woodruff, Assistant District Agent, who is supervisor of the farm management program looking particularly toward prevention of soil erosion in the Georgia counties that lie in the Tennessee Valley area, I am sending these things to you. Mr. Woodruff tells me that he talked to you about the matter while in Knoxville some days ago. I shall greatly appreciate your presenting the matter as a request from the farmers concerned to Mr. Cook who is in charge of the rural electrification national program.

[fol. 3341] It seems unnecessary for me to say that these farmers are interested in getting electric service. I am approving and passing on their request in the hope that it will be handled as rapidly as possible to the end that this project be gotten underway in accordance with whatever regulations the different agencies concerned may have prescribed. Your assistance in the matter will be greatly appreciated.

Very truly yours, (S.) Harry L. Brown, Director.

enclosures.

[fol. 3342] COMPLAINANTS' EXHIBIT No. 685 (Excluded)

Rural Electrification Administration, Washington, D. C.

GENTLEMEN:

We are submitting herewith two copies of a report regarding a rural electrification project of the North Georgia Electric Membership Corporation. This report was prepared by the Tennessee Valley Authority as a part of its rural electrification activities, and they have very kindly furnished us with copies and consented to our use of them for this purpose.

At this time we should like to make an informal application for the necessary funds for constructing a rural electric distribution system throughout the North Georgia area, as covered by this report. The total estimated cost for constructing such a system is approximately $298,000. This amount covers the construction of approximately 300 miles of rural lines, both single-phase and three-phase, together with necessary transformers, protective equipment, meters,

services, secondaries, and other appurtenances necessary to complete this project. The information embodied in this report is based on the results of a commercial and field survey conducted in March, 1936. The area covered by this survey includes Catoosa, Whitfield, Walker, Chattooga, Gordon, Murray and Dade Counties.

[fol. 3343] The total estimated revenue derived from this proposed system will be approximately $55,000 for the first year's operation, showing an initial ratio of 5.4 to 1, and an annual kilowatt-hours consumption of 1,862,000. According to the income and expense statement which forms a part of the report, the net income before depreciation on the basis of estimated first year revenues is $1,439; on the basis of second year revenues, $7,527; and on the basis of estimated third year revenues, $11,814, in all cases after the payment of interest at 3%. In addition, there will be available for amortization in these years amortization collection of $11,955, $14,510, and $16,945, respectively. On the basis of first year estimates, the loan will be repaid in twenty-five years, on the basis of second year estimates, in twenty-two years and on the third year basis, in twenty years.

In compiling the income and expense statement, as well as in computing the construction cost, Catoosa County and Dade County have been excluded because the Catoosa project is now under construction and is being financed by the Tennessee Valley Authority, and Dade County, because, in our opinion, it shows an inadequate number of customers to justify the construction of any rural lines at this time.

On April 6, 1936, a tentative plan or organization was worked out for the North Georgia Electric Membership Corporation, and subsequently on April 8, a petition for charter for this organization was filed under the Georgia laws. [fol. 3344] A copy of the petition is attached hereto. In accordance with the laws of the State of Georgia, this charter will be granted on or about May 8, 1936.

Therefore, it is our desire at this time to make every effort to obtain all necessary instructions pertaining to the requirements for completing such a loan in order that a contract may be executed at the earliest possible date after the charter has been granted, thereby enabling our organization

to start actual construction of this project immediately. We think that the situation is especially urgent inasmuch as a local power company is attempting to secure enough signatures to warrant the construction of rural lines which will take the cream of our territory and perhaps defeat the whole project, and any substantial delay might alienate enough of our supporters to make such "spite line" construction feasible.

We shall greatly appreciate your prompt reply regarding this subject.

Yours very truly, North Georgia Electric Membership Corporation, by R. C. Pittman, Chairman of the Board.

[fol. 3345] Introduction

This report and the accompanying data is the result of a survey recently completed in North Georgia under the TVA "Neighborhood Plan". The survey was started in January, 1936, under the leadership of the several county agents representing their respective county, including the following:

Catoosa County
Whitfield County
Murray County
Walker County
Chattooga County
Gordon County
Dade County

This survey was completed in March 1936, and at which time all customer applications, together with maps and [fol. 3346] other information, was submitted to the TVA, Chattanooga, Tennessee, for study and to determine the economic soundness and feasibility as viewed from a financial and operating standpoint.

This proposal includes the construction of approximately 300 miles of rural electric lines consisting of 6,900 volt single phase and 11,000 volt 3 phase together with all necessary transformers, meters, services, secondary lines, etc., in accordance approximately with the routes and locations as shown by the accompanying map, at an estimated cost of approximately $298,000.00.

The system would serve approximately 2,000 domestic, commercial and industrial rural customers, using initially approximately 1,852,000 KWH. annually, with an estimated annual gross revenue of $55,000.00.

The area proposed to be developed under this program embraces something like 2,115 square miles, most of which is fertile soil and highly adaptable to diversified agriculture. A total of approximately 12,000 farms with a rural population of approximately 101,000, now without electric service in this area may be served by carrying out such a program and it is conservatively estimated that at least 3,000 rural customers will be receiving electric service from this system within 24 months after completion of the lines. The progressiveness and a desire for better living conditions in this area manifested by the rural people is strikingly noticeable.

[fol. 3347] The principal revenue producing items ranking in the order named are:

Cotton
Dairy products
Peaches and apples

also a rural home enterprise is gaining wide spread recognition through the handicraft work of weaving, and knitting of hook rugs, bed spreads, and other similar articles.

In addition to the agricultural activity, this section has an unusual large number of both large and small industrial plants to whom the rural people may turn for employment during the periods when not engaged in their agricultural activities. Being close to the industrial center of Chattanooga, Dalton, and Calhoun makes it very probable that country homes will be built by a number of the people employed in the large plants. Especially is this true in Walker, Catoosa, Murray, and Whitfield Counties. In Murray County there is under way a Federal Project of building a large lake in the Cherokee National Park and long time leases are being granted in this park to persons wishing to build cabins and homes. The average income per capita in these counties is considerably higher than the average in the south, due to two factors—farm ownership combined with modern and progressive farming, and the location of

industrial plants in the area that helps to supplement the farm income.

This section indicates a large percentage of farm owners [fol. 3348] and operators when compared with the general conditions found in the South. Thus a higher income is enjoyed and subsequently a higher standard of living brought about, electrified and modernized homes and farms will be inevitable.

The proposed operating headquarters for the system will be located in Dalton, Georgia, this is the largest town in the area as well as being the geographic center. The TVA's point of delivery for service to the system will be at a point on the north central Catoosa County line which also is the Tennessee-Georgia state line. The source of supply will be through an interchange between the TVA and the Tennessee Electric Power Company at Ooltewah, Tennessee, located approximately six miles northeast of the described delivery point. This particular section of the line (approximately 6 miles) together with the necessary substation facilities and equipment is being installed by the TVA. This interchange agreement will remain in force until the TVA has completed the construction of its transmission and substation facilities at Chickamauga Dam, at which time the North Georgia proposed system would be served direct from this location.

Particular attention is called to the unusual size of this proposed system which offers a decided advantage from the standpoint of efficient and economical operation—with larger operating units, as this would be, it enables the operators to employ a well trained and efficient operating personnel, to make material and equipment purchases in quantity lots, to economize to the fullest extent through system diversity, [fol. 3349] and the wholesale purchase of energy in large blocks, thereby realizing the greatest benefits, from the low brackets of the wholesale rates.

The appendix to follow embodies the principal figures and factors for further study of the proposed project.

(Appendix omitted.)

[fol. 3350] COMPLAINANTS' EXHIBIT No. 686 (Excluded)

Message by Hill McAlister, Governor of the State of Tennessee, to the General Assembly of Said State on January 22, 1935.

[fol. 3351] To the Honorable Senate and House of Representatives of the Sixty-Ninth General Assembly:

By House Joint Resolution No. 38 passed at the regular session of the Tennessee General Assembly in 1933, I was authorized and directed to appoint a committee of six outstanding citizens, two from each grand division of the State, to be designated as the "Tennessee Valley Commission." The duties of this body are specified in said resolution, and, in brief, authorize them to represent the State of Tennessee in matters pertaining to the development of Muscle Shoals and the Tennessee Valley and to cooperate with the Federal Government in such matters, and to study the benefits that may be derived by Tennessee from such development, and to make a comprehensive survey of the possibility of obtaining cheaper power or electric rates for the citizens of Tennessee and to report to the Governor and legislature all necessary legislation needed to protect the interest of the people of this State.

In conformity with the direction contained in said joint resolution, I appointed the following citizens as the members of the said commission. From East Tennessee Hon. D. C. Webb of Knox County and Hon. John A. Chambliss of Hamilton County. From Middle Tennessee Hon. A. J. Dyer of Davidson County and Hon. W. R. Rackley of Giles County. From West Tennessee Hon. C. E. Pigford of Madison County and Hon. Wm. W. Goodman of Shelby County.

These gentlemen promptly undertook the duties specified and met within the Tennessee Valley Authority Commissioners in their offices in Knoxville early in April 1934. At this meeting, at which I had the honor to be present, the ways in which this commission so appointed by me could be helpful to the Tennessee Valley Authority were discussed at length. It was then pointed out by the Tennessee Valley Authority Commissioners that the Federal Government was deeply interested in the creation of planning [fol. 3352] boards within the various states, and that it would be helpful if I, as Governor, would create such a board in Tennessee to work in connection with the Ten-

nessee Valley Authority, and, likewise, with the Federal Planning Board already created by President Roosevelt. I accordingly designated the six members of the Tennessee Valley Commission, appointed by me as aforesaid, as the Tennessee Planning Board, and they have been functioning also in that capacity ever since. They have been in constant touch not only with the Tennessee Valley Authority but also with Federal Planning Board authorities and with the office of the Secretary of the Interior, from each of which organizations they have received suggestion and recommendations for the enactment of laws in Tennessee that would serve the purposes that the Federal Government now has in view in the various states of the Union in carrying out the national recovery program.

In conformity with the requirement of said House Joint Resolution No. 38 the said commission so appointed by me has reported as follows:

"In accordance with joint resolution thirty-eight (38) of the General Assembly of the State of Tennessee of 1933, creating the Tennessee Valley Commission, we have formulated a legislative program to operate with the Tennessee Valley Authority, and we do hereby report that the enclosed bills are recommended by us for passage.

"All of these bills have been approved by the Tennessee Valley Authority, and the Tennessee Valley Authority feels that the passage of all these bills will materially expedite the extension of the planning electric, navigation, housing and other phases of the Tennessee Valley Authority's program within the State of Tennessee.

"In addition, Bill No. 12, relating to the creating of Housing Authorities, has been approved by the National Association of Housing Officials, on behalf of the Federal Emergency Administration of Public Works.

"Since some of the counties or municipalities of the State may wish to use Federal funds to enable them to operate under the Municipal Electric Plant Act, being known as Our Bill No. 7, we have deemed it desirable to secure the Public Works Administration's approval of the form and substance of this bill. We have been notified that the Public Works Administration does approve same.

COMPLAINANTS' EXHIBIT No. 686 (Excluded)

"It is not unlikely that additional supplemental legislation will be recommended by us for passage, before the end of the present session of the legislature, to cooperate fur- [fol. 3353] ther with the Tennessee Valley Authority. We deem the enclosed bills so important, however, that we are now forwarding them to you, in the hope that all of said bills can be passed at an early date, pending the formulation of supplemental bills."

The bills referred to in this report may be briefly described as follows:

(1) A bill that will authorize the various counties, incorporated cities and towns of Tennessee to construct, purchase or otherwise acquire and operate electric generating, or distribution systems, and to enable such counties, incorporated cities and towns to utilize the surplus power generated by the Tennessee Valley Authority dams.

(2) An Act to authorize municipal corporations, counties, towns and cities owning and operating electric generating transmission or distribution systems, to stipulate in any contract they may desire to make with the Tennessee Valley Authority, or other similar governmental agency, such covenants, terms and conditions as the governing power of such municipal corporations, counties, towns and cities may deem appropriate.

(3) An Act to authorize the Highway Department of Tennessee to purchase or construct and operate landing and loading facilities on the navigable waters of the State, in connection with State Highway facilities parallel to and intersecting such navigable waters.

(4) An Act to define the jurisdiction of the Railroad and Public Utilities Commission so as to exempt therefrom certain Federal and State corporations, agencies, instrumentalities and other public bodies and certain non-profit organizations defined as non-utilities and also to authorize utilities to sell or otherwise dispose of their property to non-utilities.

(5) An Act regulating appeals or reviews of the judgments of the Railroad and Public Utilities Commission.

COMPLAINANTS' EXHIBIT No. 686 (Excluded)

(6) A bill to provide for the creation and establishment of a State Planning Commission for the State of Tennessee.

(7) A bill to provide for the regulation of and for the approval by regional planning commissions before filing for record of plots of the sub-division of land outside the boundaries of municipal corporations.

(8) To empower county courts to provide for the establishment of districts or zones within portions of counties which lie outside of municipal corporations, and to empower County Courts to regulate within such zones the location, height and size of buildings and structures, etc.

(9) An Act to empower municipalities to provide for the establishment of municipal planning commissions.

(10) A bill to empower municipalities to provide for the establishment of districts or zones within the corporate limits for the purpose of regulating within such districts, the location, height, and size of buildings, etc.

[fol. 3354] (11) A bill to provide for the regulation and approval by municipal planning commissions before filing for record of plots of the sub-division of lands lying within such municipalities.

(12) A bill to promote the public health, safety, morals and general welfare by providing for the establishment of housing authorities designed to eliminate unsanitary and dangerous housing conditions by providing for the construction, operation, supervision or safe and sanitary dwellings.

The bills referred to in this report, as indicated therein, were carefully prepared under the direction of the Tennessee Planning Board with the aid of counsel designated and recommended by the Secretary of the Interior, and they follow, as I am informed, the lines that are desired by the Secretary of the Interior, through whose office must pass the various requests that may be made of the Federal Government for the financial assistance that will doubtless be necessary in many instances to enable Tennessee counties, cities and towns to obtain the full benefit of what is being done at this time by the Tennessee Valley Authority. The

COMPLAINANTS' EXHIBIT No. 686 (Excluded)

first five of these acts deal primarily with conditions affecting immediately the work of the Tennessee Valley Authority and the others are enabling acts designed to give the State its counties and cities and towns the benefit of the planning Board activities of the National Government both through the work of the Tennessee Valley Authority as well as in other ways. I have recently received letters from the Hon. Harold L. Ickes, Secretary of the Interior, in which he recommends the enactment of these bills into law, and requests that copies of them, when so enacted, be promptly furnished his office.

It is unnecessary for me to emphasize at this time the importance of thorough cooperation between the State of Tennessee and its various counties, cities and towns on the one hand, and the Tennessee Valley Authority on the other. The Tennessee Valley Authority was created by act of Congress in May 1933 and has been functioning in our State for more than a year and a half. The time of actual [fol. 3355] realization of the tremendous benefits expected to be derived from the expenditure in Tennessee of the great sums that have been made available by Congress for the work of this authority, is rapidly approaching. The bills that I have referred to above have been drawn to give this cooperation. They were introduced in both of your honorable bodies on last Friday, and I am taking this opportunity of especially directing your attention to them and of recommending their prompt enactment.

Respectfully,

Hill McAlister, Governor.

[fol. 3356] COMPLAINANTS' EXHIBIT No. 687 (Excluded)

Message by Hill McAlister, Governor of the State of Tennessee, to the General Assembly of Said State on April 8, 1935

[fol. 3357] To the Honorable Senate and House of Representatives of the Sixty-Ninth General Assembly:

GENTLEMEN:

I have received from the Honorable Harold L. Ickes, National Public Works Administrator, a series of fourteen

(14) bills which he requests that I lay before your honorable bodies for enactment into laws. These bills are intended to aid the National Public Works Administration in the expenditure in our State of the large sum of money that it is expected will be allocated to Tennessee from the Public Works bill finally enacted by Congress a few days ago, and which now awaits the signature of the President.

These Acts are described in the letter of Secretary Ickes to me as follows:

(1) "An Act entitled, 'An Act authorizing incorporated cities and incorporated towns to construct, acquire, improve, extend, operate and maintain public works, undertakings and projects; prescribing mode of procedure for and regulating the issuance and sale of bonds and other obligations to finance such works, undertakings and projects, providing for the payment of such bonds and other obligations; and authorizing agreements with the holders of such bonds and other obligations.'

(2) "An Act entitled, 'An Act authorizing counties to construct, acquire, improve, extend, operate and maintain public works, undertakings and projects; prescribing the mode of procedure for and regulating the issuance and sale of bonds and other obligations to finance such works, undertakings, and projects, providing for the payment of such bonds and other obligations; and authorizing agreements with the holders of such bonds and other obligations.'

(3) "An Act, entitled, 'An Act providing for the acquisition, purchase, construction, reconstruction, improvement, betterment, extension, operation, and maintenance of revenue producing public works by any incorporated city or town; authorizing and regulating the issuance of revenue bonds for financing such public works; and providing for the payment of such bonds and the rights of holders thereof.'

(4) "An Act entitled, 'An Act simplifying the procedure for the construction and financing of public works projects by municipalities, enabling municipalities to make and perform contracts with federal agencies relating to the con- [fol. 3358] struction and financing of such projects and conferring additional powers upon municipalities.'

COMPLAINANTS' EXHIBIT No. 687 (Excluded)

(5) "An Act entitled, 'An Act validating, ratifying, approving and confirming all bonds, notes, warrants and other instruments, obligations, and/or evidences of indebtedness heretofore issued and sold by any incorporated city or town, county or special taxing district to the United States of America or any agency or instrumentality thereof.'

(6) "An Act entitled, 'An Act validating, ratifying, approving and confirming all agreements heretofore entered into between incorporated cities or towns, counties and/or special taxing districts of this state and the United States of America for the making of any loan and/or grant under the National Industrial Recovery Act, and all proceedings taken in performance, in whole or in part, of any such agreements, including the authorization of any bonds, notes, warrants and other instruments, obligations and/or evidences of indebtedness, and authorizing completion of all such proceedings, including the issuance, sale and delivery of such bonds.'

(7) "An Act entitled, 'An Act to amend an act entitled "An Act providing for the creation and establishment for the State of Tennessee of a State Board for Licensing General Contractors; providing for the appointment and qualification of the members and the organizations and jurisdiction thereof; for the purpose of safeguarding life, health and property, and of promoting public welfare by requiring that only properly qualified persons shall engage in general contracting; prescribing the duties of and the grant of powers to said Board to issue certificates of license and to regulate the practice of general contracting in the State of Tennessee, to fix the standards of qualification and eligibility for the practice thereof; to authorize the collection and expenditure of fees for the purpose of this Act, and to make all such legal rules and regulations necessary and proper to carry out the purpose of this Act; and providing penalties for violation of this Act," approved July 2, 1931 and being Chapter 70 of the Public Acts of the General Assembly of Tennessee of 1931, to provide that the provisions of said Act shall not apply to any public work or project financed in whole or in part by a loan or grant or both from the United States of America, or any agency or instrumentality thereof.'

COMPLAINANTS' EXHIBIT No. 687 (Excluded)

(8) "An Act entitled, 'An Act to constitute and confirm certain educational institutions of the State as separate legal entities; to confer powers upon such educational institutions, including the powers to purchase, construct, better and equip buildings and to make other improvements to their plants, and for such purposes to borrow money and accept grants from any federal agency; to issue bonds and to provide for the payment of such bonds and interest thereon and to secure such payment; to confer further [fol. 3359] powers for the making of agreements with the holders of such bonds; to supersede inconsistent provisions of all other laws; and to declare an emergency.'

(9) "An Act entitled, 'An Act to declare the necessity of creating public bodies corporate and politic to be known as housing authorities to engage in slum clearance and/or projects to provide dwelling accommodations, for persons of low income; to provide for the creation of such housing authorities; to define the powers and duties of housing authorities and to provide for the exercise of such powers, including acquiring property by purchase, gift or eminent domain, and including borrowing money, issuing revenue and credit bonds and other obligations, and giving security therefor; to confer remedies on obligees of housing authorities; to provide that the bonds of the authority shall be legal investments; and to declare that this act take effect from the date of its passage.'

(10) "An Act entitled, 'An Act to authorize cities and towns and the State, its subdivisions and agencies to cooperate with housing authorities and the United States of America by rendering services, conveying or leasing property, and providing for streets, roads and other facilities, and otherwise; and to declare that this act take effect from the date of its passage.'

(11) "An Act entitled, 'An Act to authorize corporate agencies of the United States and corporations receiving aid from the United States to exercise the power of eminent domain to acquire property for housing projects; and to declare that this act take effect from the date of its passage.'

(12) "An Act entitled, 'An Act creating the Rural Electrification Authority of Tennessee for the purpose of pro-

moting and encouraging the fullest possible use of electric energy in the State by making electric energy available to certain inhabitants of the State at the lowest cost consistent with sound economy and prudent management; authorizing the Authority to sell and distribute electric energy and to construct or otherwise acquire a system or systems for the generation, transmission and distribution of electric energy to carry out the purposes of this Act; providing for the rights, powers and duties of the Authority; authorizing and regulating the issuance of bonds by the Authority; and providing for the payment of such bonds and the rights of the holders thereof.'

(13) "An Act entitled, 'An Act providing for the creation of power districts; prescribing powers and duties of such districts, and authorizing such districts to conduct and operate utilities for the production, transmission or distribution of electric energy, and to issue bonds and providing for the payment of such bonds.'

[fol. 3360] (14) "An Act entitled, 'An Act providing for the formation of non-profit membership corporations to be known as Electric Membership Corporations for the purpose of promoting and encouraging the fullest possible use of electric energy by making electric energy available at the lowest cost consistent with sound economy and prudent management of the business of such corporations; providing for the rights, powers and duties of such corporations; authorizing and regulating the issuance of bonds by such corporations and providing for the payment of such bonds and the rights of the holders thereof'."

The specific purposes which the Public Works Administrator has in mind in asking for the enactment of these laws are further described in his letter as follows:

"The first bill, which may be cited as the Public Works Act of 1935, confers powers upon cities and towns to engage in public works projects which it is not clear that present laws permit them to undertake. The powers of cities and towns to borrow money and issue bonds are also clarified and placed in a single comprehensive act. Similar bills enacted into laws in other states have proved very helpful.

"The second bill, which may be cited as the County Pub-

lic Works act of 1935, confers powers upon counties to construct and finance public works projects which are appropriate to the corporate purposes of counties, and is analogous to the first bill.

"The third bill, which may be cited as The Revenue Bond Act of 1935, authorizes the issuance of bonds by cities and towns for the purpose of financing the construction of revenue-producing undertakings, such bonds being payable solely from the revenues of such undertaking, without recourse to tax levies, legislation similar to this bill has been enacted in more than thirty states.

"The fourth bill, which may be cited as The Municipal Emergency Procedure Act of 1935, applies to counties, cities, towns, and special taxing districts. Its purpose is to eliminate technical difficulties which tend to impede the closing of loans from the Public Works Administration, to delay the beginning of construction on Public Works projects, and to obstruct the carrying out of the rules and regulations prescribed by the Administration.

"The fifth bill, which may be cited as the 1935 Validating Act, is intended to validate bonds which have been purchased by the Public Works Administration. You will recall that as funds were advanced to each applicant you addressed a letter to me in which you stated that you would be glad to cooperate in securing legislation to validate any defects or irregularities in connection with the specific project then in question. Rather than give you a number of validating bills, it has seemed more convenient and equally as effective to draft a single bill covering all bonds heretofore issued to the Government.

[fol. 3361] "The sixth bill does not relate to the validation of bonds which have already been purchased by the Administration but is concerned with the validation of loan and grant agreements between the United States and cities, towns, counties and special taxing districts of Tennessee, and also with the validation of election and other proceedings heretofore taken by such municipalities which are defective to such an extent that unless the proceedings are ratified by this curative bill, it may be necessary to request that the proceedings in certain cases be taken again.

"The seventh bill amends the act which establishes State board for licensing general contractors by providing that

the act shall not apply to public works projects. I recognize the fact that this is a matter of state policy and I want to make it clear that the fact that I am suggesting this bill is not in any way intended as a criticism of the State Licensing Board. Our experience has indicated that the act is equitably administered and we have received splendid cooperation from the Board. The limitations of the act, however, are such that the field of competition is seriously restricted. Much may be said in favor of the licensing act which this bill amends, but the reasons for the licensing of contractors do not exist to the same degree in the case of projects financed by the Public Works Administration which are under constant supervision by our engineer inspectors.

"The eighth bill is intended to authorize state educational institutions to borrow money for the purpose of constructing revenue producing improvements and to issue bonds payable solely from the revenue of such improvements. Similar legislation has been enacted in several states. The bill presents some constitutional questions which may ultimately have to be determined by the Supreme Court of Tennessee.

"The ninth, tenth and eleventh bills, if enacted into law, will provide enabling legislation pursuant to which public bodies in your State will be able to participate in a Federal low-cost housing program. These bills involve certain matters of legislative policy which may require adjustment to meet local needs. You undoubtedly will desire to make certain changes and I suggest that you communicate with Colonel Horatio B. Hackett, Director of the Housing Division of the Public Works Administration, in regard thereto.

"The twelfth, thirteenth and fourteenth bills, which may be cited respectively as the State Rural Electrification Authority Act, the Power District Law and the Electric Membership Corporation Act, illustrate different methods of attacking the problem of encouraging the fullest possible use of electric energy in the State."

An examination of each of these bills will reveal that they are emergency measures, and expire by their own limitations June 30th, 1937. They are intended to obviate legal difficulties that the National Public Works Administration

has encountered during the last year and a half in the ex-
[fol. 3362] penditure of such funds in Tennessee.

The eighth of these bills, as enumerated in the letter of Secretary Ickes to me, would be unconstitutional if enacted in its present form, as I am advised by Attorney General Beeler. If the substance of the measure should be agreed to by your honorable bodies, it must be put in a radically different form.

The bills numbered nine, ten and eleven are measures designed to further the Housing program of the Federal Government, and are intended to take the place of a bill on this subject introduced prior to the legislative recess, and the final enactment of which was delayed at the request of agents of the Public Works Administrator. The bills on this subject now laid before you only apply to municipal corporations having a population of twenty thousand and over.

The bills numbered 12, 13 and 14 are three bills that are designed to give rural sections of Tennessee the benefit of the cheap electric power to be generated by the Tennessee Valley Authority in our State. I have submitted them to the Tennessee Valley Authority and they recommend their enactment, though it is possible that they will desire hereafter to make certain changes from their present form.

The bills numbered 1 and 2 of the series now submitted to you, confer for two years additional emergency powers upon cities and towns of Tennessee to issue bonds with which to aid the Federal program for the construction of such municipal public works. In addition to already existing charter powers, the powers that municipal corporations now have in our State on this subject are set forth in Sections 3608 of the Code of 1931. So far as the additional powers sought to be given cities and towns under Act No. 1 are concerned, it seems to me that it would be more easily accomplished by an amendment to these sections which have been upon the statute books of our State since 1917. How-
[fol. 3363] ever, I transmit the Act to you in the form in which it has been drafted at Washington, and as recommended to me by the Public Works Administrator.

It should be pointed out, however, that the powers sought to be conferred upon the various counties of Tennessee by Bill No. 2 do not already exist under general laws of the

State, as is the case with municipal corporations. In order to confer general powers upon counties to issue bonds for the purposes named, it would either be necessary to enact this Bill No. 2 or to extend the provisions of Section 3696 to 3708 of the Code to counties.

There will doubtless be differences of opinion among you as to the wisdom of the enactment of several of these bills. It is certain that you will desire to amend some of them. I recommend their enactment to you in view of the grave emergency that exists in the State.

The National Government, by the enactment of the large Public Works Appropriation bill, which has been before Congress for a number of weeks, now proposes to deal with the unemployment problem in the nation in a manner quite different from the way in which it has been dealt with during the last two years. It is the purpose of the President now to relieve this situation by putting men to work in the construction of public works enterprises on a scale not heretofore possible. Tennessee has already sent to the National Administrator, a long list of public works which it is hoped will be undertaken with funds appropriate in the bill before mentioned.

The President has not as yet indicated in just what manner the sum carried by the bill will be allocated to the several States, nor the details of the method of its expenditure, but it was in anticipation of the enactment of this Public Works measure soon to be signed by the President that all of the bills now transmitted to you were prepared by the Public [fol. 3364] Works Administrator at Washington.

You are shortly to adjourn and it would be a calamity of Tennessee if we failed to obtain the allotments that would otherwise be given to us by our failure to meet the conditions requested by the National Administrator.

I respectfully urge upon your honorable bodies the prompt reference of these bills to your appropriate committees and their enactment into law, as is requested by Secretary Ickes.

Respectfully, (Signed) Hill McAlister, Governor.

Nashville, Tennessee, this 8th day of April, 1935.

TVA Minutes, July 11, 1933.

"The discussion raised the issue of whether the Authority should seek an area arrangement with the Commonwealth & Southern Corporation under which the Authority would refrain from serving municipalities outside a particular area, provided the Commonwealth & Southern Corporation would refrain from operating within the area to be served by the Authority. It was suggested on the one hand that the arrangement was worth attempting; that it would be feasible; and that it would carry into effect the purposes of the President. On the other hand, it was pointed out that such an area arrangement was impracticable; that general co-operation from utilities could not be anticipated in view of the adverse effect such policy would have upon their position; that such a commitment would be premature at this time; that such an area arrangement would probably require many municipalities to acquire [fol. 3381] a distribution system, a long and slow process; that other municipalities outside such area in the meantime, would be denied service unnecessarily; and that much valuable time would be lost which should be devoted to carrying forward the objectives of the Corporation. As an alternative, David E. Lilienthal proposed that immedi-

COMPLAINANTS' EXHIBIT No. 702 (Excluded).

ate steps be taken to enter into wholesale power contracts with the cities of Florence, Tuscumbia and Sheffield, Alabama, using these municipalities as a proving ground and entering wedge. He suggested that the Authority's subsequent course be determined by events as they develop."

[fol. 3382] COMPLAINANTS' EXHIBIT No. 703 (Excluded).

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) 532:

TVA Minutes, July 30, 1933.

"Policies concerned with the power project were discussed. The question arose as to whether friendly attempts should be made to buy out power companies or whether the Authority should refuse to deal with them. It was suggested that the views of President Roosevelt and Senator Norris be obtained on this point.

Arthur E. Morgan proposed that an area be delimited roughly equal in size and corresponding in many respects to the Tennessee River drainage basin, in which the Tennessee Valley Authority might buy up the private power company properties. Under this proposal the Authority would have a clear field in which to operate.

It was suggested that a study be made of this proposal and of the cost involved. David E. Lilienthal was authorized to make such investigation and to employ as much help as is needed for this and other power studies to be made by him. It was understood that before the key posi-
[fol. 3383] tions are filled the names of applicants for these positions must be submitted to the Board for approval.

The Aurora power project, which comes before the Federal Power Commission for decision August 17, was discussed. Arthur E. Morgan suggested that it might be well for the Tennessee Valley Authority to condemn the Aurora and Tennessee sites, as well as all other sites located by the Army Engineers, in order that the Tennessee Valley Authority would have control of future power developments in the area.

COMPLAINANTS' EXHIBIT No. 703 (Excluded.)

David E. Lilienthal suggested that wholesale power rates be definitely worked out on a conservatively basis for the three communities near Muscle Shoals.

Construction of a transmission line from the Muscle Shoals plants to the Cove Creek Dam site was discussed by the Board which gave careful consideration to the time needed to build the line and to the engineering staff required to supervise its construction. The Board adopted the following resolution:

[fol. 3384] 'Resolved, that at the earliest possible date the Board proceed with the construction of a transmission line from Wilson Dam to Cove Creek Dam site, to provide power for construction purposes and for distribution to cities, counties and municipalities as from time to time may be necessary or desirable.'

In reaching this conclusion, it was pointed out that a tie-line connecting Muscle Shoals and Cove Creek Dam was essential to co-ordinated operation of the two power plants and that existing transmission lines of private companies were too circuitous and not feasible otherwise. The decision to construct the tie-line was based upon the following facts: That low prices now exist but higher prices are predicted; that a considerable number of applications for power service from communities located near the transmission line have been received; that the need for power at Cove Creek for construction work is imperative; and that the demand for employment is great."

[fol. 3385] COMPLAINANTS' EXHIBIT No. 704 (Excluded)

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 534:

TVA Minutes, September 18, 1933.

"The chairman discussed the possibility of constructing the General Joe Wheeler Dam in the near future. He stressed the need for having available complete information on other projects, such as the Aurora Landing and Chickamauga Dams, so the Board would be in position to deal with proposals regarding such projects. David E. Lilienthal pointed out a conflict of interests in this connection, suggesting that the Corporation must not ruin its power market by making available at once extraordinarily large amounts of power, but that it must be ready to deal with questions regarding these projects as they arise. He suggested that the cost of the preliminary investigations and construction work on such projects should, insofar as consistent, be allocated against navigation and unemployment relief and not alone against the power project. The Chairman concurred in this, stating that the Authority should not accept unwarranted charges against the power development. Harcourt A. Morgan warned the Board [fol. 3387] that Congress may force the Authority to build other dams as an emergency measure. He suggested that the Board make reasonable preparations in anticipation of such action. It was decided that the Chairman should see Senator Bankhead and discuss with him the policy of the Public Works Administration about the possible construction of other dams. David E. Lilienthal will consider various projects which have been suggested to get a general picture of possibilities and report at a future meeting."

[fol. 3388] COMPLAINANTS' EXHIBIT No. 706 (Excluded)

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 535:

TVA Minutes, September 21, 1933

"The Board discussed what its policy should be with reference to the proposed construction of the General Joe

Wheeler Dam with funds to be supplied by the Public Works Administration. David E. Lilienthal submitted a proposed statement of policy which has been approved by the Board. A true copy of the statement labeled exhibit 9-21-33-b, is attached to these minutes and made a part hereof.

The proposed statement of policy attached to the foregoing minutes is exhibit No. 9-31-33-b, which is as follows:

Statement of Policy

Part I.

The Authority has been requested by public agencies by members of Congress representing this area, by leading citizens and by private groups to cooperate and participate in securing funds from the Public Works Administration to be devoted to various public works projects intended to provide unemployment relief.

1. In General. The Board, of course, being a public agency heartily favors large expenditures within the Ten- [fol. 3389] nessee Valley to relieve the acute distress which exists because of the depressed state of industry and agriculture. Few agencies are in a position to know more intimately the acuteness of this situation, and therefore, few can feel more strongly the dire need of adopting every measure of reemployment.

2. Power and Navigation Dams to be constructed and held by the Authority.

The Board conceives that the power phase of the Authority's work was intended by Congress to operate on business principles and was to be self-liquidating and self-supporting. Therefore, if the Board were to construct additional facilities for power production in the way of power dams, this would result in additions to capital account against which heavy fixed charges will run. The Board is now spending from its appropriation, substantial sums in the construction of Norris Dam and in the construction of a transmission line between Wilson and Norris Dam-. If business principles are to be observed as the policy of Congress requires, then the

Board should not expend further sums than those indicated [fol. 3390] applicable to Norris Dam and the transmission line for power production purposes, until a market has been found which will support the existing investment and the investment now being made in Norris Dam and the transmission line.

To add further to the Authority's fixed capital charges by way of additional construction of power dams, until a market has been found for existing investment might make the conduct of the power project of the Authority impossible on a self-supporting basis for many years to come. Such a result might well imperil the future, not only of the power project but of the broad plan of the Tennessee Valley Authority Act.

If, however, the construction of additional dams by the Authority is explicitly treated as a reemployment measure, then the Authority would be pleased to proceed with such construction as rapidly as possible, provided the funds are supplied from the funds of the Public Works Administration appropriated for industrial recovery purposes, and provided further that in our accounting it is understood that additional dam facilities are needed for power purposes [fol. 3391] the additional investment will not be carried as a power investment of the Authority, but would be treated as any expenditure for other public works enterprise, chargeable against the Public Works Administration and for the purposes of that administration. Then when such dam becomes useful, because of the market situation, for power production by the Authority, the Authority would then and not until then begin to be charged with the investment and the fixed charges applicable thereto.

Subject to these qualifications, the Board of Directors heartily approves the immediate construction of Dam No. 3, as an unemployment relief measure. An important consideration in our conclusion is the fact that the construction of Dam No. 3 will be a substantial aid to navigation on the Tennessee River below Chattanooga. Navigation locks are, in fact, now in process of construction by the Army Engineers at Dam No. 3. This position we conceive to be in the interest of the public welfare.

COMPLAINANTS' EXHIBIT No. 706 (Excluded)

[fol. 3392] Part Two

Power dams to be constructed with Public Works money by public agencies other than the Authority or by private agencies using Public Works money.

If the Tennessee Valley Authority power program is to function as a business enterprise as Congress has directed, it must secure a reasonably adequate market in which to sell the power it has available.

It is now proposed that there be constructed within the Authority's market area, additional power facilities, primarily as an unemployment relief measure. Whatever the primary purpose, the effect would be to add further public power facilities to those already existing and in process of construction by the Authority. These additional facilities would be paid for principally from the same source as are the funds with which the Authority operates, namely, public monies. Such further facilities would be constructed on a public stream over which the Authority has been given responsibility, that its development shall be according to a plan formulated and executed by the Authority. On the one hand, therefore, Congress has directed the Authority to operate certain existing and future power facilities on a [fol. 3393] self-supporting basis, which implies the acquisition of a market. On the other hand, the proposal of additional construction at this time would add to the publicly financed power facilities in the same market area in such a way as to render more difficult of accomplishment the direction of Congress that the power development functions of the Authority function on a self-supporting basis. The addition of other publicly financed power facilities in the Authority's market area will make more difficult the attachment of a market adequate to support the Authority's present facilities or facilities in process of construction. In short, the effect would be that in one enactment Congress would tend to negative another enactment in the same session.

Therefore, we do not approve the construction of any dams for the production of power within the Tennessee Valley by agencies other than the Authority with public funds, at least until Muscle Shoals and Norris Dam's power has been marketed by the Authority. For these reasons, we have [fol. 3394] concluded to disapprove all Governmental loans

COMPLAINANTS' EXHIBIT No. 706 (Excluded)

for the production of additional power within the area of the Tennessee Valley.

We are of the opinion that, in general, to carry through the objective of the Tennessee Valley Act, of an integrated development of economic resources of the region, it is imperative that the water power resources be developed as a single system, with single ownership and control. While concrete cases may arise in which this principle would not apply, the rule, we believe, is generally sound."

"The minutes of said Board of the meeting held September 21, 1933, recites that a telegram was sent to Secretary Ickes advising that TVA approved the construction of Dam No. 3 'as an emergency employment relief measure, on condition that it is built with Public Works money and not with TVA money, that the carrying charges and construction costs shall not be charged to the TVA until the demand for power justifies the construction for the purpose. The dam is an integral part of the navigation program for the Tennes- [fol. 3395] see River, and will be a part of the power development program when it is needed—this position we conceive to be in the interest of the public welfare. The Board of Directors of the Tennessee Valley Authority took formal action to this effect."

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 535:

TVA Minutes, September 29, 1933

This excerpt relates to application by a committee from Hamilton County, Tennessee, relative to the construction of Chickamauga Dam, proposing that TVA construct the dam with funds to be secured by Hamilton County under a contract with TVA for the latter's control and operation of the dam, such dam to make provision for future installation of power facilities. The Board adopted a resolution concurring in the suggestion based on the securing of the funds by Hamilton County, the dam to be purchased from Hamilton

COMPLAINANTS' EXHIBIT No. 707 (Excluded)

County, "on the basis of fair value" if Congress authorized TVA to do so and its discretion determines this course. It was to be understood that there would be no power operation of the dam by Hamilton County or any other agency "unless or until the Tennessee Valley Authority agrees, or unless operation is done directly by the Tennessee Valley Authority by recapture."

[fol. 3397] The resolution continued with this clause:

"It is understood that the participation of the Tennessee Valley Authority in its present construction is only to enable the county to carry on its unemployment relief program, and not because of present necessity of the dam."

[fol. 3398] COMPLAINANTS' EXHIBIT No. 708 (Excluded).

TVA Minutes, October 13, 1933.

"David E. Lilienthal submitted a memorandum entitled 'basis for negotiation' which might serve as the basis for negotiations with private utilities. A copy of the memorandum is attached and made a part of these minutes. Alternative #1, proposing the sale of entire power output of the Authority to the private utility, subject to instruction as to the resale price in accordance with section 12 of the Act, is in the opinion of the Board not open to the Authority and that negotiations on this basis cannot be entered into. Alternative #2, proposing an agreement with the private utilities binding the Authority to confine its operations within a certain definite territory, was not considered by the Board to be a satisfactory basis for negotiations with privately owned utilities, and a definite binding agreement limiting the Authority's operations was not feasible as a matter of law or policy.

The Board was reminded of President Roosevelt's [fol. 3399] desire that the Authority's power operations be centered in a delimited area. The idea of dividing territory between privately owned utilities and the Authority

met with the approval of the Board but the suggestion that the Authority be excluded from operating in certain areas was disapproved.

David E. Lilienthal called attention to an area in northeastern Mississippi which he recommended as an excellent place for the Authority to start the development of a sound power program and recommended that this area be included in the Authority's operations. The Board was of the opinion that requests for power from areas contiguous to the Valley area should not be turned down, especially when such areas are near the power generating site.

The question was raised as to whether or not the power program which is being set up will provide a yardstick which can be applied with accuracy to the power industry. The consensus of opinion was that an accurate yardstick might be developed within three or four years if the Authority's power operations can be centered in a delimited area.

[fol. 3400] Arthur E. Morgan suggested that the Authority issue a statement of policy which would put it in a position of making a fair and practical attempt in a delimited area to develop a real yardstick which could be applied to the power industry.

David E. Lilienthal stressed the fact that the Authority must work towards an increase in the use of electricity as its main power outlet and that increased uses of current would benefit both the utility companies and the Authority. He called attention to the possibility of marketing electrical appliances and suggested that the Authority get permission from Congress to do this. This proposal met with the general approval of the Board. The Board decided to proceed with its program for furnishing power to three cities at Muscle Shoals and to the territory near Tupelo, Mississippi."

Attached to and made a part of these minutes of the meeting of the Board of Directors of the Tennessee Valley Authority held October 13, 1933, is an exhibit designated as exhibit 10-13-33-a—"Basis for negotiation" to the following effect:

[fol. 3401] "(A) That two major holding companies, the Commonwealth & Southern Corporation and the Electric Bond & Share Company own a network of transmission

lines and distribution systems, together with generating facilities within the area of operations of the Tennessee Valley Authority. In the scale of rates charged by these companies these facilities are more than ample to meet existing effective demand for electric service and represent an investment of many millions of dollars. A substantial, and perhaps the major, part of the securities issued to finance these facilities are in the hands of the public.

"(B) The Tennessee Valley Authority has available about 105,000 KW of firm power at Muscle Shoals and with the completion of Norris Dam this will be more than doubled. The existing demand is being adequately supplied by privately owned utilities. There are only two ways whereby the Authority can dispose of this additional block of power: (1) Sale in bulk to the private utilities. Since these utilities have now adequate supplies, this alternative [fol. 3402] implies the creation of additional demand consequent upon either a substantial industrial development or a substantial increase in domestic farm use, rendering existing privately owned facilities inadequate. Distribution would continue to be through the facilities of existing companies. Rates to the ultimate consumer of power purchased from the Authority would be regulated by the Authority under terms of the contract of purchase.

(2) By the sale of such power to the municipalities or to the public agencies which are now being served by private utilities. The Authority might dispose of its power by taking part of the field now occupied and served by the existing utilities. Since there are few municipalities in the area which own their distribution systems such a method of disposing of the Authority's power would involve the acquisition by such municipalities of the distribution facilities now owned by the utilities or the construction of competing facilities. The statute contemplates both the above methods [fol. 3403] of disposing of the Authority's power; that is, sale to the existing utilities and invasion of the field now occupied by the utilities, but the primary method is distribution to and through public agencies.

(C) President Roosevelt has uttered publicly that one of the functions of operation of Muscle Shoals is a "yard-

stick" by which to measure the reasonableness of the electric rate charges. In view of his sponsorship of this legislation the yardstick idea must be taken to be definitely a part of the policy embodied in the Tennessee Valley Authority Act.

(D) The Authority would violate the purposes and policies laid down for its direction if it were to sell its entire output to privately owned utilities, even if such corporations were ready and willing to make such a purchase at a figure favorable to the Authority. The Authority must consider the sale of electricity to non-profit agencies as a preliminary obligation and within reasonable limitations hold its power resources available for purchase by such agencies which can be feasibly and economically served. [fol. 3404] For the Authority's operations to provide a yardstick of public operation by which to measure private operations it is essential that the Authority engage not only in the generation but participate in the transmission and distribution of electricity, since these latter two phases of electric service represent the most important part of the cost of such service. A public yardstick to have value necessarily means public operation from power house to consumer's premises. (It is for this reason that the Authority has adopted a policy of rate and accounting control of municipal distribution operations.)

(E) Contracts with private utilities for sale of current is definitely contemplated by the law, subject only to the policy of giving preference to public agencies. The following are possible alternatives which might serve as the basis for negotiations with private utilities:

(Alternatives)

"1. Sale of entire outpnt of the Authority to the private [fol. 3405] utility, subject to restrictions as to the resale price in accordance with section 12 of the Act.

2. An agreement with the private utilities binding the Authority to confine its power operations within a certain definite territory.

3. The most feasible alternative basis for negotiation consistent with our conclusions as to the law and the yard-

stick policy, which we conceive to be part of the law, would be something along the following line:

The Authority would proceed to enter into contracts with municipalities owning or about to own their distribution systems in the area immediately around Muscle Shoals and in the northeast Mississippi territory. This supplies some public operation and in a measure meets the yardstick policy.

Surplus power not needed in the aforesaid areas should be sold to the private power companies at a remunerative rate to the Authority under a co-operative arrangement whereby the Authority will attempt to secure from Congress funds with which to finance large-scale purchasing [fol. 3406] and distribution of heavy use electrical appliances, notably ranges, refrigerators and hot water heaters. The Authority will seek to be authorized by Congress to provide for the sale of these appliances to any customers directly served by the Authority, or indirectly served by the Authority, that is to say, customers on the distribution system of private utilities which are purchasing the Authority's power at wholesale. This arrangement will furnish an inducement and a consideration to the private power companies for the purchase of our surplus power. In such an arrangement it should be provided that the resale price fixed by any private power company on whose system Authority power is being conducted and utilized should carry a very low rate at the end of the schedule which will encourage and make feasible the use of the heavy appliances, the financing of which is provided for under this co-operative arrangement. It is almost certain that as a condition of any such arrangement the power companies will desire some kind of assurance that the Authority will not serve [fol. 3407] at wholesale the municipalities which do not now own their distribution systems, the point being that the principal fear of the utility is that the distribution systems which they now own will be acquired or that they will be subject to competition in the distribution end of the business. Such an agreement the Authority cannot make for the same reason set out as to an agreement to confine operations to a certain territory. If a municipality being served by a private company in whole or in part with power

supplied at wholesale by the Authority and within the purview of this co-operative arrangement as to appliances determines to acquire its distribution system and applies to the Authority directly for a supply of electricity, the present state of the law, in my judgment, would not permit the Authority to reject such application if in other respects a feasible and economical arrangement were proposed.

4. The Authority could urge that a substantial area now served by private utilities be transferred to public agencies. That is to say, that in the area, for example, in a strip of [fol 3408] perhaps fifty miles in width between Muscle Shoals and Norris Dam, that it be definitely determined that electricity shall be furnished to the consumers through public agencies, principally municipalities. This would be an important accomplishment of the yardstick theory. It would necessitate the Authority going to Congress for a large appropriation with which to assist in the financing of municipalities for the acquisition by them of their distribution systems. Obviously, the power companies would not be interested in this proposal unless they were given assurance that their properties would be purchased and not merely that the Government would finance competing systems which would leave them with their property on their hands. Some measure of protection against unreasonable acquisition prices would have to be provided. In order to take care of the existing generating facilities of private utilities, provision would have to be made either for the Authority to buy a part or all of their output or to buy the facilities themselves.

[fol. 3409] 5. Another possible alternative would be an agreement with the power companies to accept as compensation for the distribution systems in such area the bonds of the respective municipalities. Such a measure, however, has this difficulty, namely, that the municipalities generally are not in position to issue general obligations. If they issue liens against the property a conflict of interests is produced which can be productive of much disharmony and operating difficulties.

6. A further alternative would be for the Authority to cooperate in working out some method of financing these ac-

quisitions through private sources. The difficulty here is that for the Government to work on a co-operative basis with a private investment concern presents some difficult questions of policy and control. It virtually shifts for the time being control of the municipal systems from the governing bodies to a centralized financial organization which, under these circumstances, would exercise considerable power.

[fol. 3410] If none of these alternatives is acceptable to the Board or can form the basis for successful negotiations with companies, the Board is left to its present policy namely, of entertaining applications from any municipality within the areas described in the Authority's announced power policy, of building necessary transmission lines and other facilities to serve such applicants and to gradually build up an area of operations which, over a period of years if successful, will furnish a balanced load and insure the accomplishment of the yardstick objective. This could be, and it is desirable that it should be, combined with an arrangement with the power companies whereby they will continue to purchase as much power as we have available on the most advantageous basis that can be negotiated. At the present time the Authority's operation expenses are being met with some surplus out of the proceeds of the 2 mill contracts with the Alabama Power Company. Continuation of some kind of contract for the purchase and sale [fol. 3411] of power at wholesale to the Alabama Power Company is important to the Authority.

7. In pursuing the present practice of Authority of gradually working toward the building up of a separate system, it is almost inevitable that the availability of the Authority's power at fair rates will produce a market. Part of this market will be the outgrowth of agricultural experimentation projects which will spread to other areas not now served by any central station energy. Part of this growth will be through the establishment, for example, of electro chemical plants along the transmission system. In other words, the building up of a balanced load is not by any means wholly dependent upon our taking away of a market now served by the private companies. That is to say, it is not wholly dependent on the result of municipal elections and acquisitions."

TVA Minutes, October 14, 1933

"The Chairman announced that President Roosevelt had ordered the Tennessee Valley Authority to proceed at once to construct General Joe Wheeler Dam (Dam No. 3), and to use its own funds for this purpose. The President will undertake to have Congress reimburse the Corporation at the next session.

The Chairman requested Authority to increase the engineering force and to employ John L. Savage, Sherman M. Woodward, Charles H. Paul, Charles H. Locher, and such other men as are needed to make preliminary investigations, prepare plans, and to begin construction of the General Joe Wheeler Dam. The Board approved the request."

TVA Minutes, October 24, 1933

"David E. Lilienthal reported the results of his conference with the Commonwealth & Southern Corporation and stated that substantial progress was being made. It was his impression that the utility is tacitly recognizing that the Authority is definitely in the power business and that its purpose in being there is to develop a "yardstick" for measuring power costs.

The Authority's proposal to delimit an elliptical area for its power operations was not favorably received by the utility, Mr. Lilienthal reported, but the utililty has agreed that municipalities which desire to obtain power from the Authority shall not be denied this privilege.

It was suggested that the Authority might start its power operations in a relatively small area and expand as conditions warrants since that power program of the Authority

COMPLAINANTS' EXHIBIT No. 710 (Excluded)

assumes that surplus power will be sold to power companies upon request, subject to recovery should such surplus power be required for the use of municipalities.
[fol. 3414] The suggestion was made that the Authority buy the Tennessee Electric Power Company. The advantages and disadvantages of such a purchase were discussed at length. Mr. Lilienthal pointed out that present excess power capacity should be considered and that existing distribution systems should not be duplicated.

David E. Lilienthal suggested that the Authority attempt to develop a technique for appraising power distribution systems.

Ways and means of acquiring the power company's property were discussed. Arthur E. Morgan suggested that purchase might be made by means of a bond issue. He pointed out the merits of the plan and said it would place the Board in the position of having taken advantage of every possible opportunity to carry out a sound power program.

The results of his conference with manufacturers of electrical appliances were described by David E. Lilienthal who stated that the companies were in complete accord with the policy of the Authority to increase domestic con-
[fol. 3415] sumption of power through greater usage of electrical appliances. He expressed the opinion that the business of selling and installing electrical appliances could be put on a self-liquidating basis and that this aspect probably would meet with the approval of Congress, the Reconstruction Finance Corporation, and the Public Works Administration."

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 552:

TVA Minutes, October 24, 1933

The results of his conference with manufacturers of electrical appliances were described by David E. Lilienthal who stated that the companies were in complete accord with the policy of the Authority to increase domestic con-

The Tennessee Valley Authority is utilizing the nitrate properties at Muscle Shoals and is adding materially to the [fol. 3445] plant in the conduct of experiments seeking processes in the cheaper production and distribution of plant foods. This is very necessary in the rehabilitation of the land and in a permanent program of land ownership and rural development. In the preparation of phosphates, the program may require that part of the manufacturing process should be at the phosphate beds, either within or without the Tennessee Valley. The continuation of this research, together with demonstration of possible economics in actual production, distribution, and use on a commercial scale, is desirable.

Of the total area within the Tennessee River system, which has at one time been in cultivation, perhaps a quarter has been destroyed by soil erosion and that destructive process is now more active than ever. This soil erosion is also filling up and destroying the reservoirs of water-power systems. Unless it is checked, this great region and much greater areas in the Southern uplands will slip backward in material well-being. A program of land use planning has been instituted to determine the best use of the land, and [fol. 3446] the best manner of preventing its further destruction.

The forests of the region have been steadily destroyed by wasteful lumbering, by the common habit of setting fire to the woods each winter, and by the habit of clearing steep hillsides for the four or five corn crops that they will produce before the soil is washed away. The Tennessee Valley Authority has undertaken a program of devising and putting into operation a forest policy appropriate to this region, in cooperation with the United States Forest service and the several states of the Tennessee Valley area, and in harmony with regional planning of the Federal Government.

In the Tennessee Valley area there are many more people engaged in agriculture than are needed in that pursuit. As a part of the program of social and economic planning, studies and demonstrations are being undertaken for readjusting this population, with the encouragement of local industries especially for home consumption and resettlement of families displaced by the establishment of na- [fol. 3447] tional forests, the construction of reservoirs, or

by other causes. Studies are under way of economies and improvements in industrial and community organization, including cooperatives, in the use of natural resources of the region, and of the relation of agriculture to industry, with appropriate experiments and demonstrations. One of the aims is to prevent a recurrence of the congestion of people from those rural areas in our industrial centers.

The transportation system of the region, by rail, highway, water and air, has never been coordinated as to service or rates. A regional study is planned of the transportation rates, facilities, and needs of the Tennessee Valley, in cooperation with other Federal agencies, and the local agencies as a guide to a transportation policy for this region and as an example to other regions.

In cooperation with the educational, health, highway, public safety, and other authorities of the Federal Government, and of the states of the Tennessee Valley area, the Authority has undertaken to promote common understand-
[fol. 3448] ing and common effort to work out solutions to the common problems of the region. These efforts to bring about cooperation should continue.

If these and similar problems of social and economic organization can be successfully solved in this limited region, the methods and results developed will be of great value to the rest of the United States.

Respectfully, Arthur E. Morgan, Chairman of the Board.

There are no such Exhibit numbers.

[fol. 3450] COMPLAINANTS' EXHIBIT No. 770 (Excluded)

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 661:

Synopsis of Letter from Henry T. Hunt, Chairman of Electric Power Board of Review, to Mr. Lilienthal, November 17, 1934, and Letter from Mr. Lilienthal to Mr. Hunt, November 22, 1934

"In reply to this interrogatory, as to correspondence between TVA and the office of Federal Emergency Admin-

sumption of power through greater usage of electrical appliances. He expressed the opinion that the business of selling and installing electrical appliances could be put on a self-liquidating basis and that this aspect probably would meet with the approval of Congress, the Reconstruction Finance Corporation, and the Public Works Administration.

A memorandum dated October 20, 1933, titled, "A proposed cooperative program between the Tennessee Valley Authority and the manufacturers of electrical equipment," was submitted by David E. Lilienthal who said that the proposed program had been presented to the manufacturers of electrical appliances. A true copy of the memorandum, labeled exhibit 10-24-33-a, is attached to these minutes and made a part hereof.

David E. Lilienthal recommended that the Authority proceed with its power plans for the three cities at Muscle [fol. 3417] Shoals and the Northeastern Mississippi area; that negotiations to supply power to towns along the projected transmission line between Wilson Dam and Norris Dam be continued; and that the Authority attempt to develop additional uses for power.

Arthur E. Morgan suggested the electrification of a railway at Asheville, North Carolina, as a possible power outlet for the Authority. He also mentioned as a possibiity for increasing power usage the development of some 400 deposits of manganese ore in the valley region.

The general conclusion of the Board was that conferences with power companies should not be discontinued as long as there is evidence of good faith in the negotiations; that conferences regarding the distribution of electrical appliances to encourage the use of electric power should proceed; that there should be a continuation of effort toward working out an arrangement for delimiting power areas; and that further consideration should be given to the proposal to purchase the Tennessee Electric Power Company's property.

[fol. 3418] It was decided that Mr. Lilienthal should confer with Senator Norris and get his views on the power projects and negotiations pending."

[fol. 3419] COMPLAINANTS' EXHIBIT No. 712 (Excluded)

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 554:

TVA Minutes, November 27, 1933

"David E. Lilienthal reported that he is attempting to work out a comprehensive plan with the cooperation of the Commonwealth & Southern Corporation which will enable the Authority to set up an area for its power operations, and in which its relations with the private utilities will be comparable to the relations which might exist between two privately-owned utilities operating in the same area. He stated that he would like to integrate the existing facilities but not in any way relinquish any of the rights that the Authority is trying to establish in connection with its experimental power project.

He pointed out that through agreements covering the use of rights-of-way and the interchange of facilities, the Authority can cut down its power construction budget tremendously because the program of constructing costly transmission lines can be delayed until the Authority is in a position to see clearly the character of its objectives and determine the quality of the obsticles which confront its efforts.

[fol. 3420] In accordance with Mr. Lilienthal's suggestion, the Board adopted the policy of holding up actual construction of transmission lines, except those being constructed in rural districts by labor provided by the Civil Work Administration until January 1, 1934, so that the results which will accrue from the operation of the program now being prepared can be observed. The planning, drafting, and specification work is to proceed inasmuch as the results of this effort can be used elsewhere.

The Board approved Mr. Lilienthal's work and authorized him to continue his negotiations with the utility as outlined and to report the results of his conferences to the Board.

Mr. Lilienthal stated that he had been convinced since he had conferred with the Electrical Manufacturers Association on the project of making and distributing low cost domestic electrical equipment of good quality, that the policy for the Authority to follow is to contact all manu-

COMPLAINANTS' EXHIBIT No. 712 (Excluded)

facturers of electrical appliances in order to get the benefit [fol. 3421] of competition on prices. One advantage would be that the most aggressive and most imaginative manufacturer would be the one to set the price and quality rather than the dullest and least ambitious of the group."

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 557:

TVA Minutes, March 30, 1934

The minutes of this meeting approved a project entitled "Tennessee Valley Section of the National Plan." This project contained the following provisions:

"Purpose of Project:" To prepare a comprehensive regional plan of the entire Tennessee River basin, as a guide and coordinator of public and private developments now under way or in prospect.

"Personnel Required:" Staff of 30 to be built up during the remainder of February, March and April, together with consultants as needed.

"Appropriation Required: (From 1934-5 budget, submitted February 15, 1934—division of land planning and housing, regional planning section).

Personal services—project R. P. 1	$30,769.50
Other obligations (Supplies, Communications, travel, etc.—Share of $13,500 total shown in budget)	$ 4,000.00
Administrative Expense—(Share in administrative expense of Regional Planning Section and of Land Planning Division)	$ 4,000.00
Total — to June 30, 1934	$38,769.50

[fol. 3425] Time Required for Completion: Remainder of fiscal year, 1934, continuing through 1935 in expanded form, for completion of major portion of plan by June, 1935. Work to go on thereafter as continuation project with reduced staff.

Cooperation: All Divisions. This is essentially a project for the coordination of all TVA and outside activities affecting land development. It will depend, for factual material and recommendations, on all Divisions engaged in development work, as well as on Federal, State and local agencies.

Need of Project: The Tennessee Valley is not waiting for a plan—its development is constantly going on and the

pace is daily quickening. During the next few years miles of new pavement will be laid that will later be abandoned, expensive bridges, schools and homes will be built below the level of future lakes, settlers will start farms on land that shortly will be incorporated in public parks and forests, transmission lines will be built to serve areas that will be [fol. 3426] depopulated, mistakes by the hundred will be made, costly mistakes and damaging mistakes,—unless there is a comprehensive plan against which individual developments can be checked in advance.

The Authority is embarking on a hydro-electric program which will completely change the physical structure of large sections of the Valley, and will affect every part of it. Extensive rearrangement of the highway system and of railroad lines will be required. Other parts of the program, coupled with the operations of other Federal agencies will alter established modes of living, change farming methods and industrial operations, make substantial changes in the ownership and use of lands, and cause major shifts in population.

The result of all these forces acting in the Valley will be utter confusion unless there is prepared a master plan through which they may all be coordinated and directed toward a common objective. The entire program of the Authority will be brought to naught and the huge public and private investments in the Valley jeopardized if the estab- [fol. 3427] lishment of such a plan is too long delayed. Its preparation is a long and careful process, it cannot be completed overnight. It will require extensive study, wide collaboration, and much reshaping and adjustment after it is put in preliminary form. An early beginning is therefore imperative.

It is to develop the skeleton of such a plan that this Project is set up. Every part of the Valley program, whether it is physical or social or economic or political, public or private, relates in some way to the arrangement and use of land, and through its relation to the land is brought into relationship with every other part. Land planning is the coordinator between the physical construction of dams and roads, the economic effect of cheap power and fertilizer, and the social composition of the region. Through the planning of the physical development of the Valley, the other essen-

tial elements of planning are brought together and given comparable expression.

A comprehensive plan presented graphically will bring [fol. 3428] out instantly any conflicts that may exist between highway and reservoir proposals and lead to their correction before expensive construction is undertaken. It will show the relationship of proposed centers of agricultural or industrial production to their urban markets, the avenues for transportation of their products, their place in the power transmission system. Map presentation will show at a glance the bearing on county consolidations of physical barriers, routes of communication and population centers. It will show the relative amounts of land and relative position of areas classed as crop or grazing land, forests or submarginal areas, and relate them to centers of population, mineral resources, transportation and all the other elements of the Valley life. Map presentation of physical conditions and proposals frequently discloses economic opportunities arising from the juxtaposition of factors whose relationship would otherwise be missed.

As a protection to the Authority itself against costly [fol. 3429] mistakes; as an aid to intelligent coordinated planning of the Valley life; and as a guide for those myriad private and public developments in progress throughout the Valley at all times, a master plan of the whole Valley area is urgently needed, and the Division of Land Planning and Housing, herewith requests Authority to commence its preparation.

The type of personnel required for this work will not be readily found, and it will probably be some time before an adequate and qualified staff can be selected and brought together. For this reason at least preliminary aut' orization will be required several weeks before the project itself can be inaugurated. The emphasis of all branches of the President's program on planning has already brought into Government service the majority of those proficient in the planning field. There are few, if any, of those qualified for a responsible part in the preparation of a Valley plan who are in need of employment. The result is that this Division will have to offer salaries in excess of those received in other professions where the number of men available is greater or the current demand less, and it will have to offer an

COMPLAINANTS' EXHIBIT No. 715 (Excluded)

[fol. 3430] opportunity for constructive service and a degree of permanency at least as great or greater than is now offered in other planning activities of the Government. It is believed that the salary schedules set up in the budget for this project are sufficient to attract the type of men required if reasonable permanency can be assured."

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 563:

TVA Minutes, April 13, 1934

At the meeting of the Board of Directors of Tennessee Valley Authority held on April 13, 1934, there was approved a project designated "Tennessee Valley Authority project authorization request," to the following effect:

"From Llewellyn Evans, Chief Engineer, dated March 27, 1934, Project Title, Acquisition of power Distribution Facilities to serve the City of Athens and Limestone County, Alabama. Purpose, purchase of properties from Alabama Power Company to serve Athens, Alabama, and Limestone County, covered in contract negotiated with the above company January 4, 1934. Procedure, Legal Department to Examine Title of all Property involved as described on page 3 of this request, and Treasury Department be authorized to make payment for property transferred thus acquiring title in the name of the Tennessee Valley Authority after engineering division has made suitable inventory. Estimated cost, $177,396.52. Recommendations, briefly this project consists of completing a portion of the contract entered into [fol. 3432] January 4, 1934, between the Tennessee Valley Authority and the Commonwealth & Southern Corporation to purchase properties owned and operated by the Alabama Power Company in Limestone County, Alabama. The properties to be taken over as described in exhibit B of the Commonwealth & Southern contract as follows:

Page 2 of exhibit B: Approximately 14½ miles of 44,000 volt transmission line from Athens to Belle Mina.

Sheet 4 of exhibit B: Belle Mina central substation, consisting of three 150 kva transformers with one outgoing

COMPLAINANTS' EXHIBIT No. 716 (Excluded)

unregulated circuit and the Athens district substation consisting of four 1,000 kva transformers 44,000 to 11,000 volts supplying three outgoing unregulated circuits.

Sheet 5 of exhibit B: Item 10, which lists all of the rural lines in Limestone County.

Sheet 6 of exhibit B: Items 8 and 10, describing the Belle Mina distribution and the Athens distribution.

[fol. 3433] It might be well at this point to discuss properties, described on sheet 6 of exhibit B, since this property is not included in the $1,000,000 mentioned in paragraph 2 of the Commonwealth & Southern contract. Without item No. 10, exhibit B, sheet 6, will be unable to serve the city of Athens and by acquiring the property listed in this item as well as item 8, we will acquire all power facilities in Limestone County. The City of Athens being a municipally owned distribution system, will be able to supply all of the service required within the corporate limits. The Tennessee Valley Authority can organize the remaining rural territory consisting of Belle Mina, Capshaw, Tanner, Ardmore and Elkmont in a rural power district administered by the present personnel of the Alabama Power Company at Athens, or personnel that we may see fit to substitute in place of them and thus operate this rural section until such time as a reasonable rural cooperative organization may be formed to take over the operation of this territory.

There might be some hitch in the acquisition of the properties listed on sheet 6 of exhibit B, due to the fact that this [fol. 3434] property is not included in paragraph 2 of the contract, but we are sure the power company would prefer to accept our money for a definite sale rather than risk the chance of these facilities being duplicated by the communities themselves."

[fol. 3435] COMPLAINANTS' EXHIBIT No. 717 (Excluded)

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 564:

TVA Minutes, June 30, 1934

David E. Lilienthal described to the Board the status of negotiations with the Alabama Power Company and sub-

mitted recommendations concerning the acquisition of electric distribution properties in Northern Alabama. The Board unanimously adopted his recommmendations which are contained in exhibit 6-3-34-b, a true copy of which is attached to these minutes and made a part hereof.

The recommendations referred to were as follows:

"To: The Board of Directors.
From: David E. Lilienthal.
Date: June 30, 1934.
Subject: Recommendations to the Board for acquiring distribution properties in Northern Alabama.

"It is proposed that the Authority shall immediately acquire from the Alabama Power Company distribution properties in Northern Alabama to be operated under the following plan.

1. Properties shall be purchased for the lump sum of $1,000,000.00, and retained by TVA for an interim period of direct operation during which additional rural lines will be [fol. 3436] constructed and the urban properties rehabilitated and improved. The rates to be charged shall be the basic TVA rates plus a surcharge of 10 per cent to be applied to all classes of customers. This surcharge is required in order that the capital investment may be returned to the TVA within 10 years. If no surcharges were imposed, it would require from 15 to 25 years to retire the investment.

2. At the expiration of the interim period, which may be from six months to several years as the Authority may determine, the properties will be reconveyed to local municipalities, county associations, or other local organizations, upon terms and conditions outlined in the attached "Plan for Distribution of TVA Electricity in North Alabama."

3. During the period of operation, the accounts will be carefully kept and all profits from operations and income from surcharges will be applied toward the reduction in purchase price offered to the local organizations.

4. It is understood that the plan will not be operative [fol. 3437] unless and until definite and satisfactory commitments have been made by local organizations expressing

COMPLAINANTS' EXHIBIT No. 717 (Excluded)

their willingness to assume responsibility and control of local distribution systems at a later date.

5. The proposed plan will permit the Authority to increase its power market almost immediately. It will prevent duplication of existing systems by municipalities now contemplating construction with PWA funds. It will make possible the throwing together of rural and urban electric systems and the development of economic load areas.

6. Figures on evaluation and earning power justifying the option price of $1,000,000 which TVA has obtained from the Commonwealth and Southern are given in a memorandum entitled "Program for Acquisition of Distribution Properties in Northern Alabama."

TVA Minutes, August 7, 1934

"The Board considered the proposed budget covering the Authority's operations for the fiscal year ending June 30, 1935, copies of which the Board members had previously studied individually. After spending two days analyzing, discussing and revising the various items in the proposed

COMPLAINANTS' EXHIBIT No. 719 (Excluded)

project, the Board unanimously adopted the following Resolution:

The budget referred to above contained under caption 'Electricity Program for the Fiscal Year Ending June 30, 1935,' an item of $100,000 entitled 'Sales Promotion—EHFA'; also, 'Sales Promotion-Chattanooga Merchants Display'; also 'Sales Promotion Electric Kitchen.' This budget also included the following items: For the fiscal year stated $270,490 for engineering and general data and land acquisition (dam) for Hiwassee Dam and included certain supporting statements; set out on pages 4 and 5 thereof. The budget also included similar items for the French Broad Dam and included design studies 'which will ultimately lead [fol. 3440] to the final project plans and working drawings from which dams, power houses and other structures will be built.' Also like items for Aurora Dam with like supporting statements.

Report of Arthur E. Morgan to the President on the Activities of the Tennessee Valley Authority

"The President, The White House, Washington, D. C.

MY DEAR MR. PRESIDENT:

"The Tennessee Valley Authority has been operating for approximately ten months. In that period rapid progress

has been made in the construction of Norris Dam as well as in the other features of the program. The Authority has taken over the operation of the Muscle Shoals power plant, and by construction and purchase is acquiring a distribution system which should absorb all of the electric power now available at the plant. Arrangements are now being made for the sale of this power, including the development of rural electrification. A corporation known as the "Electric Home and Farm Authority" has been organized [fol. 3443] to stimulate the use of electric appliances and the consumption of electric power.

Last October you asked the Authority to start construction on Joe Wheeler Dam as a means of providing additional employment. Work was begun immediately. In view of the rapid development of the power program, the need for this additional power may materialize sooner than was expected.

In the past our water resources developments have merely been in separate, uncoordinated units. The development and utilization of the water resources of the Tennessee River system in accordance with a single unified plan by a single public Authority, as contemplated in the Tennessee Valley Authority Act of 1933, makes possible great increase in use and very great economics of expenditure. I therefore am pleased to report the beginning of such development and control of the Tennessee River and its tributaries for navigation, flood control, power development, and other uses, except for the operation of navigation facilities, under [fol. 3444] the administration of the Tennessee Valley Authority, and the unified development of that river system by this Government agency as a national policy. Provision should be made at present for continuing the construction of the Joe Wheeler Dam, and for beginning work on about four other dams on the Tennessee River or its branches.

The power program of the Authority, in promoting the wider and better use of electricity for the Tennessee Valley and for the nation, its program of encouraging rural electrification, and the design and distribution of low-cost electrical appliances, is a stimulus to the manufacturer of appliances, to both publicly owned and privately owned utilities, and the larger and better use of electric power by the whole people. That program should be continued and extended.

istration of Public Works, relating to loans to municipalities in Alabama for the purpose of constructing electric utility systems, TVA se-t out a letter dated November 17, 1934, from Henry T. Hunt, Chairman of Electric Power Board of Review (Federal Emergency Administration of Public Works) to the defendant David E. Lilienthal, Director and General Counsel of TVA, asking to be advised as to the developments in the matter of TVA's option to purchase Alabama Power Company's properties, and requesting a list of the towns, and to be advised "how this and other recent developments will affect the attitude of TVA towards applications now before PWA for electric projects in the area."

The following was the reply of TVA, by David E. [fol. 3451] Lilienthal:

Knoxville, Tennessee,
November 22, 1934.

Hon. Henry T. Hunt, Chairman, Electric Power Board of Review, Federal Emergency Administration of Public Works, Washington, D. C.

DEAR MR. HUNT:

I have your letter of November 17, regarding the 14 north Alabama towns. A list of the towns follows:

Courtland	Red Bay
Decatur	Sheffield
Falkville	Town Creek
Florence	Tuscumbia
Hartselle	Cherokee
Leighton	Russellville
Moulton	Rogersville

As to the TVA's attitude toward applications now before PWA for electric projects in this area: If the transfer of these properties by purchase can be effected in the reasonably near future, then it is the expressed position of these [fol. 3452] communities, as our records indicate, that PWA loans will not be utilized to carry out the mandate of their electorate for the acquisition of a distribution system. If, however, the purchase transaction is blocked and indefinitely delayed by tactics which has been heretofore em-

COMPLAINANTS' EXHIBIT No. 770 (Excluded)

ployed, then it may well be that the communities will not desire to wait indefinitely but will take the position that they desire to construct their own distribution systems.

We will advise you promptly as to developments in this proceeding. The Alabama Commission has taken under advisement the matter of approving the sale by Alabama Power Company to TVA. The other day Judge Grubb of the Federal Court denied a temporary injunction against the transfer petitioned for by certain stockholders of the Alabama Power Company. I will keep you advised of developments.

Very truly yours, Tennessee Valley Authority by David E. Lilienthal, Director and General Counsel.

Telegrams, David E. Lilienthal to Mayor W. L. Farr, June 20, 1934

"Dated Knoxville, Tennessee, June 20, 1934.

MAYOR W. L. FARR, Tuscumbia, Alabama:

"Replying your wire in which you inquire if TVA will negotiate purchase existing distribution system or whether

COMPLAINANTS' EXHIBIT No. 772 (Excluded)

City should proceed with application for loan from PWA. For several months TVA actively considering purchase existing distribution systems in Northern Alabama such cities later to repurchase from TVA systems including rural without issuance of bonds and solely out of electric revenues. This program was intended to eliminate delays and uncertainties involved in PWA situation and obviate duplication of distribution systems and expensive competition. Negotiations with Alabama Power Company for option on distribution facilities throughout Northern Alabama by TVA thus far unsuccessful because we find price fixed by company in excess reasonable value of property [fol. 3455] considering depreciation. Due to this failure of negotiations undersigned conferred June thirteenth with Administrator Ickes and General Counsel Hunt of PWA. Expect further work from PWA June twenty first. Regard inability to buy existing facilities most unfortunate but see no alternative for cities but to press PWA applications. Unless pressure occasioned by passage additional appropriation prevents desire to spend several days conferring with you and other responsible parties in Northern Alabama early as possible. Your fine assurance of cooperation in advancement of entire Valley deeply appreciated.

David E. Lilienthal."

Budgetary Statement—"Estimate of Appropriations, Fiscal Year Ending June 30, 1936) and the Justification, Relating to the Electricity Program

13. In answer to this interrogatory, requesting TVA to attach a copy of its operating budget, its budget for capital expenditures, a statement of its operating revenues and expenses, and as to the — amounts set aside for construction of generating plants, transmission lines and distribution systems, the TVA set out in its answers a report entitled "Estimate of appropriations fiscal year ending June 30, 1936 (revised November, 1934)."

This document is set out in full in the Appendix.

The document is prefaced by a statement entitled "Justification, Tennessee Valley Authority Budgetary Request," stating that the general purposes of the Tennessee Valley Authority are as follows:

1. Unified development and control of the water resources of the Tennessee River and its tributaries through the construction of dams to provide navigation control floods, and produce power.

[fol. 3458] 2. Utilization of the power resources as a yardstick in determining the relative costs of public and private power operation, and distribution of this power to the greatest number of people.

3. Experimentation to lower the cost of production, distribution and application of the major elements of plant food.

4. National planning for a complete river watershed, including erosion control, afforestation, the further use of mineral resources, the promotion and coordination of industry and agriculture, surveys and plans for the proper use of land, and the general social and economic well-being of the Valley.

This "justification" thereupon proceeded to describe the progress of the work under construction on Norris and Wheeler Dams, and included the following statements:

"A power policy has been formulated. Wholesale and retail rates have been fixed. The nucleus of a TVA power system has been established through the purchase of transmission and distribution facilities. One hundred miles of [fol. 3459] rural lines have been constructed. Arrangements have been made to serve more than 50 municipalities and private power companies have been stimulated to substantial rate reductions. Low cost electric appliances have been made available through regular retail dealers by the Electric Home and Farm Authority in cooperation with manufacturers. In Tupelo, the first city to use Muscle Shoals power, low rates and low cost appliances have increased the use of electricity one hundred per cent over last year. Similar increase is in evidence elsewhere.

"The budget request for 1936 provides for the continuation of the above program. Norris and Wheeler Dams will be completed. Two additional dams are proposed as navigation and flood control projects, and as a means of providing additional employment. Electrical properties acquired or constructed in 1935 will be operated and will provide additional revenues. Further steps will be taken to round out the electrical system and to increase the use of electricity."

The budgetary request or estimate contained a summary of all its programs, divided into Water Control, Electricity, [fol. 3460] Fertilizer, Regional Development, Administrative in General, Service Activities, aggregating for 1936 $57,169,954; for 1935, $67,550,023; and for 1934, $12,365,175.

Under Water Control were listed Norris, Wheeler and Pickwick Landing Dams, and an undesignated "tributary dam or dams" and "main river dam."

COMPLAINANTS' EXHIBIT No. 774 (Excluded)

The Electricity program for 1936 is subdivided into Planning and Development, Administrative and Equipment, Engineering and Design, operation of power plants ($608,000), Mississippi Division operation, Alabama Division operation, Tennessee Division operation, and construction and/or acquisition ($13,211,400). This summary indicated revenues for 1936 from the operation of the electricity program of $4,600,000. The summary set out the expected cost of operating the respective steam and hydro plants, and indicated the revenue to be expected from wholesale sales, indicated $770,000 of revenue expected from the Mississippi Division, $800,000 from the Alabama Division, and $2,630,000 from the Tennessee Division.

[fol. 3461] Under the sub-division Construction and/or acquisition under the Electricity Program, the estimate indicated that * * * items of classifications of expenditure, including transmission lines, substations, power plants and facilities to serve tributary dam, service connections with industries, increasing the generator capacity at Wilson Dam, high tension circuit and equipment, transformers, new rural lines in Mississippi, service extensions and connections, voltage regulators, rural lines in Alabama and Tennessee, the purchase of properties of Tennessee Public Service Company, of Tennessee Electric Power Company, Alabama Power Company, new service extensions and connections, communication circuits, interconnection circuits, the construction of a 110 kv. line from Wilson Dam to Tupelo, industrial lines and extensions in Alabama and Tennessee, miscellaneous high tension lines and substations ($4,250,000), and concluded with the following items:

"Purchase of Additional Transmission System, $5,017,000."

[fol. 3462] Under the estimate for the Fertilizer Program were included $1,940,000 for the operation of an electric fertilizer plant, construction of additional furnaces, etc., aggregating $4,010,000 for 1936; and indicated expected revenues from fertilizer operations of $1,340,000.

Under the item Administrative Equipment is included, among others, "Sales Promotion, $100,888 (1935)."

COMPLAINANTS' EXHIBIT No. 774 (Excluded)

Under the heading Regional Development Program were included $1,500,000. Under the caption "Industry, $805,000; under agriculture, $300,000; under Social and Economics, — and $2,200,000 under Norris area development, etc. This $1,500,000 of industrial development included for the year 1936, $700,000 for research, $180,000 for surveys and promotion of industries, $50,000 for industries and power market studies, etc.

The estimate contained the break-down under the respective headings Engineering, Planning and Geology, For-
[fol. 3463] estry, Social and Economic, and Land Planning, including among others, $100,000 for research in social studies, and archaeological survey, planning mountain regions, etc. The summary also included $40,000 of indicated expenditure under the heading "Materials and services to EHFA and others."

[fol. 3464] COMPLAINANTS' EXHIBIT No. 775 (Excluded).

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 669:

TVA Answers Respecting Its Corporate Functions.

28. In answer to interrogatories as to its corporate functions, TVA set out its departmental organization. The Electric Department indicated a steam power generation division, hydraulic power generation, internal combustion generation, transmission, distribution (city and rural), utilization, commercial, new business, and general office. The statement set out the production expense by plants, breaking them down into hydro-electric plants, steam plants, and internal combustion plants.

Among the activities scheduled under the Industrial Division were shown to be 44 employees, and were included the following captions:

"Number of Representatives of Industrial Companies canvassed with a view to locating plants in the Tennessee Valley."

COMPLAINANTS' EXHIBIT No. 775 (Excluded).

"Number of Companies which have established branches in the South or moved to the Tennessee Valley as a result [fol. 3465] of representations made by TVA Industrial Division employees."

In the analysis of the production cost of electric plants, division is made between production for commercial use and non-commercial use, and the figures are set out for the operation of the steam stand-by plant at Tupelo, Mississippi, having a plant generating capacity of 3,500 kw.

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 683:

Stipulation as to Testimony of Harold L. Ickes.

"The parties to the above styled cause, acting by and through their respective solicitors of record, do hereby stipulate and agree that if his testimony had been taken in this case, Harold L. Ickes would have testified in substance as follows:

"That the telegram from him to Mayor Lee Glenn, Florence, Alabama, dated July 11, 1934, was sent after a conference with David E. Lilienthal.

"That prior to November 1, 1933, David E. Lilienthal conferred with the Administrator of Public Works, and that the Administrator expressed his willingness to consider in a co-operative manner applications for loans in the Tennessee Valley Area for municipal electric systems where towns had entered into contracts for power with Tennessee Valley Authority.

"That from time to time after January 4, 1934, consideration and action on applications for loans from Alabama towns in the area covered by that contract were affected by advice from the Tennessee Valley Authority as to the existing status of negotiations for the purchase of such [fol. 3467] properties. Within the last few weeks, at about the time of the letter of David E. Lilienthal to the Alabama

COMPLAINANTS' EXHIBIT No. 776 (Excluded).

Municipalities, consideration and action upon such application was expedited.

"That counsel for Tennessee Valley Authority appeared as amici curiae with counsel for the Public Works Administration in filing the brief in the Supreme Court of Alabama in the case of Oppenheim versus City of Florence in support of the validity of the proposed revenue bonds proposed to be issued by the City of Florence to PWA for the proposed PWA loan and grant to that town.

"That the reference in the Chattanooga Times of November 19, 1934, quoting Mr. Ickes as stating that the power companies have instituted suit and are using the money of the companies to go into Court with dummy lawsuits in an effort to stop the inevitable" is a correct quotation.

"That the Administrator of Public Works regards that part of the Tennessee Valley Authority program relating [fol. 3468] to the generation, transmission and sale of power as constituting a part of the general policy and program of the national administration."

Supplementing the stipulations as to the testimony of Harold L. Ickes, it was agreed that counsel for Plaintiffs might read in evidence the following letter addressed to him from Henry T. Hunt, Chairman of the Electric Power Board of Review:

"As to the action taken on a protest filed by Mr. A. C. Garber, Chairman, Alabama Power Company's Preferred Stockholders Protective Committee, I read the protest as chairman of the Electric Power Board of Review and concluded that all matters on which the protest was based had been considered by the Board. Accordingly, the protest was filed."

[fol. 3469] COMPLAINANTS' EXHIBIT No. 777 (Excluded).

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 686:

PWA Electric Power Board of Review Opinion re Decatur, Alabama.

Introduced in evidence as representative of the method of handling the Public Works Administration loans to the

municipalities, and of the attitude of PWA with reference to such loans, were various proceedings relating to the loan of the City of Decatur, as follows:

"Whereas, the Electric Power Board of Review and the Deputy Administrator recommended that the project of the City of Decatur, Alabama, for the construction of an electrical distribution system, including the low side of the substation and equipment, to be included in the comprehensive program of Public Works for the reason, among others, that the Tennessee Valley Authority has acquired the necessary transmission lines to serve said distribution system and the financing of said project will aid said Authority in obtaining a market for its electrical energy:

"Resolved that said project be included in the comprehensive program and that the sum of $350,000 (of which not [fol. 3470] to exceed $100,000 shall be a grant) be allotted to finance the accomplishments thereof, subject to the execution of a contract satisfactory to the Administrator and in accord with the recommendations of the "Electric Power Board of Review" dated June 22, 1934, as amended by its report of July 30, 1934."

The recommendations of the Electric Power Board of Review, referred to in the above resolution, introduced as Plaintiff's Exhibit 28-A, was as follows:

"Subject: Application for loan and grant of the City of Decatur, Alabama, (Docket No. 6587) for the purpose of constructing distributing system, including low side of the substation and equipment, in the sum of $371,743.

After review of the Docket, this Board finds:

"1. The engineering division by its supplemental report made the following conclusion and recommendation:

'It is our opinion that the proposed project is a public necessity and of social desirability; that it will afford needed employment, and that on the above assumptions it is technically and economically sound.'

[fol. 3471] "The assumptions referred to are that.

(a) 'The municipal plant will receive, in addition to all the municipal load, 60 per cent of all other business in the

first year of operation, and 80 per cent at the end of the loan interval.'

"This assumption, in the opinion of this Board, is far below that portion of the total business the municipality will receive, inasmuch as it will offer rates at least 60 per cent less than the present rates being charged by the Alabama Power Company by reason of the contract offered the City by the TVA; and as the Alabama Power Company, the competitor, cannot reduce its rates by anything like 60 per cent of its present rates by reason of its service to the City of Birmingham, and as it would be under the necessity of reducing its rates to other cities served by it in Alabama. If rates required by the TVA, contract are charged and the city obtains the same business the company now has, its income will provide for maintenance and operating costs, interest, amortization, and taxes, and a net income [fol. 3472] over all $10,525. This appears by the estimate of O. M. Rau attached. This estimate makes no allowance for what may reasonably be expected in the way of increase of current sold and of income by reason of the heavy reduction of rates. That a reduction of rates produces larger net incomes is shown, among other examples, by the experience of the City of Washington, under its contract with the Potomac Electric Company covering the years 1925 to 1934. Under this contract the Company is required to apply one half its surplus to rate reduction. The maximum rate in 1924 was 10 cents per kwh. Rates are now, after successive reductions, 3.9 cents for the first 50 kwh., 3.3 cents for the next 50, 2 cents for the next 100 and 1.5 cents for all over 200. In 1924 the Company earned 3.4 times its bond interest after allowing for depreciation and taxes. In 1932 with rates cut to one-third it earned its interest twelve times. Earnings per share increased from $26.90 in 1924 to [fol. 3473] $68.08 in 1932. The privately owned electric company in Hartford, Connecticut, has had a like experience. Hence this Board finds that the assumption of the Engineering Division on which it bases its conclusion that the project is technically and economically sound is far less favorable to the City than the facts warrant.

The same finding applies to the estimate of Mr. O. M. Rau. This Board is of opinion that during the first year after the City begins business it will have at least 75 per

cent of the business measured in dollars, and an increase of not less than 10 per cent in each succeeding year. Accordingly it finds that the project is technically, economically and financially sound.

The said finding of financial soundness is supported by the report of the Finance Division dated April 12, 1934. This report was based upon a report of the Engineering Division dated March 6, 1934, a prior report to that referred to above and one less favorable to the City. The [fol. 3474] Finance Division report of April 12, found that on the basis of the division of business estimated by the engineer-examiner, '50 per cent of sales the first year and 75 per cent the 20th year and all municipal business' the project will earn only about 1.05 times the debt service for the first several years with a deficit for the first year. Inasmuch as the estimate of the engineer-examiner referred to has now been modified so that the estimates of division of business is altered to all the municipal load and 60 per cent instead of 50 per cent the first year, with an increase of 2 per cent each year, it is obvious that the Finance Division would approve the loan on the revised basis. Furthermore, this Board is of opinion as stated above, that even the revised estimate upward of the engineer-examiner is too low in view of the heavy reduction of rates proposed. As stated above this Board is of opinion that the said reduction will increase the portion of business obtained by the City and also the net revenue.

[fol. 3475] 2. This Board has further reviewed the conditions attached to the report of the Engineering Division dated March 6th 1934, as follows:

'3-a The applicant shall furnish evidence satisfactory to the Administrator that the Alabama Power Company can be legally required to furnish service on a day to day basis until the acquisition by the municipality of the used and useable portions of the existing distribution system.'

This condition having been reviewed by this Board is disapproved as impossible of performance; and the following condition substituted:

"The applicant shall furnish evidence satisfactory to the Administrator that the Alabama Power Company can be legally required to furnish service on a day to day basis until the municipal system is ready for service.

COMPLAINANTS' EXHIBIT No. 777 (Excluded).

This Board has reviewed the further condition:

'3b. And that thereafter' (the acquisition of the competitive system) 'the power company will be without au-
[fol. 3476] thority to sell power within the municipal limits.'

This condition is also disapproved by the reason that it prevents any loan being made as such a showing involves a lawsuit and is probably impossible of performance as the company has a franchise until October 1, 1949. If the TVA fails to purchase the distribution system of the company and the municipal system being under the necessity by its contract with TVA of offering rates at least 60 per cent less than existing rates, the company, being unable to provide an equally low rate will be unable to continue to compete and must withdraw. Hence this condition should be stricken out.

This Board has further reviewed conditions 4a of the engineer-examiner:

'(a) That no depreciation charges, taxes or any other items of expense, except normal operating expenses and power and lighting extensions shall be charged against the revenues of this project.'

It approves this condition.

[fol. 3477] It has also reviewed condition 4b:

'That all municipally used electric energy shall be paid for at current selling rate schedules annually during the interval of the loan from the general fund into the account of this project.'

This Board also approves this condition.

This Board finds also that the Engineering Division omitted to recommend a grant. Its report does not show any reason for this omission.

This Board finds that the applicant is as much entitled to a grant as other applicants to which grants have been allowed.

Resolved, that this Board recommends an allotment to the applicant in the sum of $372,000, of which not to exceed thirty per cent of the cost of the labor and materials employed thereon, estimated at $100,000, shall be a grant.

(Signed) Henry T. Hunt, Chairman."

Excerpt from "Exhibit K" to Defendants' Answer (Transcript of Record in the case of TVA, et al., v. Ashwander, et al.) page 691:

Reestablishment of Electric Power Board of Review in PWA

"Effective May 9, 1934, the 'Electric Power Board of Review' is established, membership, Henry T. Hunt, Norris L. Cooke, and Otto M. Rau.

It will be the duty of this Board to review disapprovals, and special conditions imposed, by any division of PWA and to make recommendations to the Deputy Administrator with regard to applications of public bodies to finance the construction, repair, improvement or extension of electric power plant facilities.

The Technical Board of Review is instructed to refer to said Board, Henry T. Hunt, Chairman, room 5139, all such projects now pending before it on which it has not given notice of hearing.

The Projects Division is instructed to refer to Mr. Hunt summary report folders for such applications as have heretofore been and may hereafter be disapproved by any [fol. 3479] division or approved with any special conditions appearing on any divisional report.

The Electric Power Board of Review is directed to formulate and submit to the Administrator instructions for the guidance of the several divisions with regard to competitive situations and other controversial questions affecting this class of projects.

(Signed) Harold L. Ickes, Administrator."

TVA Press Release of August 22, 1933

The Tennessee Valley Authority will oppose application by Southern Industries and Utilities, Inc., for permission to construct the Aurora Dam and power plant on the lower Tennessee river. This was announced today by Director David E. Lilienthal, in charge of the power phases of the Tennessee Valley program.

COMPLAINANTS' EXHIBIT No. 779 (Excluded)

W. E. Waldo, president of the utility company which has been working on the site under a preliminary permit, has requested the Federal Power Commission for a 50-year permit to enable his firm to go ahead with its development. Counsel for the Authority will argue against the granting.

This is the first test of the Authority's opposition to further exploitation of the Valley's waterpower and other resources until a definite conservation policy is worked out. The Authority is of the opinion that Congress intended that the former, being charged with the public's interests, should have exclusive jurisdiction in all future developments on the Tennessee River and its tributaries.

[fol. 3481] COMPLAINANTS' EXHIBIT No. 780 (Excluded)

TVA Press Release of July 24, 1933

The Tennessee Valley Authority has sent its consulting electrical engineer, Mr. Llewellyn Evans, into the Muscle Shoals area for the two-fold purpose of investigating the power field and checking up the readiness of the Wilson Dam for commercial light and power service. In the former connection, Mr. Evans will inquire into the proposed tie transmission line between Muscle Shoals and the Cove Creek project. If this line is deemed feasible, the Authority would like to begin its construction this fall.

Mr. Evans, who is a national authority on power rates, intends to make contact with enough prospective users of electricity to get an intimate picture of what they want and expect with the idea of supplying their needs.

The Authority has received tentative power applications from about 25 municipalities in Alabama, Kentucky, Mississippi and Tennessee, and inquiries involving others. Some of these places have municipal plants; others are served by private lines, and several have no electric service whatever.

[fol. 3482] There are two avenues open for the Authority to afford power service. The first is to bargain with existing private lines for service on a rate schedule to be established. The second is to build its own lines, serving groups of municipalities in the order of their application in so far as possible.

[fol. 3483] COMPLAINANTS' EXHIBIT No. 781 (Excluded)

TVA Press Release of July 31, 1933

The directors of the Tennessee Valley Authority have ordered the immediate preparation of preliminary plans for the tie transmission line between Wilson Dam at Muscle Shoals and the proposed dam at Cove Creek. The distance between these points is approximately 220 miles. Preparation of the plans will be under the direction of Mr. Llewellyn Evans, consulting electrical engineer, who is now at Muscle Shoals.

The directors have also authorized immediate action to provide power for Florence, Sheffield and Tuscumbia, Alabama. These municipalities are in the immediate vicinity of the power plant at Muscle Shoals. Negotiations with these places will be undertaken at once by Mr. Evans.

The directors' action on the transmission line and furnishing power to the three Alabama municipalities followed the report of Mr. David E. Lilienthal, member of the Board, who inspected the Government power facilities at Muscle Shoals before attending the meeting of the directors at Knoxville, Tennessee, where application for service was received from officials of that city.

The directors announce that the Authority will take over the services of approximately 200 men now employed by the War Department in the Cove Creek area.

[fol. 3484] COMPLAINANTS' EXHIBIT No. 782 (Excluded)

TVA Press Release of August 1, 1933

In recognition of his long and successful fight for Government control of the power resources of the Tennessee river system, the board of directors of the Tennessee Valley Authority announces that the proposed dam at Cove Creek will be named in honor of Senator George W. Norris of Nebraska. Thus, "the great Nebraskan and the New Deal will be remembered together in the historic Norris Dam in eastern Tennessee upon which work will shortly begin," declares Chairman Arthur E. Morgan.

Norris Dam will hold a commanding position in regulating the flow of the Tennessee river, and in providing the valley with the power needed to develop the new and enduring

COMPLAINANTS' EXHIBIT No. 782 (Excluded)

prosperity which President Roosevelt hopes to bring it through the agency of the Tennessee Valley Authority. The building of this dam and reservoir is the first major construction project in the huge undertaking. * * *

[fol. 3485] COMPLAINANTS' EXHIBIT No. 783 (Excluded)

TVA Press Release of August 10, 1933

In furthering its organization and looking toward executing preliminary projects with the least possible delay, the Board of Directors of the Tennessee Valley Authority has allocated specific duties to its three members as follows:

Arthur E. Morgan, chairman of the board, is delegated to supervise all matters concerned with the Norris Dam and reservoir and town at Cove Creek; land and regional planning, including subsistence homesteads (except agriculture), and housing; educational and training program, other than agriculture; engineering, including studies, plans and constructions for the control and use of water and mineral resources (except Muscle Shoals dam and power house and electrical transmission and distribution) and matters concerning raw material for fertilizer; social and economic organization and planning; forestry, soil erosion and conservation methods (tentatively), and will share with Dr. Harcourt A. Morgan matters relating to industry, especially relating to training for industry and its association with cooperatives, besides administration of general functions and coordination of a unified program.

[fol. 3486] All matters relating to agriculture are placed in charge of Dr. Harcourt A. Morgan. This includes rural life planning and matters relating to localized industry and its relation to agriculture. I addition, Dr. Harcourt A. Morgan will direct the design, construction and operation of smelters for phosphorous and for potash; a research program in the nature and behavior of fertilizers; the purchase, blending and sale of fertilizers; a chemical engineering department, and the program of research and development in the manufacture of fertilizers, cement and dry ice; maintenance and operation of Nitrate Plant No. 2 at Muscle Shoals; plans for a cement plant.

COMPLAINANTS' EXHIBIT No. 783 (Excluded)

Besides being in charge of the legal department and of all land appraisal, purchase and condemnation, David E. Lilienthal will look after the distribution of power, including relations with purchasers and prospective purchasers; all matters relating to the operation of the hydro-electric and steam-electric plants at Muscle Shoals; construction and operation of transmission lines, development of standardized accounting. Methods for power generation, transmission, and distribution, and the supervision of accounting for [fol. 3487] the Authority; proposals to exchange power for power sites, and transportation rate problems.

This does not mean that the individual directors will formulate policies for their separate divisions. The board as a whole will continue to adopt all policies. It will be the duties of the directors to see that the board's projects are carried out in their respective channels.

The chief purpose of this apportionment of duties is to enable the Authority to launch its vast program as expeditiously and as efficiently as possible.

TVA Press Release of August 31, 1933

Address of Dr. Arthur E. Morgan Before the Kiwanis Club of Knoxville, Tennessee, August 31, 1933

* * * As the Tennessee Valley Law finally emerged from Congress it represented two kinds of purposes and aims. One kind was the definite purposes and aims to do specific things. One example of this was to make available to the public the power from the Wilson Dam at Muscle Shoals. Another purpose was to increase the steadiness and value of that power by building this large dam near your own city for the storage of water. Still another purpose was to connect those two with a transmission line so that the power could be regulated between them, and would be available along the way.

Coffeeville, Houston, Prairie, Starkville, West Point, Baldwyn, Gunton, Saltillo, Rienzi, Verona, Shanon, Sturgis, Longview, Bradley, Caledonia, Smithville, Tremont, Burnville, Halcut, Paden, Tishomingo, Denis, Plantersville, Golden, Kossuth, Mantachie, Dorsey, Mooreville, Ratlift, New Albany, Tibee, Mayhew, Artesia, Crawford, Brooksville, Shuqualak, Pontotoc, Canton, Indianola, Cedar Hill and Ripley.

Tennessee—Grand Junction, Lebanon, Newport, Pulaski, Milan, Jackson, Bolivar, Selmer, Henderson, Whiteville, Martin, Parsons, Bells, Dyer, Rutherford, Kenton, Trenton, Union City, Cash Point, Blanche, Elkwood, Toney, Harvest, [fol. 3493] Elora, Huntland, Beans Creek, Maxwell, Flintville, Lewisburg, Columbia, Manchester, Taft, LaFollette, Lenoir City, Dayton and Dickson.

Alabama—Muscle Shoals City, Town Creek, Courtland, Hillsboro, Wheeler, Moulton, Leighton, Decatur, Florence, Sheffield, Tuscumbia, Red Bay, Athens, Huntsville, St. Florian, and Bridgeport.

Georgia—Augusta and Dalton.
Kentucky—Paducah and London.
Missouri—Cape Girardeau.

[fol. 3494] COMPLAINANTS' EXHIBIT No. 789 (Excluded)

TVA Press Release of September 22, 1933

Construction of Dam No. 3 (the Joe Wheeler Dam) above Muscle Shoals is approved as a relief measure by the Tennessee Valley Authority providing the cost is met with public works money.

Chairman Arthur E. Morgan of the Authority has wired Secretary of the Interior Harold L. Ickes, and Senators Hugo L. Black and John H. Bankhead of Alabama, as follows:

"The Tennessee Valley Authority heartily approves the construction of Dam No. 3 above Muscle Shoals on the Tennessee River as an emergency employment relief measure, on condition that it is built with public works money and not with Tennessee Valley Authority money, and that the carrying charges and construction cost shall not be charged

COMPLAINANTS' EXHIBIT No. 789 (Excluded)

to the Tennessee Valley Authority until the demand for power justifies the construction for that purpose.

"The dam is an integral part of the navigation program for the Tennessee River, and will be a part of the power development program when it is needed. The only disadvantage to building the dam now is that it will not come into full use at once. This disadvantage may be overweighed by the great advantage of providing employment, by favorable [fol. 3495] construction prices and the fact that the construction of Dam No. 3 will be a substantial aid to navigation on the Tennessee River below Chattanooga. The navigation locks at Dam No. 3 are, in fact, now in process of construction by the Army Engineers.

"This position we conceive to be in the interest of the public welfare. The Board of Directors of the Tennessee Valley Authority took formal action to this effect."

The site of Dam No. 3 is at the head of Wilson Lake, in Alabama, about 16 miles above Wilson Dam.

[fol. 3496] COMPLAINANTS' EXHIBIT No. 790 (Excluded)

TVA Press Release of September 28, 1933

Address of David E. Lilienthal, Director of the Tennessee Valley Authority, before the Rotary Club of Chattanooga, September 28, 1933.

The Tennessee Valley Project is an opportunity and a challenge to the people of the South. It is an opportunity without parallel, for it puts behind your plans for regional development the leadership, the prestige, and the power of the President and the Congress of the United States. It is a challenge because the eyes of the entire Nation are focused upon the people of this valley, who in the spirit of their sturdy pioneer forebears are breaking new ground and establishing a national leadership.

• • • • • • •

Let us look at this problem in a cold blooded business way.

The Tennessee Valley Authority power program is not a taxpayers' subsidy. It is a business undertaking.

COMPLAINANTS' EXHIBIT No. 790 (Excluded)

You are business men. Many of you are manufacturers just as we are. We are both obligated to operate our business on a sound basis. As a manufacturer, you would consider as most unsound any suggestion that you double the capacity of your plant, even if your bank would advance the money, unless you were pretty sure that you would be able to develop a market for the increased product by the time the plant addition was completed. Rightly so, you [fol. 3497] would be most critical of us, were we to do the same thing.

We would be doing just that, if we authorized or approved putting on the market additional blocks of power from these proposed new dams, before the market of the area could absorb the power of Muscle Shoals and Norris Dams. That we must not do, for it would violate the expressed mandate of Congress and of the President to operate the present and future power facilities on a self-supporting basis.

* * * * * * *

The power program is one in which, of course, all of us are interested. The starting point in any discussion of the power policy and program of the Authority must be this: That the distribution of electricity is not like the usual private business, but, in the language of the ancient common law, is a business "affected with a public interest." By its very nature, the business of generation and distribution of power is a public business, because in our present-day community life we are all dependent upon that service. We need constantly to revert to this fundamental principle of the public character of the electric business.

How dependent we are upon power we sometimes fail to [fol. 3498] realize. It is in large measure due to electric power that for the first time in the history of civilization man is able to produce enough commodities to supply the necessities and even many of the luxuries to most of our people. We are fast approaching the mastery of production. It may well be that our chief difficulties in this depression center around the fact that we have not yet learned as a community to adjust ourselves to this revolutionary change.

This capacity to produce enough for all of us, which holds such great promise for a more universal and adequate

standard of living, has been made possible, in large part, by electric power. And we are just at the beginning of this power age. The future possibilities are as limitless as the practical imagination of our scientists and the ingenuity of our inventors. No wonder, then, that it is so vital that we maintain the strictest public control over this great natural resource. The public must protect its interests in so vital a force. There are various expedients to accomplish this result. One is by commission regulation. It is pretty well recognized that regulation has not been entirely adequate to protect the public interest, and so to supplement regulation, Congress has provided for a measure of public [fol. 3499] operation on a limited scale. This public operation is to serve as a yardstick by which to measure the fairness of electric rates. It has an additional function. It is a reminder that electricity is a public service and that unless it is exercised by private corporations with fairness, with efficiency, without financial jugglery and with a due sense of responsibility to the paramount public interests involved, that the public at any time, may itself assume the function of providing itself with this necessity of community life.

This power program is a constructive measure. Congress has not declared a national policy against the private ownership and operation of public utilities. It has merely provided for an additional measure of public protection against unreasonable or arbitrary conduct of a business which, by its very nature, is a matter of fundamental public concern.

What the Authority is trying to do in its power program is to set up an area for power operations which will be on a comparable basis with typical private operations. To set up such a "yardstick" the Authority obviously must undertake to serve an area which is large enough and sufficiently concentrated, with enough population density and with a sufficiently diversified industrial, commercial [fol. 3500] and residential load to provide a fair test. As business men it is apparent to you that if the Authority is only to serve the parts of a territory which a private utility has not chosen to serve, or is to serve only sparsely populated areas, the result of our operations cannot possibly be set up as a measuring rod. The Authority will necessarily

COMPLAINANTS' EXHIBIT No. 790 (Excluded)

have to undertake to serve an area of concentrated industrial territory, good farms and favorable distribution possibilities. It will, therefore, be necessary to include several cities of fair size in the area. The people of Knoxville and Birmingham are soon to vote on the acquisition of their distributing systems. We are now constructing a tie line between Muscle Shoals and the new dam at Cove Creek and we propose to enter into contacts with municipalities and other agencies desiring this service in the territory between those two points.

Obtaining this fair market in which to sell power, seems to be in sight, in view of the interest shown by about one hundred fifty municipalities. In fact, the problem of choosing between applicants will apparently be a real one.

* * * * * * *

As a new neighbor of yours, I appeal to you not to permit [fol. 3501] this opportunity for national leadership to fail through any lack of your support. I appeal to you to refuse to listen to the voices of those of little vision and of selfish purpose. This program will succeed only if you of the Valley treat this as a national project. I appeal to you to throw your energies and devotion into this national program which can mean so much to you and to your children.

[fol. 3502] COMPLAINANTS' EXHIBIT No. 791 (Excluded)

TVA Press Release of October 9, 1933

The Tennessee Valley Authority today called for bids on 675 miles of copper conductor for the tie transmission line to connect the Muscle Shoals power plant with Norris Dam near Knoxville. In an effort to spread employment, the Board of Directors announced that local labor will be utilized in the clearing of the right of way wherever feasible. Contracts will be made with the owners of the land across whose property the line is to extend. The owners will be permitted to retain the timber and will be required to pile and burn the brush. Special contracts, however, may be let wherever the right of way passes over large tracts.

COMPLAINANTS' EXHIBIT No. 791 (Excluded)

According to David E. Lilienthal, Director in charge of the Tennessee Valley Authority power program, this is the first of two transmission lines to be erected. While this line will furnish the current necessary for the construction of the Norris Dam, it is intended primarily as a tie line to connect the Wilson Dam power plant with the generators later to be installed at the Norris Dam. Later another line will be constructed along a different route so as to afford a wider distribution of power as well as to provide against interruption of service due to storms or accidents. The [fol. 3503] initial tie line will be 226 miles in length, or about eight miles longer than the air line distance between Wilson and Norris dams. An aerial survey of the right of way was recently completed.

Crossing the Tennessee River about 1,200 feet below the site of proposed Dam No. 3 near Muscle Shoals, the line will pass near the site of the proposed White Creek Dam and come within 23 miles of Chattanooga and 18 miles of Knoxville. The Board of Directors also decided to have the foundations for the towers where the line crosses the Tennessee River near Muscle Shoals installed by special contracts, with the Authority furnishing the necessary cement and foundation bolts. Contracts for the steel towers will provide for delivery and erection both in the case of river crossings and terminals and substations.

Not only will the construction of the tie line afford considerable employment at this time, Mr. Lilienthal pointed out, but will result in a saving for material costs which are expected to be much higher later on. In addition, the use of Muscle Shoals power in the construction of Norris Dam will pay the carrying charges on the line for almost two years.

[fol. 3504] COMPLAINANTS' EXHIBIT No. 792 (Excluded)

TVA Press Release of October 11, 1933

Chairman Arthur E. Morgan of the Tennessee Valley Authority will speak over the Columbia network from Station WJSV at Washington, D. C., at 3:30 P. M., Knoxville time, on Thursday. Local listeners probably will have to tune in on Station WHAS of Louisville if they care to hear this talk.

[fol. 3505] COMPLAINANTS' EXHIBIT No. 793 (Excluded)

TVA Press Release of October 12, 1933

The Tennessee Valley Authority Radio Talk for the American Legion, October 12, 1933

Arthur E. Morgan

When President Roosevelt outlined his recovery program, he planned for the spending of several billions of dollars for emergency work or relief. But he determined that, if possible, one undertaking should be of a different sort. Somewhere in America he wanted to see a beginning of social and economic planning.

In his message on the Tennessee Valley Authority he said that in the past America has "just grown" and that it is time this casual and haphazard development be replaced by design and forethought. He chose the Tennessee River region as the site of such an undertaking, and the Tennessee Valley Authority is the organization set-up to give expression to that hope.

Mr. Tugwell, in one of his articles discussing the President's program, says this of the Tennessee Valley Authority:

"This work carries more significance for the future than any other single attempt of the Administration to make life [fol. 3506] better for all of us. It is in no sense emergency as so many other actions have necessarily been. It did not have to be done to stave off financial panic or avert war, or to relieve distress. It is a deliberate turning toward the future, a commitment to an ideal. Its success can depopulate cities, destroy a thousand intrenched privileges, invalidate a whole tradition of single-hearted self interest."

Mr. Tugwell tells me that he discussed the project with the President before writing this article, and it is in line with what I myself have heard from the President.

In addition to the general program of economic planning, the Tennessee Valley Authority Act provides for two clearly defined projects. They are the generation and transmission of power, and the development of cheaper fertilizer.

COMPLAINANTS' EXHIBIT No. 793 (Excluded)

The Wilson Dam at Muscle Shoals can produce a variable amount of power. When the Tennessee River is high, there is water enough to develop three hundred thousand horsepower or more. When the river is very low, there is water enough for only fifty thousand. By building the Cove Creek Dam, now called the Norris Dam, on the Clinch [fol. 3507] River, which is a branch of the Tennessee above Muscle Shoals, a vast storage reservoir will be formed which will regulate the flow and also produce power. With this regulation the dependable power will be increased about four times. A transmission line will unite the two power plants. The power program is to transmit electric current to cities and towns and rural communities, and to sell it at rates that will encourage widespread use. As soon as a market is established, this part of the program should be self-sustaining. A great increase in the use of electric power for household and farm use will be a powerful element in improving social and economic welfare.

• • • • • • •

The Tennessee Valley region contains twice as many people in rural areas as are necessary for agricultural work. It should be possible to develop local industries, with the help of cheap power, that will enable these communities to manufacture what they would like to buy. With an intelligent and ambitious population, great natural resources, and cheap power, human ingenuity should bring to an end the present wide-spread want and idleness.

[fol. 3508] COMPLAINANTS' EXHIBIT No. 794 (Excluded)

TVA Press Release of October 13, 1933

Statement by David E. Lilienthal, TVA director in charge of power development:

Determined efforts are being made to inject the Authority into local situations in which voters are considering the policy of acquiring their electric distribution systems and then contracting with the Authority for low cost Muscle Shoals power. These local questions are matters for the

COMPLAINANTS' EXHIBIT No. 794 (Excluded)

citizens of each community to decide for themselves. It should, however, be obvious that the Authority does not have enough power to supply all the communities in the area and that, therefore, the rule of "first come, first served" will almost be a necessity.

[fol. 3509] COMPLAINANTS' EXHIBIT No. 795 (Excluded)

TVA Press Release of October 15, 1933

In addition to providing for the enrollment of young men from local areas, the Tennessee Valley Authority has announced that five thousand experienced forest workers, members of the Civilian Conservation Corps, will leave Idaho today and tomorrow for the Tennessee Valley to begin work of reforestation, flood control and soil erosion in the Norris Dam Watershed and in the vicinity of Muscle Shoals.

Chairman Arthur E. Morgan said that definite locations have been selected for twenty-five camps to provide living quarters for these units. Twenty camps providing for 4,000 men will be located on the Norris Dam Watershed. Five camps to house 1,000 men will be erected on the 1,200 acre Government reservation at Nitrate Plant No. 2 at Muscle Shoals. Each camp will provide for approximately 200 men.

The arrival of these units will mark the beginning of a widespread attack on the problem of flood control and soil erosion in the Tennessee Valley, Edward C. M. Richards, forester and head of the Forestry and Soil Erosion Department of the Tennessee Valley Authority, said today.

[fol. 3510] "We have arranged to bring these young men to the Valley to carry out a very important part of the Tennessee Valley Authority's program." Mr. Richards added. "It is evident that when the Government invests a large sum of money in a power system, this investment should be protected against destruction through floods and the silting up of the storage reservoirs. This is particularly important in the case of the Norris Dam-Muscle Shoals development.

[fol. 3511] COMPLAINANTS' EXHIBIT No. 796 (Excluded)

TVA Press Release of October 17, 1933

Address of David E. Lilienthal, Director and General Counsel, Tennessee Valley Authority, Before the Rotary Club of Memphis, Oct. 17, 1933.

Seated before an open fire in his home in Warm Springs last February, Franklin D. Roosevelt formulated and expressed a new national policy for the development of the resources of our country. In one of his first informal conversations with the people, he told of his plan for the development of the Tennessee River Valley—a plan which marks the beginning of a new departure in American economic and political history.

* * * * * * *

This Tennessee Valley project is an opportunity and a challenge to the people of the South. It is an opportunity without parallel, for it puts behind your plans for regional development the leadership, the prestige, and the power of the President and the Congress of the United States. It is a challenge because the eyes of the entire nation are focused upon the people of this area, who in the spirit of their sturdy pioneer forebears are breaking new ground and establishing a national leadership.

* * * * * * *

I want to talk to you first about the immediate program [fol. 3512] for today and what the Authority is doing to carry that forward. In order to expedite matters, the Board some weeks ago determined to divide initial responsibility for the execution of this program among its three members. To Chairman Arthur E. Morgan went the heavy responsibility for the construction of the dam at Cove Creek, which will be one of the largest power dams in the country when it is completed. * * *

* * * * * * *

In addition to the construction work going on at the Norris Dam, work is under way on the transmission line between the Wilson and Norris Dams. The Aerial survey

for the lines has been completed. Easements are being purchased. * * * Bids will be received on October 20th for 675 miles of wire. Coincident with this bids will be asked for the clearing of the right of way, for the construction of the foundations and for the construction of the transmission line towers.

* * * * * * *

The power program of the Authority is an important part of its present plans and of the long-range regional program. The starting point in any discussion of this power policy and program must be this: That the distribution of electricity is not like the usual private business, but, [fol. 3513] in the language of the ancient common law, is a business "affected with a public interest." By its very nature, the business of generation and distribution of power is a public business, because in our present day community life we are all so utterly dependent upon that service. We need constantly to revert to this fundamental principle of the public character of the electric business.

What power has done for us and what promise it holds we often fail to realize. It is in large measure due to electric power that for the first time in history we are equipped to produce enough commodities to supply the necessities and even many of the luxuries to most of our people. The future possibilities are limitless. Of "the promise of power, Mr. Stuart Chase recently said: "We are witnessing the oncoming of a new kind of civilization as electric power displaces older other power forms. It will shift populations, change the map, profoundly affect both the number and the skills of workers, revise—upward—the quality and variety of commodities, break down the division between country man and city man; and, if it is not wrecked by the brute claims of an obsolete financial system, it promises a world replete with more freedom and happiness than mankind has ever known * * * Electricity can give us universally [fol. 3514] high standards of living, new and amusing kinds of jobs, leisure, freedom, an end to drudgery, congestion, noise, smoke and filth."

Is it any wonder then that the people are determined to maintain the most vigilant public control of this liberating

force? Various expedients for the public's protection have been adopted. One is regulation by state commissions. It is generally recognized that such regulation has not been entirely adequate to protect the public interest. And so, to supplement regulation, Congress has provided for a measure of public operation on a limited scale. This public operation is to serve as a yardstick by which to measure the fairness of electric rates. It has an additional function. It is a reminder that electricity performs a public service and that unless it is exercised by private corporations with fairness, with efficiency, without financial jugglery and with a due sense of responsibility to the paramount public interests involved, that the public, at any time, may itself assume the function of providing itself with this necessity of community life.

This power program is a constructive measure. Congress has not declared a national policy against the private [fol. 3515] ownership and operation of public utilities. It has rather provided for an additional measure of public protection against abuses in the conduct of a business which, by its very nature, is a matter of fundamental public concern.

What the Author[redacted]is required to do in its power program is to set up an area for power operations which will be on a comparable basis with typical private operations. To set up such a "yardstick" the Authority obviously must undertake to serve an area which is large enough and sufficiently concentrated, with enough population density and with a sufficiently diversified industrial, commercial and residential load to provide a fair test. As business men, it is apparent to you that if the Authority is only to serve the parts of a territory which a private utility has not chosen to serve, or is to serve only sparsely populated areas, the result of our operations cannot possibly be set up as a measuring rod. The Authority will necessarily have to undertake to serve a balanced area of concentrated industrial activity, including some cities of substantial size, good farms and reasonably favorable distribution possibilities.

The Board of the Tennessee Valley Authority some weeks ago directed the formulation of wholesale rate

COMPLAINANTS' EXHIBIT No. 796 (Excluded)

[fol. 3516] standards to form the basis for contracts for power with municipalities and other agencies within the yardstick area. Since the statute imposes a measure of responsibility upon the Authority for the rates charged to the ultimate consumers of electricity, a proposed schedule of rates to the householder and farmer was also worked out. * * *

* * * * * * *

I suppose it is obvious that all computations concerning costs are based on the expectation that the Authority will sell the power which it has available. Muscle Shoals was turned over to us as a going plant, but not as a going concern with customers. Obviously, if we sell only one kilowatt hour, our cost will be hundreds of thousands of dollars a kilowatt hour rather than a few mills. If the power is not utilized in volume, no one will receive the great potential benefits of the wealth of the Tennessee River. It is axiomatic in the electric business that an increase in use decreases the cost per unit of output. Accordingly, we look forward to a maximum use of our facilities, because it is in that way that the Authority and those agencies which buy its power at wholesale can steadily bring down rates to the householder, the farmer and the business man, and [fol. 3517] bring to this area the economic and social benefits of the President's plan.

* * * * * * *

As a new neighbor of yours, I appeal to you not to permit this opportunity for national leadership to fail through any lack of your support. I appeal to you to refuse to listen to the voices of those of little vision and of selfish purpose. This program will succeed only if you of the area treat this as a national project. I appeal to you to throw your energies and devotion into this national program which can mean so much to you and to your children.

* * * * * * *

[fol. 3518] COMPLAINANTS' EXHIBIT No. 797 (Excluded)

TVA Press Release of October 20, 1933

What Difference Will the Tennessee Valley Authority Make?

Talk at Chamber of Commerce Meeting, Asheville, North Carolina, October 20, 1933, by Arthur E. Morgan, Chairman of the Board, Tennessee Valley Authority

* * * Wilson Dam was undertaken as a war measure. Its completion after the war was opposed by those who insisted that the generation and distribution of power should be solely a private industry. Finally Wilson Dam was completed, and then it lay almost idle for six years while a contest was fought out in Congress between the advocates of public and those of private generation and distribution of power. Twice Congress passed bills for the public operation of the Wilson Dam power plant, but each time the bill was vetoed by the President. Finally President Franklin Roosevelt proposed a general program of public generation and transmission of power as a part of the Tennessee Valley Authority program. One of his aims was to prepare a "yard stick" of public ownership. In this division of work among the directors, that of trans-[fol. 3519] mitting and selling power was assigned to Mr. David Lilienthal.

The law provides that power from Muscle Shoals or from other developments must be sold primarily for domestic use in cities and rural areas. Sales can be made to private power companies or for manufacturing purposes, but household and farm use shall have first place.

The Wilson Dam power plant at Muscle Shoals is called a "run of the river" plant. That is, there is very little storage of water in the lake above the dam in the Tennessee River. When the Tennessee River is high during the winter there is an abundance of water, and therefore an abundance of power. During the driest summer seasons the flow is small and therefore only a relatively small amount of power can be developed. To correct this wide variation of flow the Tennessee Valley Authority Act provides for the construction of the Norris Dam and power plant on the Clinch River more than 200 miles upstream from

Muscle Shoals. In the distribution of work among the directors, the building of this and other dams fall- to me. The Norris Dam, formerly called the Cove Creek Dam, will create a great storage reservoir, great enough to store [fol. 3520] almost a year's rainfall. By operating the Norris Dam and power plant and the Wilson Dam and power plant as a single system, a very great increase of power is possible. During the winter, when the Tennessee River is high and power is abundant at Muscle Shoals, the Norris Dam plant will be shut down and the water will be stored in the reservoir. During the summer when the Tennessee River is low and power is scarce the Norris Dam power plant will be operated. The water used for generating power at the Norris Dam will then flow down to the Wilson Dam where it will be used again to develop more power. The two dams operate- as a single system will generate about six times as much dependable power as either one alone. A transmission line is provided for in the law to connect these two plants and to regulate the supply of power between them. Materials are now being purchased and the land cleared for building that line.

• • • • • • •

Further down on the Tennessee River are other power projects. I spoke of the Wilson Dam project as a "run of the river" power plant. That is, it develops a large amount of power in high water and a small amount in low water. [fol. 3521] Now the management of a power plant up here in Western North Carolina has a great deal to do with the nature of a plant lower down. If the plant on the upper branches, with a large storage reservoir is run for its own industry alone, then it must use its water somewhat uniformly throughout the year. That which is let down during the summer helps the power plants down the river, where summer power is scarce. But the water let out of the upper reservoir during the high water season of winter and spring is wasted below, for there is already more water in the lower river than is needed.

If the up-river plants and down-river plants are connected by transmission lines and are oper ted as a single system, a different result can be achie . During high water in the winter the lower plants, where there is no

storage, will be run to full capacity. The upper plants that have a large amount of storage will shut down and will save their water, and will use electricity from the down-river plants. Then during low-water in summer, when the down-river plants do not have enough water, the up-river plants will draw on their storage reservoirs and will produce power in larger quantities when it is most needed. Not only that, [fol. 3522] but the water which passes through the up-river plants must pass through every power plant on the Tennessee River all the way down to the Ohio River, and produces power at each one at the time of year when it is needed most.

By operating the entire Tennessee River and its branches as one organized system under government control, the value of the power developed would probably be at least twice as great as though the various developments should be operated independently. The exchange of power among private companies does not eliminate these wastes, though it may reduce them. Here is a practical case of economic planning which is possible of achievement.

Now, in closing, how does this directly affect North Carolina?

Personally, I should hope that in the spreading system of power plants North Carolina would soon be included, as soon as demand for power may justify an increase of supply. • • •

[fol. 3523] COMPLAINANTS' EXHIBIT No. 798 (Excluded)

TVA Press Release, of November 4, 1933

The Tennessee Valley Authority today awarded a contract for 675 miles of aluminum conductor cable, steel reinforced, to the Aluminum Company of America. The conductor is to be used in the construction of the tie transmission line between Muscle Shoals and Norris Dam.

The Aluminum Company's bid of $400,149.39 for the conductor and accessories showed a saving of approximately $278,000 over the next lowest bid. This represents a sum equal to the cost of operating the Muscle Shoals power plant for more than a year.

COMPLAINANTS' EXHIBIT No. 798 (Excluded)

The acceptance of the Aluminum Company's bid was recommended by Llewellyn Evans, chief electrical engineer for the Authority, and his recommendation was approved after extensive study by other engineers of the Authority. The bid was accepted by the Board after consultation with the Bureau of Standards.

In accordance with the standard practices of the TVA, all bidders were required to show compliance with the applicable rules and regulations of the NRA.

The tie transmission line is approximately 228 miles long and will pass within 23 miles of Chattanooga and about 18 [fol. 3524] miles of Knoxville. Acquisition of right of way for the line is already under way. Contracts for clearing the right of way and installing foundations will be let in localized groups so as to spread benefits over the entire distance traversed by the line.

[fol. 3525] COMPLAINANTS' EXHIBIT No. 799 (Excluded)

TVA Press Release of November 7, 1933

Address of David E. Lilienthal, Director and General Counsel, Tennessee Valley Authority, Before Joint Meeting Rotary Club, Chamber of Commerce and Exchange Club of Nashville, Tennessee, November 7, 1933

* * * * * * *

This Tennessee Valley Project is an opportunity and a challenge to the people of the South. It is an opportunity without parallel, for it puts behind your plans for regional development the leadership, the resources and the power of the President and the Congress of the United States. It is a challenge because the eyes of the entire Nation are focused upon the people of this area, who in the spirit of their sturdy pioneer forebears are breaking new ground and establishing a national leadership.

* * * * * * *

The power program of the Authority is an important part of its present plans and also of the long range regional [fol. 3526] program. The starting point in any discussion

of this power policy and program must be this: That the distribution of electricity is not like the ordinary private business. By its very nature, the generation and distribution of power is a public business, because in our present day community life we are all so utterly dependent upon that service.

What power has done for us and what promise it holds, we often fail to realize. It is in large measure due to electric power that for the first time in history we are equipped to produce enough commodities to supply the necessities and even many of the luxuries to most of our people. And we are witnessing but the beginning of the power age. The future possibilities are limitless. Of "the promise of power," Mr. Stuart Chase recently said: "We are witnessing the oncoming of a new kind of civilization as electric power displaces older power forms. It will shift populations, change the map, profoundly affect both the number and skills of workers, revise—upward—the quality and variety of commodities, break down the division between country man and city man; and, if it is not wrecked by the brute claims of an obsolete financial system, it promises a [fol. 3527] world replete with more freedom and happiness than mankind has ever known. * * * Electricity can give us universally high standards of living, new and amusing kinds of jobs, leisure, freedom, and end to drudgery, congestion, noise and smoke." Is it any wonder then that the people are determined to maintain the most vigilant public control of this liberating force?

In order to comprehend fully the reasons for the power program set out in the Tennessee Valley Authority Act, it is necessary to recall what has been happening in the United States during the past ten years. It is necessary to understand that the people back home have become thoroughly aroused; that they are determined that the disgraceful looting of the public business of power shall not be repeated. You are all familiar with the sordid story. I need not recall to your minds the quarter of a million dollars which that leading citizen of Greece, Mr. Samuel Insull, paid to the Chairman of the State Commission which was supposed to be regulating his Illinois utilities. Those of you who are investors are familiar with the story of how some operating utilities were bled by speculating holding companies, of the

dizzy pyramiding of stocks, of write-ups, of unconscionable [fol. 3528] bonuses, of the purchase of utility plants at outrageously high figures and the issuance of securities on the basis of such prices. Instances of those practices can be cited to you from coast to coast.

I have no desire to intimate that every public utility followed such practices. There were many notable exceptions. But there can be no question that in the last decade the power business was dominated by financial pirates.

Nor have the people back home forgotten the story which was revealed by the Federal Trade Commission in its investigation of the propaganda activities of the electric industry. There has never been a bolder attempt to buy the public opinion of the people of the United States. That widespread scheme of capturing the sources of public information would have destroyed the American system of democracy which Jefferson and Jackson established.

The attempt to gain editorial favor and color the news through advertising contracts was one of the most brazen steps in this program. A few years ago the publicity director for the utilities for Tennessee made the following report: "Our advertising campaign started in the middle of January and since that time advertising has been carried [fol. 3529] in more than 100 papers in Tennessee. These were placed during a personal call on the editors, at which time an occasion was taken to discuss the matter with the editors, and place before them the facts as we see them. We have approximately forty favorable editorials written on this matter * * * at a cost of less than $700.00, we have been able to get our story in papers whose combined circulation is approximately 350,000, and as a result of these advertisements and our personal contact with the editors we have received a very large number of favorable editorials."

Now this is what had been going on throughout the United States. Regulation by commission had in many states proved ineffectual. In some states it was perfectly obvious that the regulators were not regulating the utilities, but in effect the utilities were regulating the regulators. In other states, the regulatory commissions were doing an honest and sincere job, but were hampered by the interminable procedure of regulation. And so, to supple-

ment regulation by Commissions, Congress passed the Tennessee Valley Authority Act. This Act is not an assault upon private ownership and management of public utilities. But it is a determined attack on private mismanagement of [fol. 3530] the public business of power at the expense of the people back home—consumers and investors alike.

* * * * * * *

This public operation is to serve as a "yardstick" by which to measure the fairness of electric rates. It has an additional function. It is a reminder that electricity performs a public service. It is a reminder that unless that business is carried on by private corporations with fairness, without financial jugglery and with a due sense of responsibility to the paramount public interest, that the public, at any time may assume the function of providing itself with this necessity of community life.

What the Tennessee Valley Authority is required to do in its power program is to set up an area for power operations. That area is to be on a comparable basis with typical private operations. To set up such a "yardstick" the Authority obviously must undertake to serve an area which is large enough and sufficiently concentrated, and with an adequately diversified industrial, commercial and residential load to provide a fair test. As business men, it is apparent to you that if the Authority is to serve only the parts of a territory which a private utility has not chosen to serve, or is to serve only sparsely populated areas, the result of our operations cannot possibly be set up as a measuring [fol. 3531] rod. The Authority will necessarily have to undertake to serve a balanced area, including some cities of substantial size, good farm territory and reasonable faborable distribution possibilities.

* * * * * * *

The Authority is under a duty to promote the widest possible use of electricity. The rate charged the ultimate consumer by those who purchase electricity from the Authority is, therefore, a proper subject of such a contract as that with the City of Tupelo. The domestic rates which Tupelo proposes to charge its citizens are identical with

those suggested by us in a public statement released on September 15. Those rates are as follows: For the first 50 kilowatt hours per month 3 cents per kilowatt hour; for the next 150 kilowatt hours 2 cents per kilowatt hour, for the next 200 kilowatt hours 1 cent. The excess over 400 kilowatt hours, four mills per kilowatt hour. A minimum monthly use is provided for. A householder in Tupelo using fifty kilowatts per month at the present time pays $3.50. After Tupelo is operating under the terms of this contract, he will pay $1.50 or 57.2 per cent less.

The industrial rates which the city of Tupelo proposes to put into effect will be of benefit to that community. For ex- [fol. 3532] ample, a large cotton mill in Tupelo for one month's electric supply in 1933 paid $3375. Its bill under new rates to be put into effect by Tupelo would have been $1865; a saving of $1510, or 44.7 per cent.

The Commercial lighting bills are equally interesting. At the present time, a user of commercial power consuming 500 kilowatts per month pays $34.00 a month. Under the contract to which Tupelo has agreed, the cost will be $13.75, a saving of $20.25, or 59.4 per cent reduction.

The Authority is planning to throw its energies and resources into a program of electrification of Lee County. The combined efforts of Tupelo, the Lee County Farmers Power Association and the Tennessee Valley Authority will produce definite results in the next three years. The consumption of power in the city of Tupelo is going to greatly increase. These people are determined even to make sacrifices in order to show the country that when Tupelo sets out to accomplish a great enterprise that the spirit and community pride of that city will conquer every difficulty. The rates which Tupelo has established for domestic, commercial and industrial purposes are going to bring great changes and benefits to this community. They are casting aside all [fol. 3533] the warnings of the timid, and in the spirit of the New Deal, are going forward to a more prosperous city and country and a fine balance between industry and agriculture.

Industrialists will become interested in Lee County. There will be many inquiries about the feasibility of locating small factories within this area where they will have the benefits of low cost of power, a high grade of people with which to

work and community leadership. The people of Tupelo are not interested in a huge industrial city, for they know of the ills which accompany such an enterprise. They prefer to continue as they have begun, with a sane development in which the city and the farmer work hand in hand toward a stable prosperity for both city and country.

The rural areas will greatly benefit from the leadership and the organizing ability which the farmers of this area have exhibited. The Authority plans to put at the disposal of this alert group of farmers the services of technical experts. The most economical means of building farmers lines through cooperatives will be worked out. Plans for refrigeration, for water pumping and for making farm life more pleasant will be the subject of cooperative study and activity for the Farmers Association and the Tennessee Valley Authority. Lee County we believe will give a picture [fol. 3534] of what power can do in the hands of townspeople and farmers who are determined to secure its full benefits.

I do not want to be misunderstood; what Tupelo agrees to do and what the Authority agrees to do cannot be done in every community. It cannot be done in a community in which the municipal utility is left the subject of political fortune. It cannot be done where the people of the community are not actively interested in the success of the enterprise. It cannot be done where the city officials are timid or badly advised. It cannot be done where the city officials are not free agents, but have been bought and paid for by private interests.

* * * * * * *

Here is an opportunity for industry and for government to display qualities of statesmanship. The Authority must carry out the national policy entrusted to it. It must acquire a market for its power. It must work toward a wider use of electricity in the home, the farm and the factory. All of these objectives can be reached without the predicated calamities to the industry and its bona fide investors. If the Authority succeeds in its plans to develop new uses for electricity, and by low rates and wide distribution of low cost appliances can increase existing uses, private utilities

COMPLAINANTS' EXHIBIT No. 799 (Excluded)

[fol. 3535] and the electric manufacturers can both share in the benefits. If in acquiring a market we can use existing facilities of private utilities, of course we will pay a fair price for them. By contracts with private utilities for interchange of power, economies and service betterment can be effected in which the utilities will derive benefits. I could cite other concrete instances to the same point. There will be room for both private and public operations, and both can succeed, if fair dealing and moderation prevail over councils of warfare and malice. If there is a genuine desire to work with this project and not to obstruct or destroy it, ways and means can and will be found for the electrical industry and government to work without friction in expanding the use of electrical energy for the benefit of all of our people.

* * * * * * *

As a new neighbor of yours, I appeal to you not to permit this opportunity for national leadership to fail through any lack of your support. I appeal to you to refuse to listen to the voices of those of little vision and of selfish purpose. I appeal to you to throw your energies and devotion into this national program which can mean so much to you and to your children.

[fol. 3536] COMPLAINANTS' EXHIBIT No. 800 (Excluded)

TVA Press Release of November 11, 1933

"A Five Point Program for the Electrification of America"

Address of David E. Lilienthal, Director and General Counsel, Tennessee Valley Authority, before the Lawyers Club. Atlanta, Georgia, Friday Evening, November 10, 1933.

The Tennessee Valley Authority Act marks the beginning of a new national power policy and national power program. This new national policy has two major objectives. The first objective is more effective protection of the public interest, by the setting up of a measure of public operation of power as a "Yardstick." The second objective of this new national policy is a greatly increased use

of electricity in the homes, the farms, and the factories of the United States—an electrified America.

The President and the Congress have set themselves [fol. 3537] to the task of putting to work the vast sources of electricity which lie idle and unused. We are working toward no less a goal than the electrification of America. The plans have been laid. Legal authority is ample. The economic difficulties can be overcome. The project is practical and feasible. The program can be carried out. Within the next decade it lies within the power of the people of the United States to make electricity in very truth the servant of the average man and woman in the homes, farms and places of business of this country.

The power program of the Authority is a crucial part of its plans for immediate action and of the long range program for the development of this region. This power program is of particular interest not only within the valley, but it has and is intended to have a national significance. For the problems which center about the power question here in the Southeastern region of the United States are questions not peculiar to this area, but which are common to the country as a whole.

* * * * * * *

The national power policy of the President and the Congress written into the Tennessee Valley Authority Act recognizes that electric power, next to the soil, is our greatest [fol. 3538] resource. It recognizes that the people must maintain public control of this liberating force. This is the first objective of the national power policy to which I have referred.

* * * * * * *

Now that is what had been going on throughout the United States. Regulation by commissions had in many states proved ineffectual. In some states it was perfectly obvious that the regulators were not regulating the utilities, but, in effect, the utilities were regulating the regulators. In other states, the regulatory commissions were doing an honest and sincere job, but were hampered by the interminable procedure of regulation, with rate cases sometimes dragging through a decade. And so, to supplement regulation by

commissions, Congress passed the Tennessee Valley Authority Act. This Act is not an assault upon private ownership and management of public utilities. But it is a determined attack on private mismanagement of the public business of power at the expense of the people back home—consumers and investors alike.

• • • • • • •

It was with such a background that Congress passed the Tennessee Valley Authority Act, and set up a measure of public operation of the power business. This public opera- [fol. 3539] tion is to serve as a yardstick by which to measure the fairness of electric rates. It has an additional function. It is a reminder that electricity performs a public service. It is a reminder that unless that business is conducted by private corporations with fairness, without financial jugglery and with a due sense of responsibility to the paramount public interest, that the public at any time may itself assume the function of providing itself with this necessity of community life.

What the Tennessee Valley Authority is required to do in its power program is to set up an area for power operations. That area is to be on a comparable basis with typical private operations. To set up such a "yardstick" the Authority obviously must undertake to serve an area which is large enough and sufficiently concentrated, and with an adequately diversified industrial, commercial, and residential load to provide a fair test. As business men, it is apparent to you that if the Authority is to serve only the parts of a territory which a private utility has not chosen to serve, or is to serve only sparsely populated areas, the result of our operations cannot possibly be set up as a measuring rod. The Authority will necessarily have to undertake to serve a balanced area, including some cities of substantial size, good farm territory, and reasonably favor- [fol. 3540] able distribution possibilities.

This power program is a constructive measure. Congress has not declared a national policy against the private ownership and operation of public utilities. It has rather provided for an additional measure of public protection against abuses in the conduct of a business which, by its very nature, is a matter of fundamental public concern.

COMPLAINANTS' EXHIBIT No. 800 (Excluded)

So much for the first objective of the Tennessee Valley Authority—the regulatory, public control purposes of this national power policy. We come then to the second objective, of at least equal significance.

The power program of Congress and the President has as its major objective a constantly wider use of electricity. The goal of this national power policy is a constructive one: it is nothing less than the electrification of the homes and farms of the United States. • • •

• • • • • • •

Looking at the country as a whole, without respect to public operation or private operation, it is perfectly evident that we now have and soon will have a tremendous surplus supply of electricity. Within the area of the Tennessee Valley for example, privately owned electric companies have generating and transmission facilities which [fol. 3541] can care for between 30% and 40% more demands for electricity than is now required, even allowing for reasonable spare capacity. A fair estimate is that 25 per cent of the investment in power houses and transmission lines is idle, and is piling up fixed charges, because the customers of these companies are still tied to a low average use of electricity. The Tennessee Valley Authority has a hydro-electric plant at Muscle Shoals with a rated installed capacity of 250,000 hp. But that is only the beginning of the story. The Authority is constructing a dam and power house at Cove Creek, and another dam and power house above Muscle Shoals at what is known as the "Joe Wheeler" dam, which, together will increase the capacity of Wilson Dam to at least 600,000 hp. • • •

• • • • • • •

I suggest a 5-point program which I should first like to enumerate and then discuss more in detail:

1. We must begin thinking in terms of an electrified America, and cast aside the tradition which is binding us to our present niggardly use of electricity.

2. Our entire electric rate structure must be re-examined and drastically revised.

COMPLAINANTS' EXHIBIT No. 800 (Excluded)

3. Electric-using appliances must be put into the homes and on the farms on a scale heretofore not successfully attempted.

[fol. 3542] 4. All the forces of business, scientific, and engineering ingenuity and technique must be concentrated upon the problem of reducing certain of the costs of operation.

5. The people of the country must be brought to realize that there is a pool of electricity lying idle, ready and waiting to be used, and to realize what electricity can do in lightening their burdens, in increasing their incomes and making for a richer and better life.

Turning to the first point of the program. If we load our minds with the idea that because a thing has not been done that it cannot be done, we might as well admit complete defeat in this whole program. If we admit that the use of electricity cannot be increased many fold; if that is our mental attitude, then we must be logical and immediately stop construction of the Cove Creek dam and of the Joe Wheeler dam. * * *

* * * * * * *

Second: The revision downward of electric rates. In my considered judgment the greatest single obstacle in the way of a widespread use of electricity has been the rates which have been charged for electricity. We believe that, with notable exceptions, the rates for electricity throughout the United States constitute a barrier between the people and [fol. 3543] the great resource of electricity. A drastic revision downward of electric rates is an essential part of this program. Such drastic reductions in electric rates, in our judgment are essential to any substantial increase in the use of electricity for domestic, farm, and industrial purposes. It is our opinion, amply supported by experience, that the effect of such drastic provision will not result in a decrease in gross revenues, or in net income, if the revisions are thorough-going and skillfully made.

Some weeks ago at the direction of the Board of the Authority, a proposed standard of domestic and farm rates was announced, which were recommended to those com-

munities and farm organizations which might desire to enter into contracts with the Authority for power at wholesale. Those rates represent our views as to the first step in a drastic downward revision of electric rates, essential to a wider use of electricity. * * *

* * * * * * *

Now the reasons for the existing rate schedules are many. Part is due to tradition. There is a tremendous accumulation of musty legal theory and outmoded engineering practices in the field of electric rates. Part of it is due to the fact that domestic and farm electric service is monopolistic; [fol. 3544] and it is typical of monopolies that they change their practices very slowly, if at all. In many cases it is due to pressure of an outrageous capital structure, to bad management, to lack of foresight. We believe that definite plans of the Authority now in process of execution afford the quickest means of accomplishing a thorough revision of rate schedules and rate theories throughout the country, and with it, an increase in the use of electricity. This is an essential part, as I see it, of the new national power program inaugurated by the Tennessee Valley Authority Act.

Third. Wide distribution of electric-using appliances. We then are faced with this situation: We have and are in process of constructing a tremendous pool of power for the nation, most of which is in private ownership; a considerable percentage of which is represented by Government investment. A large portion of these power facilities will be idle and unused and a burden upon the investors and on the taxpayer unless we can get electricity through to the people on a broad scale. Low rates which will promote and encourage the use of electricity is an essential part of this program. But low rates alone will not do the job. The people must have in their homes and on their farms the appliances, the devices, by which electricity is used. Par- [fol. 3545] ticularly, they must have the heavy use appliances: In the home, they must have electric ranges, electric water heaters, refrigerators, and the like, with house heating and air conditioning within the range of probability. On the farm they must have motors for many purposes, and water pumps, as well as domestic appliances.

The existing methods of getting these appliances to the average man and woman also requires drastic revision if a widespread electrification program is carried out. It is probably accurate to say that the principal item of cost in getting these appliances into the homes and on the farms has not been the cost of materials and labor in their construction, but has been the cost of financing and selling; in other words, distribution. The 200 odd electric manufacturers of the country are equipped today to turn out the hundreds of thousands of heavy use electric appliances which the people of the country want and which, under a properly planned program, they can pay for. In fact, with proper rates, the bulk of our people literally cannot afford not to own and use such appliances. But I repeat, low rates alone are not enough. Without large-scale distribution of low-cost appliances, there will never be a widespread use of electricity. I am calling this matter of electric appliances to your attention because it should be an integral [fol. 3546] part of this national program. Anyone who leaves this factor out of consideration is not thinking this matter through.

There are difficulties in the way of effectuating a wide distribution at low cost, of standardized high-quality electric appliances which the manufacturers of this country are producing. These difficulties are by no means insuperable. While I am not at liberty to discuss the matter at this time, I would be less frank than I have a right to be if I did not say that a definite plan for this phase of the program is approaching completion, with the co-operation of many interests.

Fourth. Reduction in costs. Time does not permit of a discussion of our program looking toward reductions in operating and construction costs. Here again we need and will receive co-operation from many sources. To meet the mounting cost of complexities and of losses in transmission net-works is particularly a subject upon which the Authority hopes to make a contribution. A reduction in costs will inure to lower rates and constantly increase use of electricity.

And then the last point in this program: We must all of us begin to think in terms of an "Electrified America."

COMPLAINANTS' EXHIBIT No. 800 (Excluded)

We must keep before our minds the great potential wealth [fol. 3547] which is lying at our doors, now idle. What American people want badly enough—they get—whether it is the conquering of a wilderness, an education for every child, or a decent and orderly revision of our entire economic structure. The imagination of our people must be fired with the prospect of electrified homes. Farmers must be given a picture of what electricity can do to relieve farm life of many of its burdens. The business man must come to see the possibilities for commercial and industrial development which lie ahead, if such a program is carried out.

[fol. 3548] COMPLAINANTS' EXHIBIT No. 801 (Excluded)

TVA Press Release of November 15, 1933

Washington, Nov. 15.—Terms and conditions for the sale of electricity by municipalities purchasing power from the Tennessee Valley Authority were announced here today by David E. Lilienthal, director in charge of power development.

In making public the details of the initial TVA contract for the sale of Muscle Shoals energy, Director Lilienthal also made known the industrial and commercial rates which supplement the Authority's standard residence and wholesale rate structure made public September 15th last.

* * * * * * *

Under this contract a user of 500 kilowatts of commercial power per month pays $13.75; a saving of $20.25 as compared with the present Tupelo rate.

The 20 year agreement between the TVA and Tupelo is expected to set a standard for contracts with other municipalities within transmission distance of Muscle Shoals. Besides rate schedules, the Tupelo contract carries with it certain rules and regulations applicable to all TVA customers. Among other things, Tupelo agrees:

"(a) To administer its electric system as a separate [fol. 3549] department and not to mingle funds or accounts with those of any other of its operations.

"(b) To keep its electric system accounts according to a system of accounts to be prescribed by Authority after conference with Contractor, which system of accounts will so far as possible be uniform with other systems prescribed and applied in other municipalities purchasing electrical energy from Authority. Authority agrees at its own expense to render advisory accounting service in the setting up and administering of such accounts.

"(c) To furnish promptly to Authority such operating and financial statements relating to electrical system operations.

"(d) To allow the duly authorized agents of Authority to have free access to all books and records relating to electric system operations.

"(e) To sell and distribute electrical energy to the ultimate consumer without discrimination between consumers of the same class. and no rate shall be charged or practice adopted which will grant a discriminatory rate, rebate or other special concession to any consumer served by Contractor. Contractor shall observe the principle that the [fol. 3550] sale of energy for industrial use shall be a secondary purpose, to be utilized principally to secure a sufficient high load factor and revenue to permit domestic and rural use at the lowest possible rates and in such manner as to encourage increased domestic and rural use of electricity."

The schedule further provides:

"Lower Rates to Other Municipalities—if at any time during the term of this agreement Authority should supply electricity to any municipality at a lower rate than that applicable to Contractor, and such lower rate shall not be justified by different conditions of service, making the cost to such other municipality relatively less than to Contractor, such lower rate shall be made available to Contractor.

"Developmental Surcharge.—Contractor agrees not to depart from the resale rates set forth in Schedule B (resale rates) without first securing the consent of Authority: Provided, however, that in order to maintain Contractor's rev-

enues in the developmental period in which the increased demand for power may not compensate for the greatly reduced rates provided for in Schedule B, Contractor may impose a surcharge upon those classes of consumers subject to a surcharge under the provisions of said Schedule. [fol. 3551] Contractor may initially determine and may from time to time vary such surcharge, with the understanding, however, that all revenues over those required for the appropriations set forth in Section 10 (a) herein shall be applied to the reduction or elimination of surcharges. Surcharges shall be based on a straight percentage of net bills, and shall apply uniformly to all members of classes as to which surcharges are authorized.

"Adjustment of Rates.—Should the cost of living index compiled by the Department of Labor show a decrease for six consecutive calendar months of 20 per cent or more under the index figures for the month in which this contract is signed, Contractor may in writing request Authority to agree to such a reduction in rates as the circumstances may warrant, and should such index figures show a 20 per cent or more increase for the same period, Authority may in writing request Contractor to agree to such an increase in rates as the circumstances may warrant. If within thirty days after the receipt of such a request the parties shall be unable to agree to a satisfactory adjustment, the question shall be submitted to three arbitrators, one to be appointed by each of the parties, and a third to be appointed by the two so selected. A decision of the arbitrators shall require only a majority vote, and [fol. 3552] such a decision shall be final and binding upon both parties.

"Disposition of Contractor's Revenues.—Contractor agrees to dispose of revenues from the operation of its municipal electric system in the following manner: (a) Revenues will first be used for operating expenses, after which, in the order named, revenues shall be made applicable to interest on electric system bonds and/or other indebtedness applicable to said electric system, amortization of such bonds, or other indebtedness, reasonable reserves for new construction and other contingencies, payment to the general fund of Contractor for taxes at rates equivalent to the taxes assessed against other property of

COMPLAINANTS' EXHIBIT No. 801 (Excluded)

a similar nature, and a return on Contractor's equity of not more than six per cent per annum. (b) After the appropriation of the above amounts the Contractor agrees that all remaining revenue shall be applied to reductions in the rates to consumers."

Tupelo is expected to use Muscle Shoals current on February 7, 1934, when Tupelo's contract with the Mississippi Power Company expires. The Authority will cooperate with Tupelo in encouraging a wider use of electricity, and plans an intensive demonstration in rural electrification in the heavily settled county of Lee of which Tupelo is the county seat.

TVA Press Release of November 19, 1933

Is Electric Power Important, by Arthur E. Morgan

I have seen references in the local press to a supposed statement of mine that electric power is an unimportant incident in the Tennessee Valley Authority program. May I express my opinion on the matter. The problem of electric power is extremely important in the program of the Tennessee Valley Authority, but it ought not to continue to be so. * * *

* * * * * * *

There are a number of fundamental needs of people which are matters of almost life and death if they are not supplied, but which ought to be supplied so freely that they seem unimportant. Air and water are such needs. A few others are roads for transportation; mail, telegraph and telephone for communication; and electric power. These fundamental needs of men are so fundamental and must be supplied on such a large organized scale that the sup-
[fol. 3554] plying of them is not a private affair but a concern of the public. It is the business of the public to supply such needs one by one until they are so well provided for that we need to think little about them, and can turn our minds to other matters.

COMPLAINANTS' EXHIBIT No. 802 (Excluded)

At present, the power issue is in the Tennessee Valley Authority region. Let us hope that in the next few years, it can become so thoroughly mastered that we need give it but little thought. Our power resources here are so abundant that an adequate supply of power for all our needs should be no more of a problem and a little more of tax than abundant and pure water supply is at present. In fact, in our rural regions, an abundant supply of power should be less difficult to secure in many cases than an abundant supply of pure water. The power program of the Tennessee Valley Authority is being worked out under the direction of Mr. Lilienthal. His aim is to bring about a time when power will no longer be an important matter to demand our time and attention, when an abundant supply will be available to all at a cost so low as not to tax the family budget. Whether that program does succeed, will depend, of course, on the cooperation of the Authority and the people of the territory.

[fol. 3555] COMPLAINANTS' EXHIBIT No. 803 (Excluded)

TVA Press Release of November 21, 1933

The Tennessee Valley Authority

Address to the National Academy of Sciences in Boston, by Arthur E. Morgan, Chairman of the Tennessee Valley Authority, November 20, 1933.

* * * * * * *

* * * The power program of the Tennessee Valley Authority has been worked out under the direction of David E. Lilienthal, a member of the Board, with vigor and dispatch, and I believe, in a masterful manner. The first contract for furnishing power to a municipality has recently been executed, and several hundred miles of transmission line will shortly be under construction.

* * * * * * *

Then there is the great waste in the electric power situation. Men have a few basic needs which must be supplied as

[fol. 3556] part of a civilized environment. One of these is an abundant supply of pure water. Other basic sources are transportation, communication and power. We shall steadily approach the time when these services are so cheaply and abundantly supplied that they fall into the background as requiring but little of our thought.

At the present time electric power is one of the live issues of social planning. Everyone is familiar with the disclosures of the Federal Trade Commission, of the widespread endeavor by secret and open propaganda to control the thinking of the nation on this issue. In a few cases where unusual indiscretion has opened the scene to the public, as in the case of the once very honorable Mr. Insull, we can see what the industry is like on the inside.

The Tennessee Valley Authority is interested in the electric power issue on several counts. First, if a case of public ownership and operation can be established, with fully open and comparable cost accounts and records, we may be provided with a "yardstick" by which we may discover what electric power actually ought to cost. The private utilities, if they are sincere in their expressed belief of the superiority of private ownership and operation, should welcome such an example.

[fol. 3557] It is not only the private utilities that will be provided with a "yardstick." Public ownership will be on trial. * * *

Another object of the TVA is to make this region and the country as a whole more fully aware of the vast possibilities of electric power for enlarging the freedom and scope of modern life in the home and on the farm. This can only come with cheap power, from which all speculation and exploitation have been removed. The electric power business is one of the simpler industries of our country. It does not compare in complexity with the shoe industry, the automobile industry or the railroad industry. No vast tribute should be paid for management and financing. Brought down to its simpler necessities, electric power should be a universal convenience, supplied as city water supplies usually are, on a basis of service and not of commercial exploitation.

Lastly, the economy of electric power in the Tennessee Valley area will depend much on large scale developments

that are designed and operated as single integrated systems. The entire Tennessee River System, with its thousands of miles of streams, should be under one control and ownership, which means Government ownership. An example will illustrate: all along the Tennessee River power plants can [fol. 3558] be installed with a total fall of about five hundred feet. But these are "run-of-the-river plants." That is, they provide little storage, and the water must be used as it flows. At Muscle Shoals, for instance, the capacity during high water in winter may be 600,000 kilowatts, whereas, the low water of a dry summer may generate only 40,000 kilowatts. The maximum capacity of high water is fifteen times the minimum capacity at low water. Yet it is only the "prime power," or power that is nearly always available, that has much value. Now, up river on one of the main branches of the Tennessee is a power project of another sort. A high dam will produce vast storage capacity, great enough, in fact, to store a year's supply of the stream. There has been a project on foot to build a great industrial plant at this upstream site, using the power for manufacturing purposes. The control of flow would be determined by the orders received by that one plant, and by its need for power. It might be using much power, and therefore releasing much water, during the high water of winter, when there is already a super-abundance of water in the river below. During the summer the plant might be shut down and water might be stored above when it is most needed below.

[fol. 3559] If the entire system should be owned and operated as one, the situation would be very different. The entire system would be inter-connected by transmission lines. During the high water of winter the upper plant would be shut down and the water stored in the reservoir. Abundant power would be available from the river plants below where no storage is available, and where the water must be used as it comes. Then, during the summer, when the river is low and electric power scarce and most valuable, the upper plant would be operated. Not only would a large amount of power be available there, if the whole year's storage were to be used in those months, but all the water used in the plant above would have to pass through each of the plants below, all the way to the mouth of the Tennessee. By such united operation probably twice as much "prime power"

COMPLAINANTS' EXHIBIT No. 803 (Excluded)

or dependable power could be generated for a given investment, or, in other words, the power would cost half as much per kilowatt hour.

Private utility men say that they would get the same result by trading power among themselves. That, however, does not answer the question. In the original installation of an up river power plant, the investment which is justified in providing storage will be determined by whether an income will be produced by the water which is released from the [fol. 3560] reservoir, as it goes through other power plants down the river. For instance, the Norris Dam now being built by the government on Clinch River is made higher and the reservoir is made larger than would be justified by the power possibilities for the dam itself. The Norris Dam plant will be worth more as a regulator for Muscle Shoals than for the power it could generate at its own plant treated independently. The water going through Norris Dam plant will be worth twice as much at the plants below as it is at its own plant. An investment justified by the whole system would not be justified for an independent plant.

Down stream from the Norris Dam is a private power development on the Tennessee River—the Hales Bar Dam and Power Plant. The value of that private plant will be doubled by the building of Norris Dam at public expense. Only by a single organized system of water power plants for the whole Tennessee River System can the full economy be realized. With that organization, water power may cost less than half what it would if the various units should be developed independently by private companies.

Water power is to have stiff competition from steam to Diesel engine. If the Tennessee River region is to realize its possibilities in water power it cannot afford to throw away this economy.

[fol. 3561] COMPLAINANTS' EXHIBIT No. 804 (Excluded)

TVA Press Release of November 22, 1933

Washington, Nov. 22.—Sheffield, Alabama, adjacent to the Muscle Shoals hydro-electric plant, gives every indication of being the second municipality to obtain TVA power, according to David E. Lilienthal, in charge of the Authority's electrification program.

COMPLAINANTS' EXHIBIT No. 804 (Excluded)

"An agreement between Sheffield and the Tennessee Valley Authority for the use of Muscle Shoals power will be entered into as soon as certain formalities are concluded," Director Lilienthal announced today. "It had been expected that the contract would have been signed by this Thursday, but the untimely death of Mr. T. Herbert Clegg, in charge of negotiations for the Authority, will mean a little delay."

Sheffield has applied to the Public Works Administration for a loan in order to finance its own distribution plant, to be built or acquired. The franchise of the Alabama Power Company in the city has expired.

"Sheffield is very anxious to secure this power from the Authority and is ready to do all in its power to close this matter as quickly as possible," declare Sheffield's Board of Commissioners in a formal letter to Director Lilienthal. Signed by W. H. Richardson, president, and [fol. 3562] Commissioners R. R. Hill and Hoyt Greer their statement continues:

"Messrs. Lide & Adler, engineers employed by the City to negotiate with you for the purchase of power from the Authority, have conferred with your engineers in the matter of the contract for the power. In all substantial provisions of the contract there was agreement between them and only a few minor details need to be corrected before the City will sign the contract offered. These matters are detail only and will not materially affect or change the contract offered."

The terms of the contract under consideration are of the same character as those in the contract signed on November 11, by the City of Tupelo, Mississippi. A lower wholesale rate prevails, since no transmission line is involved. Retail rates will be much lower than those now in effect.

TVA Press Release of December 5, 1933

The Tennessee Valley Authority and Electric Power, by Arthur E. Morgan

Chairman of the Tennessee Valley Authority. Address to the American Institute of Electrical Engineers (New York Section) at the Engineering Society's Building New York City, December 4, 1933, 8:00 P. M.

• • • • • • •

The Authority has in view a policy which would lead to great economy in hydroelectric power generation. Water power in the future may have very stiff competition from [fol. 3665] both steam and Diesel engines. Whether these three million kilowatts of potential water power in the Tennessee river system can be developed in competition with other sources of power will depend upon whether every possible economy is achieved in its development. If the cost of generating water power should be half a cent per kilowatt hour it may lose out before steam or the Diesel engine. If the cost of water power can be reduced

to a quarter of a cent per kilowatt hour it may have a relatively clear field.

Without suggesting any particular level of unit cost, I venture the opinion that if the water power development of the entire Tennessee river drainage area of 40,000 square miles can be given a single unified ownership and control, the unit cost of power may be no more than half of what it would be with divided ownership and management. Let me illustrate—

Near the East boundary of Tennessee is a dam site which will provide vast storage capacity for an area of very heavy rainfall and run-off of a few thousand square miles. From this point down the Tennessee River to its mouth is a fall of roughly one thousand feet, nearly all of which can be used for generating power. A plan has been proposed by [fol. 3566] a private company for generating power at the upper site with a dam perhaps 200 feet high, and to administer this power plant as an independent industrial undertaking, perhaps for the operation of a large manufacturing plant. If this is operated as an independent unit it will be regulated with a view to its own needs. In determining how much storage can be economically provided in the original construction, only the value of storage to that plant alone can be considered. The management cannot invest money in this upper plant on the ground that the investment would be justified in the use of stored water at each of the eight or ten plants down below, in which it has no financial interest. Some of these lower plants may not yet be built.

If there were only one up-river plant and one down river plant some arrangement might conceivably be worked out, but with eight or ten down-river plants which have little or no storage, and twenty or thirty up-river plants on half a dozen tributaries, each with storage which could be released, all prospect for voluntary unified and coordinated control fades away. Each plant would be run when its owner should choose, without regard to the abundance or deficiency of water at plants below or on other tributaries. Trading of water and even exchange of power, would become [fol. 3567] cumbersome and relatively ineffective.

Now consider what would be accomplished by a single unified system, thoroughly interconnected by transmission

lines and controlled from a single office. During wet seasons or wet years the storage dams would be closed until their reservoirs were filled, and all power would be developed from plants having no storage, or inadequate storage. If rains should be heavier on one tributary than on another, the full reservoirs would be drawn upon. If some reservoir had only enough capacity to store the flow for a few months, its supply might be used ahead of a reservoir that would store one or two years run-off. If during the low water of a summer a freshet should occur on an uncontrolled tributary, that freshed flow could be used to the utmost, and an equivalent value in stored water would be saved.

In any single reservoir it seldom pays to store water for more than two years in preparation for a dry cycle, but in a large system the exceptionally cheap reservoir space could be used for that purpose, thus giving additional security against extreme drouth.

On some of the smaller tributaries of the Tennessee sometimes at high elevations there are reservoir sites of very large capacity, but without water enough to fill them. [fol. 3568] These cheapest and most capacious sites could be developed by building dams, and then all surplus power could be used to pump water up hill into them from the Tennessee river. For off peak hours at night, for a few wet months during the year, and for intermittent wet seasons, all surplus power could be used in pumping water into these high reservoirs which would have power plants to be used during peak loads or for a standby supply.

With such a single integrated system under a single control, the full hydroelectric power possibilities could be realized, and the cost per unit of private power might be not more than a half or even a third of the cost of separately owned and operated plants. In this process navigation and flood control also would be provided for, with substantial contributions to the low water flow of the Ohio and the Mississippi.

I hold that such unified control and operation implies government ownership and operation. It may be argued that all this could be accomplished under private ownership and operation. But I hold that it should not be in private hands unless that should be necessary to avoid gross inefficiency and corruption of the spoils system.

COMPLAINANTS' EXHIBIT No. 806 (Excluded)

[fol. 3569] The control of this great electric power system by a private corporation would give economic power over the people of the region which no self-appointed men ought to hold. Such management and operation would of necessity be governmental and public in its nature, whether privately or publicly owned. It would be necessary to exercise the right of eminent domain, and to have control over the economic life blood of a vast region. Public regulatory bodies have not proved their ability to control such vast aggregations of economic power.

• • • • • • •

Just as an adverse balance of foreign trade tends to bankrupt a nation, so the constant drain from a municipality of payments to a foreign owned utility tends to economic impoverishment. Given administration of equal quality, the ideal status of a city utility is that it is fully amortized and is owned by the public it serves. Regional independence from a perpetual drain is no less important for an area as large as that of the Tennessee Valley Authority than for a city. In good economics only that should be imported which cannot reasonably well be produced at home. Absentee ownership of utilities is an unsound policy unless there are determining reasons for it. One of the purposes of the [fol. 3570] Tennessee Valley Authority to provide a case in public ownership and operation and to discover wherein lies the mysterious difficulty in utility operations. Since an important municipal system like that of Tacoma has not disclosed those difficulties, a trial on a larger scale seems desirable.

• • • • • • •

• • • We need a new psychology about electric power. We need to think of it as an ever present servant, practically unlimited in quantity and convenience. For ordinary purposes we should be able to practically forget its cost as we do water in the household. This should be especially true in the Tennessee Valley Authority, where a great surplus of intelligent and efficient labor is available to use a great supply of raw materials in the development of a well nigh limitless supply of power.

COMPLAINANTS' EXHIBIT No. 806 (Excluded)

The first restrained and modest steps toward these results are being taken by the Tennessee Valley Authority. The power program of the Authority is in the hands of Mr. David E. Lilienthal, one of the directors. Contracts have been made for furnishing electric current to one municipality in Mississippi, and two in Alabama. Various other requests have been received from those states and from Tennessee, Georgia and Kentucky. It is the hope of the Authority to so stimulate the use of electric power that its activities [fol. 3571] shall be a stimulus and not a deterrent to the whole industry. In setting rates, an effort has been made to include every legitimate item of cost, including interest, amortization and taxes. There is an honest effort to make costs genuinely comparable to those of private industry. The Authority is refraining from any campaign to take customers from private utilities. Prospective customers must take the initiative. Genuine effort is being made to disturb security holders as little as possible. Statements spread broadcast by the utilities themselves among the small holders of their securities during the consideration of the TVA bill in Congress, to the effect that if the Bill should pass the utilities would be ruined, have perhaps been believed by some persons. The Authority cannot, of course, be held responsible for the unfortunate results of the pessimistic forebodings of this propaganda of the private companies. The power program of the Tennessee Valley Authority is an effort in a limited area to bring about a cheap and ample supply of power on a self-supporting basis, as one of the several conditions necessary to an enlightened and wholesome economy in the region it is trying to serve.

TVA Press Release of December 12, 1933

The first crew of CWA workmen assigned to TVA Saturday began surveying and staking rural electrification lines in Lee county, Mississippi, of which Tupelo is the county seat, the Tennessee Valley Authority announced.

Tupelo was the first city to contract with the Authority for power from Wilson dam. An aggressive campaign is now

COMPLAINANTS' EXHIBIT No. 807 (Excluded)

being waged in Tupelo and Lee county to increase the use of electricity, particularly by farm families.

As soon as labor crews can be assembled, electric lines will be extended in four other Mississippi Counties, according to Guy W. Thaxton, TVA engineer in charge of development work in Northern Mississippi.

Rural lines in these counties will be constructed as rapidly as the projects can be set up and approved by Greek L. Rice, Chairman of the Civil Works Administration for Mississippi.

John L. Neely, Jr., TVA-CWA coordinator, will confer with Mr. Rice Tuesday in Jackson, Miss., relative to these projects. On Monday Mr. Neely will discuss similar matters with Algernon Blair, CWA chairman for Alabama, in Montgomery.

[fol. 3573] While the routes are being surveyed and staked, CWA workers are cutting the poles, digging holes in which to set them, and making ready to string the wires. Most of the new lines run along county road rights-of-way and penetrate areas heretofore without electricity.

[fol. 3574] COMPLAINANTS' EXHIBIT No. 808 (Excluded)

TVA Press Release of December 18, 1933

The Tennessee Valley Authority has decided that development of the Aurora Dam on the Tennessee river should be a part of the Authority's plan for an integrated power program embracing the entire Tennessee river basin. This decision has been forwarded to private interests which sought control of the Aurora dam site.

The Aurora project is located in Kentucky approximately 44 miles up stream from the confluence of the Tennessee and Ohio rivers at Paducah, Kentucky.

"From an engineering standpoint Aurora dam is being studied by the Authority to determine whether it should not be one of its next projects," Chairman Arthur E. Morgan said. "The Tennessee Valley Authority, however, does not feel justified in starting another project with its present funds. We have only enough to finish one job and make a good start on Wheeler dam.

COMPLAINANTS' EXHIBIT No. 808 (Excluded)

"The value of a power dam is roughly the value of the least amount of power which that project can produce. For example, during the high water season there would be little or no power at Aurora dam because the Ohio river is so [fol. 3575] high that it backs up nearly to what would be the top of the dam. On the other hand, Muscle Shoals in high water has a great excess of power. The two units and Norris Dam supplement each other. For the Tennessee Valley Authority to have an effective unit of power, it should control both Muscle Shoals and Aurora Dams. Operated as a single private unit Aurora dam would have much less value because it would have little, if any, 'prime' power, or power which is available without interruption during high or low water."

[fol. 3576] COMPLAINANTS' EXHIBIT No. 809 (Excluded)

TVA Press Release of December 20, 1933

Sixty men have started constructing the 17-mile transmission line that will carry power from Wilson dam, Muscle Shoals, Ala., to the site of the new Joe Wheeler dam, the Tennessee Valley Authority announced today.

Work at present consists of clearing the right-of-way and digging holes for poles. It is planned to complete the line by January 1, 1934, and begin furnishing Wilson dam power for construction of the Wheeler dam.

Terminal connections already have been made at the Wilson dam sub-station for the line which, after completion of Wheeler dam, will serve as an auxiliary tie transmission line between the two dams. It will also be used as a feeder for rural electrification lines along its route.

Simultaneously, the Authority announced that CWA workmen, directed by TVA engineers, are making rapid progress in extending rural electrification lines in Northern Alabama and Mississippi. In Lauderdale county, Alabama, 74 CWA men are at work, while in Alcorn county, Mississippi, 30 men are employed in erecting county lines.

[fol. 3577] In addition, many farmers are using their spare time to cut poles and dig holes so as to be ready to

COMPLAINANTS' EXHIBIT No. 809 (Excluded)

cut in on the Tupelo, Miss., transmission line when the Authority begins delivering current there February 7, 1934.

Intense interest is being shown by farmers of Lee County, of which Tupelo is the county seat. They have formed a county-wide organization, with active units in each of the county's 26 school districts, and a membership of 2,000. Efforts to increase the use of electricity in the county seem certain of success due to the splendid voluntary response of the people to the Authority's program.

[fol. 3578] COMPLAINANTS' EXHIBIT No. 810 (Excluded)

TVA Press Release, of December 20, 1933

The creation of Electric Home and Farm Authority by order of President Roosevelt is the outgrowth of negotiations instituted two months ago by the Tennessee Valley Authority with the Electric manufacturers of the country, and with the principal electric utilities operating in the Tennessee Valley area.

The next step in the development of the cooperative program is being worked out in conferences in New York the balance of this week between a special committee representing the National Electric Manufacturers Association, and Director David E. Lilienthal and General Solicitor William A. Sutherland representing the Authority.

* * * * * * *

In a statement today Director Lilienthal, in charge of the Authority's power program, said:

"The home or the farm of the family of modest income has never had the benefit of a general use of electricity. [fol. 3579] In the Tennessee Valley, although there are vast sources of power available, the people have had to use electricity sparingly. Two barriers have prevented a full enjoyment of the benefits of this great natural resource: prohibitive rates for energy, and the high cost of electric appliances. Electric Home and Farm Authority plans to remove those barriers in the Tennessee Valley.

COMPLAINANTS' EXHIBIT No. 810 (Excluded)

"The consuming public has been suffering from an impasse which the electric industry has been unable or has lacked the leadership to break. The prevailing high rates for electricity has stood in the way of a more general use of electric appliances. In turn, the high cost of appliances has prevented a greater use of electricity, which would mean lower rates. Thus, the electric utilities and the appliance manufacturers have been standing in their own and in each other's light. In this situation government leadership is essential. The agency set up by the President in the Tennessee Valley states, if it receives the wholehearted cooperation of all interests, can break this 'vicious circle', and, with injury to no one, reduce the cost of electricity and electrical appliances both, thereby bringing the comforts and conveniences of electricity into many homes."

[fol. 3580] COMPLAINANTS' EXHIBIT No. 811 (Excluded)

TVA Press Release of December 20, 1933

David E. Lilienthal, Director of the Tennessee Valley Authority in charge of its power program, tonight issued the following statement in explanation of the purposes of the Electric Home and Farm Authority, Inc., just created by Executive Order of President Roosevelt.

"The objective of this program is a wider and greatly increased use of electricity in the homes and on the farms in the seven states of the Tennessee Valley. In order to carry out the program there must be a broad scale distribution of very low cost standard quality electric using appliances and concurrently a revision downward of electric rates. The new agency is based on a cooperative program in which the federal government, the electric utilities both publicly and privately owned, the electric manufacturing industry and dealers will participate through the Electric Home and Farm Authority, Inc.

"It is proposed that the federal government participate in this program in the following ways:

"1 By assisting in financing the consumer in purchasing [fol. 3581] standard electric equipment at very low prices.

COMPLAINANTS' EXHIBIT No. 811 (Excluded)

"2. By securing reductions in electric rates by agreement with the utilities publicly and privately owned so as to make use of this equipment feasible for the average householder and farmer.

"3. By engaging in educational work and research to further lower the cost of electric equipment and to make it better adapted to the needs of the average home and farm.

"Electric appliances are now sold by regular dealers for the manufacturers, by hardware and department stores, and by electric utilities. The program does not contemplate a disruption of these outlets. Each dealer will, of course, continue to exhibit and sell any lines of electric appliances he desires but he will also have an opportunity to sell the low-priced appliances which this program is expected to create. The program will stimulate the dealers' general business.

TVA Press Release of December 28, 1933

Organization of farmers of six northeast Mississippi Counties into rural electric power associations, to buy current at wholesale from the Tennessee Valley Authority, will be conducted by the agricultural extension service of Mississippi State College, Starkville, it was announced today by the TVA.

. . . . . .

Rural electric transmission lines are now being built in Mississippi, CWA funds being used for labor and TVA money for the purchase of poles, transformers, wire and other transmission line equipment. The county associations, incorporated under Mississippi laws, will retail TVA power to their members on a no-profit basis. Resale rates, however, will provide for repayment of the Authority's cash outlay in constructing the lines.

. . . . . .

COMPLAINANTS' EXHIBIT No. 812 (Excluded)

A similar plan for rural electrification is being worked out by the Tennessee Valley Authority in several north west Alabama counties as rapidly as the proper cooperation can be obtained.

[fol. 3583] COMPLAINANTS' EXHIBIT No. 813 (Excluded)

TVA Press Release of January 5, 1934

The Tennessee Valley Authority and Alabama Power Company, Tennessee Electric Power Company, Mississippi Power Company and Georgia Power Company today entered into a comprehensive agreement, after extensive negotiations extending over the past three months, under which the Tennessee Valley Authority acquires electric facilities in a substantial territory in three states in which to conduct its power operations. Under the agreement the President's power "yardstick" is set up in initial form, and immediate Muscle Shoals power service is provided to householders and farmers in the Tennessee Valley. Six months after the creation of the Valley Authority a market has been provided for all the power resources of Muscle Shoals, after a dozen years of plant idleness.

The contract, which will terminate as soon as power is available from Norris Dam, contains the following major provisions:

1. Purchase by the Authority of approximately $3,000,000 of property from the Alabama Power Company, Mississippi Power Company and Tennessee Electric Power Company, by which the Authority obtains immediate urban and rural markets in Mississippi, Tennessee and Alabama.

[fol. 3584] 2. Sale of municipal systems in the Mississippi counties affected to the Authority.

3. Sale of municipal systems in the Alabama counties affected to the municipalities by the Alabama Power Company.

4. Option is granted the Authority to purchase municipal systems in Tennessee counties affected.

5. An agreement to reduce electric rates by the Tennessee Electric Power Company to the level recently established by the Georgia Power Company.

* * * * * * *

COMPLAINANTS' EXHIBIT No. 813 (Excluded)

"The size of the area which the Authority determined to acquire, was determined in a large measure by the amount of power it now has available, that is, by the existing firm power capacity of the Muscle Shoals plant. Until further power is available to the Authority by the completion of Norris Dam (estimated to be ready in three years) only those communities could be served which in the aggregate would not exceed in their power demands our capacity to furnish immediate and continuous electric energy. The area ceded by this contract, together with the city of Knoxville, which recently voted to become a wholesale purchaser of Muscle Shoals power, added to the require-[fol. 3585] ments of rural electrification projects now under way, and demands in territory outside the ceded area, will absorb virtually all of the power which Muscle Shoals can produce, allowing a safe margin for increased use of electricity which the Authority's low cost appliance program is certain to induce. The precise boundaries of the area chosen were determined by the physical location and sizes of existing transmission centers."

* * * * * * *

"The contract carries forward one of the Authority's objectives of effectuating lower rates to all consumers in the Tennessee Valley area. Rate reductions of a substantial character have been announced recently in Alabama and Georgia on the properties of the companies parties to this arrangement. As part of this contract the utilities further agreed with the Authority to reduce rates throughout their territory in the State of Tennessee. These new rates represent a reduction of 28 per cent under the 'inducement' rate and 15 per cent under the 'immediate' rate, with a total saving to householders of $415,000 annually."

* * * * * * *

[fol. 3586] Reductions in Rates.—The Tennessee Electric Power Company agrees to reduce the domestic electric rates to the level recently established by the Georgia Power Company. These rates will result in a reduction of $415,000 in bills for domestic service in all territory served by the Tennessee Electric Power Company.

[fol. 3587] COMPLAINANTS' EXHIBIT No. 814 (Excluded)

TVA Press Release—Undated.

Under the contract between the Tennessee Valley Authority and the Commonwealth and Southern Corporation of January 4, the Authority will acquire all of the transmission and distribution facilities of the Mississippi Power Company in the following counties in Mississippi: Pontotoc, Lee, Itawamba, Union, Benton, Tippah, Prentiss, Tishomingo and Alcorn. The Authority will be in position to serve all towns and communities in this territory. In addition, the Authority has the right to serve all rural customers and rural consumer organizations in Monroe County not now served by Mississippi Power Company. The Authority has the right to contract with other municipal consumers outside of these counties which are not now customers of the Mississippi Power Company.

In the state of Alabama, the Authority will acquire all of the property, excepting municipal distribution systems, of the Alabama Power Company in the counties of Lauderdale, Colbert, Lawrence, Limestone, Morgan, the northern half of Franklin and some of the northern part of Cullman. The Authority will be able to serve such municipalities in these counties as construct or acquire their own distribu-[fol. 3588] tion systems. In the event that municipalities fail to construct or acquire distribution systems, the Authority will serve the Alabama Power Company which will operate municipal distribution systems. However, the Alabama Power Company has agreed to make every effort to agree with municipalities on a price at which to sell the municipal distribution systems. In no event will the negotiations and transfer pursuant to the contract cause any discontinuity or interruption of service to users of electricity.

In the state of Tennessee, the Authority will acquire properties of the Tennessee Electric Power Company, excluding distribution systems, in the counties of Anderson, Campbell, Morgan, Scott, and the west part of Claiborne. The Authority has the right to serve rural customers and rural consumer organizations in the counties of Rhea, Roane, Meigs and the western part of McMinn which are not now customers of the Tennessee Electric Power Company.

COMPLAINANTS' EXHIBIT No. 814 (Excluded)

In general, the Authority retains its right to sell electric energy to any and all municipalities not only within the territory acquired by it, provided that such municipalities [fol. 3589] are not at present served by any company in Commonwealth and Southern Systems, but also all other municipalities, without restriction as to territory, so long as such municipalities are not now served by one of the following companies: Alabama Power Company, Tennessee Electric Power Company, Mississippi Power Company and Georgia Power Company.

In addition to the above, the contract provides for intertie connections to supply up to 25,000 kilowatt capacity for rural and industrial use outside of the contract territory to customers not now served by the power companies above named.

TVA Press Release of January 6, 1934

Business and Government in the Tennessee Valley

Text of Paper by David E. Lilienthal, Director and General Counsel, Tennessee Valley Authority Read Before American Academy of Political and Social Science in Philadelphia, Penn., January 5, 1934

* * * * * * *

The public utility business has long borne a different relationship to government from other businesses not so peculiarly affected with a public interest. The whole community relies so completely upon public utility service that for generations the government has found it necessary and appropriate to regulate the rates and services of these quasi-public agencies. During the past quarter of a century, the regulation of public utilities has been vested in state commissions. Through these commissions the force of government was exerted upon public utilities to the end that [fol. 3591] the rates charged consumers should be reasonable, and that financial practices injurious to the consumers and to the public investors should be prevented.

COMPLAINANTS' EXHIBIT No. 815 (Excluded)

There has been a growing feeling that this method of expressing the regulatory relation of the government to the public utility business was inadequate to meet the needs of the situation. These critics insisted that commission regulation, by and large, had been ineffective; that in many states instead of the regulators regulating the utilities, the utilities were regulating the regulators; that financial abuses of the most lurid sort had taken place despite regulation; that the processes of regulation were too slow; and that the great technological savings in the field of electricity had not been passed on to the consumers.

The power policy written into the Tennessee Valley Authority Act represents an attempt to regulate public utilities not by quasi-judicial commissions, but by competition. The Act definitely puts the Federal government into the business of rendering electric service. The Authority is required to acquire a market, to set up an area in which to conduct its operations. The results of these operations in this limited area are intended to serve as a "yard-stick" by which to measure the fairness of the rates of private utili- [fol. 3592] ties, and to prevent destructive financial practices by private utilities. In carrying out this competitive relation between the Federal government and the private business of electricity, the wastes of competition are to be eliminated, and the regulatory function of competition emphasized. In other words, duplication of facilities and competition in the same community is to be avoided. There is not time to discuss in detail the principles which the Authority has adopted to govern its operations in this new relation as a competitor of a public business. Those principles have been set out by the Authority in its Power Policy, and have been discussed in some detail in various public statements.

* * * * * * *

In common with other recently created agencies of government, the Tennessee Valley Authority has a definite duty and a definite role to play in this new function of government as a stimulating and coordinating force. There are a number of illustrations in the work of the Tennessee Valley Authority of this need of government stimulation. The most recent, and perhaps the best illustration, is afforded by the

creation a few days ago, by order of President Roosevelt, of a subsidiary of the Tennessee Valley Authority, a Delaware [fol. 3593] corporation known as Electric Home and Farm Authority. The occasion for the creation of this agency and a brief analysis of its functions will show how the government can act as a stimulator and coordinator in its relation to business.

In the Tennessee Valley there are great actual and potential sources of electricity. Private and publicly-owned agencies now have developed generating capacity from thirty to forty per cent in excess of existing requirements. Additional generating capacity is being developed with public funds. The same situation is true throughout the country. The people need and want this electricity in their homes, on their farms, and in their places of business, but as a matter of fact the use of electricity in the United States has been extremely limited. The average domestic consumer throughout the United States uses about 50 kwh. of energy a month, a niggardly and parsimonious use of a great resource.

Two barriers have stood in the way of a widespread use of this liberating force. The first and most important barrier is the rates charged for electricity. These rates have been too high to permit of the general use of electricity. As a result the use of electricity has been restricted and has never, except in unusual communities, reached the proportions [fol. 3594] justified by the universal need and effective demand for this service.

The electric power industry has consistently stated that if the consumers would use more electricity the rates could be greatly decreased. One leader among the utility executives, for example, pointed out recently that his most profitable customers were those who, with an extensive use, are charged a rate of less than 1.7 cents per kwh. as compared with the average user's rate of 4½ cents per kwh. and the small users' rate of 8 cents per kwh. Increase in use is essential to bring down unit costs. And yet to increase the use, the rates to the consumers must be decreased.

Not only the high cost of electricity, but the relatively high cost of electric-using appliances has constituted a serious

barrier to the increased use of electricity. The labor and material costs of electric appliances have always been but a fraction of the total retail price. Volume production could have brought greatly decreased prices to the ultimate consumer, but with electric rates on a luxury basis, volume production of electric appliances in this field has never been accomplished.

Here we have a picture of a complete business stalemate. [fol. 3595] The electric utilities' position is that until the use of electricity is greatly increased, the rates cannot be drastically decreased. Nor will the use of electricity be greatly increased, they urge, unless electric-using appliances come into general use. The general use of electric appliances on the basis of present prices is concededly impossible. The electric appliance manufacturers, on the other hand, say that unless electric rates come down, volume production of electric appliances is impossible, and without volume production of electric appliances the per unit cost of manufacture and distribution cannot be substantially reduced. Electric utilities, electric manufacturers, and consumers all suffer from this vicious circle: the electric utilities, because they have great excess capacity which is idle and against which fixed charges are continuing to pile up; the electric manufacturers, because they have idle capacity on which overhead continues to be incurred. Here was an opportunity for government, represented by the Tennessee Valley Authority, to exercise its catalytic function.

By Executive Order, the agency known as Electric Home and Farm Authority was created to cooperate with business in an effort to break this impasse and to bring the benefits of a wide use of electricity at low cost to consumers through- [fol. 3596] out the seven Tennessee Valley States. Electric Home and Farm Authority was created to remove these barriers to a wide use of electricity and to a more stable and prosperous business for the electric manufacturers and the utilities. The plan, in brief, is as follows: the manufacturers of electric equipment have indicated their willingness to participate in a program of producing certain types of standard quality, low-cost electric-using appliances. These will be offered for sale by the existing dealer outlets, at prices very substantially lower than any heretofore known. These manufacturers will cooperate with Electric Home and

COMPLAINANTS' EXHIBIT No. 815 (Excluded)

Farm Authority in certain research and educational activities designed to bring home to people of the area the most economical and most satisfactory ways of using electricity in the home and on the farm. Further, Electric Home and Farm Authority will arrange for a more satisfactory basis for the financing of electric appliances. While the Reconstruction Finance Corporation will, in effect, guarantee ten million dollars of consumer paper, we are confident that the actual credit will come through the commercial banking system, which has been looking for just such high type of consumer paper, consistent with the needs for liquidity. The cost of financing to the consumer will be greatly reduced, [fol. 3597] due in considerable part to a cooperative arrangement whereby collections will be made by the utility company on the consumer's electric bill rather than through a separate and duplicating medium.

Negotiations are being carried on with electric companies operating in the area, looking toward a reduction in electric rates which will make it feasible for people of average and low income to use these electric appliances. Evidences of cooperation in this direction on the part of power companies have been most reassuring. They foresee that if this program is successful, there will be a great increase in the use of electricity, which will make for lower unit costs. The Tennessee Valley Authority, within the sphere of its own power operations, is setting rates for domestic and rural service which we believe will demonstrate not only the social desirability but the business wisdom of radically reduced electric rates. With those reductions in electric rates, one of the principal barriers to the use of electric appliances will be removed, and general, widespread use of electricity will become feasible.

[fol. 3598] COMPLAINANTS' EXHIBIT 816 (Excluded)

TVA Press Release—Undated

Washington, D. C., January 20, 1934.—Organization of the President's new Electric Home and Farm Authority, Inc., was effected late yesterday at a meeting of the incorporators at the Washington offices of the Tennessee Valley Authority at which time these officers were elected: David

E. Lilienthal, general counsel of the Tennessee Valley Authority and director in charge of the TVA power program, president; Arthur E. Morgan, chairman of the TVA, vice president; Francis J. Carr, controller of the TVA, treasurer; Dr. Harcourt A. Morgan, a director of the TVA, secretary, and William A. Sutherland, solicitor of the TVA, counsel.

Pursuant to the Executive Order of December 19, 1933, which authorized the Electric Home and Farm Authority, the directors of the Tennessee Valley Authority are also directors of the new body—the Messrs. Morgan and Lilienthal.

The Board of directors of the Electric Home and Farm Authority authorized issuance of 10,000 shares of capital [fol. 3599] stock of the new corporation, with a par value of $100 per share, as provided in the Executive Order, and also authorized execution of a contract with the Reconstruction Finance Corporation looking to the setting up of $10,000,000 of credit in connection with the Tennessee Valley electrification program.

The papers of incorporation, filed in Delaware, provide a life of seven years for the Electric Home and Farm Authority and list among the new corporation's objects and duties the following:

"To advance the general economic welfare of the nation by developing and fostering the increased use of electrical power through the reduction of the cost thereof to the consumer and through the reduction of the cost and price of electrical equipment and appliances; to aid in the distribution of electric appliances and equipment by financing the purchase thereof through the lending and advancing of money, extending of credit and guaranteeing of obligations of individuals, firms, corporations and others, upon the security of mortgages or other liens upon or claims against electrical appliances and equipment, and in general to carry on in connection with such financing a chattel mortgage-loan business; to cooperate with any Federal agency or branch of the Federal Government, or with any of the several States, [fol. 3600] or subdivisions or agencies of such states, or with cooperative or other organizations, or with private corporations or associations, and to make such studies, experi-

ments or demonstrations as may be necessary and suitable to advance and foster an orderly and proper physical, economic and social development in any of the several states by means of the use of electricity or electrical power; to make such surveys and general plans for the use of electricity and electrical appliances and equipment as may be useful to Congress and to the several States in guiding and controlling the extent, sequence, and nature of development which may be equitably and economically advanced through the expenditure of public funds or through the guidance or control of public authority; to perform any and all functions, and exercise any and all powers which may be duly delegated to it under and pursuant to the National Industrial Recovery Act, approved June 16, 1933, and any amendment or amendments hereafter made to said Act.

"To manufacture, buy, sell, deal in, and to engage in, conduct and carry on the business of manufacturing, buying, selling and dealing in electrical appliances and equipment and in goods, wares and merchandise of every class and description necessary or useful for the operations of the Corporation."

[fol. 3601] COMPLAINANTS' EXHIBIT No. 817 (Excluded)

TVA Press Release of January 20, 1934

"The Electrification of the American Home"

(Address by David E. Lilienthal, Director and General Counsel of the Tennessee Valley Authority to be Delivered over the Columbia Broadcasting System, National Radio Net Work from Station WJSV, Washington, D. C., on Saturday, January 20, Starting at 2:30 P. M. E. S. T.)

I want to talk to you this afternoon about that which I suppose is closest to the heart of every man and woman—the home. I want to tell you of some of the things which your Federal Government is doing in the field of electricity to make your home more convenient and more comfortable; what it is doing to lighten the labors of the millions of women who have the responsibility of guiding and caring [fol. 3602] for the home. More specifically, I shall speak

of the work the Tennessee Valley Authority is doing to electrify the American home.

It was six months ago, as many of you will recall, that upon the urgent recommendation of President Roosevelt, Congress created a publicly owned corporation known as the Tennessee Valley Authority. To this new agency many duties and powers were given. To it was transferred the famous government-owned hydro-electric plant at Muscle Shoals. One of the Tennessee Valley Authority's principal duties was to extend and broaden the use of electricity in the homes and on the farms, particularly in the seven states of the Tennessee Valley. By experiments and demonstrations, the Authority was to act as a spur in hastening the time when electricity would be widely and generously used in making every home more comfortable and convenient.

The Tennessee Valley Authority is now employing thousands of men, and spending millions of dollars in the construction of two great power dams and a 230 mile electric transmission line. But what we are constantly keeping in mind in this electricity program is not dams, or generators, or lines, but the every-day needs and desires of the men, [fol. 3603] women and children of the Tennessee Valley Authority. We have devised practical ways and means to make electricity available at rates so low as to be within the most modest budget. With the approval and support of President Roosevelt a plan has just been worked out which will make it possible for most housewives in the Tennessee Valley to have in their homes many of the labor saving electric appliances, and thus to enjoy the comforts and conveniences which electricity brings.

* * * * * * *

We all know what a transformation was wrought in the American home when the electric bulb replaced the kerosene lamp. Many of you who are home makers know what this has meant in increased convenience, comfort and safety, and in relieving women of tiresome duties. Twenty million housewives now have electric lights in their homes, but only a small percentage of these have the other equally important advantages which electricity brings. Only a few have the advantage of electric cooking and of electrically

heated water; relatively few enjoy the benefits of such other mechanical aids to the housewife as electric refrigeration.

The housewives of the country use an amazingly small quantity of electricity. The average use of electricity by [fol. 3604] the domestic user for the country as a whole is only about 50 kilowatt hours a month. This means that electricity in the home is still limited principally to lighting. It means that the average home is still barred from the almost limitless advantages of this great national resource. There is no sound reason why this condition should exist. It is part of the job of the Tennessee Valley Authority to see that this condition should not continue.

There is no scarcity of a supply of electricity. The sources of electricity are abundant. We are convinced that the principal barrier to a wider use of electricity by the American housewife is the rates which are charged for electricity. We believe that, before the American home can be electrified, the rates charged in the country generally must be substantially and drastically reduced. And we believe further, that such reductions in rates will so greatly increase the sale of electricity that these reductions will be beneficial to the electric business.

Drastically lower rates for electric service is the first step toward a wider use of electricity. The Tennessee Valley Authority is proceeding to put such substantially lower rates into effect in the area in which it is to distribute [fol. 3605] Muscle Shoals Electricity. These rates proposed by the Authority are based upon a consideration of all costs, including taxes, and will, we believe, justify themselves on a business basis. The Authority's electric rates carry a maximum charge of 3 cents per kilowatt hour, and, for the general user, an average of less than 2 cents per kilowatt hour. For example, a home using 300 kilowatt hours, or six times the national average use, a month, would be charged $5.50 per month. This expenditure of $5.50 would ordinarily cover the use of lights, electric refrigerator, electric range, vacuum sweeper, washing machine, toaster, percolator, iron, radio, and other miscellaneous electric appliances.

In addition to rate reductions to those housewives who are served directly or indirectly with Muscle Shoals Electricity, the Tennessee Valley Authority has recently been able to induce privately owned utilities, operating in the

area to make very substantial rate reductions to their consumers.

We realize, of course, that low rates for electricity alone will not accomplish the goal of an electrified home. Electric appliances must be used. At the present prices and terms of these appliances, thousands upon thousands of families [fol. 3606] of modest income are unable to take advantage of these low rates for electricity. To meet this situation the Tennessee Valley Authority, with the cooperation of the great electric manufacturing industry, is working out a plan whereby standard, high quality electric appliances will be available at prices much below those now charged, and the early installation of such equipment into thousands of homes made feasible. On December 19th, President Roosevelt issued an executive order creating an agency through which the Tennessee Valley Authority will carry this appliance program forward. It is called: Electric Home and Farm Authority, and its articles of incorporation were filed today. At present the corporation has funds to operate only in the seven Tennessee Valley states.

The future possibilities for use of electricity in the home are almost limitless. The Tennessee Valley Authority's program has already stimulated the inventive genius and practical resourcefulness of electrical engineers. The designing rooms and experimental laboratories of the manufacturers are now humming with activity. Almost unbelievable advances in the electric home equipment are being made and may be ready for announcement in the coming [fol. 3607] month. This remarkable progress is the best possible news to housewives, and to everyone who enjoys a comfortable place to live.

Briefly, this is the way the plan will work:

Mrs. Jones who, let us say, lives in a town in Tennessee, will go to the store of a dealer in electric appliances in her home town. There she will see on display, not only the dealer's regular line of refrigerators, ranges, etc., but also a standard model, bearing the trademark of a recognized manufacturer, and also the mark of approval of the Tennessee Valley Authority. This refrigerator, or water heater, or range, will be priced very much lower than has heretofore been the case for even the least expensive of standard equip-

ment of that kind. She will order one of the special refrigerators, let us say, and her husband will sign the proper papers. If his credit is acceptable, a delivery will be made immediately and the dealer will be paid in cash by the Electric Home & Farm Authority. Each month, over a period, there will appear on the Jones Electric bill an item in partial payment for the equipment which has been purchased. The plan will not be made available in any town in which the electric utility has not revised its rate to meet the require-
[fol. 3608] ments of Electric Home & Farm Authority.

Some years ago, when Franklin Roosevelt was a candidate for Governor of New York, he urged strenuously the importance of lower rates and power development which would make possible a wider use of electricity in the home. His opponents tried to poke fun at this program, by saying that Roosevelt wanted to put a waffle iron in every farm house. The women of Upstate New York saw nothing funny about the program at all, and voted accordingly. An attempt is now being made to ridicule the Tennessee Valley Authority's program of electrified homes, strongly reminiscent of that used in attempting to defeat Franklin Roosevelt's program in New York. We believe that the women of the Tennessee Valley will respond to the Authority's program, now sponsored by President Roosevelt, just as did the women of New York State in the case of Governor Roosevelt. Electric appliances are just as appropriate in the humble household as in the home of wealth. A love of home and a pride in that home is, by no means, a special possession of any group.

We have been talking thus far about increasing the use of electricity in homes in which electric service is already
[fol. 3609] available. A further point in the Tennessee Valley Authority's program is to bring electric service to homes which heretofore have never had it at all. This is particularly the case with the farm home. The number of farms which have electric service in the Tennessee Valley and in the United States generally, is shockingly small. The Tennessee Valley Authority is definitely committed to an extensive program of rural electrification. The other day, on a country road in Northern Alabama, I watched a crew set poles for the first farm line ever constructed by the United States Government. This line will bring electric service to

COMPLAINANTS' EXHIBIT No. 817 (Excluded)

farmers in that area who have for years desired service, and who have adequate income to justify such service. Similar lines are being constructed in about 18 counties in Mississippi and Alabama, and others are planned in Tennessee.

The Tennessee Valley Authority from its offices at Muscle Shoals, Alabama, or Knoxville, Tennessee, will be glad to supply information, or answer inquiries not only from the Tennessee Valley area, but in any part of the country, concerning the Federal Government's plan, of bringing about a more comfortable and convenient home—through the use of the great national resource of electricity.

[fol. 3610] COMPLAINANTS' EXHIBIT No. 818 (Excluded)

TVA Press Release of January 26, 1934

TVA Electricity delivered over lines acquired from the Mississippi Power Company will light the homes and turn the wheels of industry in the city of Tupelo, Mississippi, beginning at one minute after midnight of February 7. When the switch is thrown turning electric energy from the Government owned plant at Muscle Shoals into the distribution lines of Tupelo, the program of the Tennessee Valley Authority of setting up a "yardstick" will be formally launched.

* * * * * * *

Tupelo is but one of a number of cities and towns in the ten counties of Northeast Mississippi which will likewise be supplied with TVA power at Government "yardstick" rates. * * *

* * * The Tennessee Valley Authority is also at work building hundreds of miles of rural transmission lines which will serve the rural population in a large part of these ten counties acquired in Mississippi. More than sixty miles of rural transmission line has been completed and as soon as arrangements can be made for the distribution of TVA [fol. 3611] power, these communities likewise will have the benefit of electric service which has heretofore not been available, and the low rates, which is a part of the TVA program.

COMPLAINANTS' EXHIBIT No. 818 (Excluded)

In the territory in Northwest Alabama which has been turned over to the Tennessee Valley Authority by the Alabama Power Company, engineers of the Authority are making extensive studies with a view of aiding the various municipalities in the area in effecting satisfactory negotiations, if possible, with the Alabama Power Company for the acquisition of municipal distribution systems. Every effort will be made by the Authority, according to a statement made today, to speed up the completion of necessary arrangements for furnishing TVA power to the communities in the area. As in Mississippi, the Tennessee Valley Authority is engaged in the construction of rural transmission lines in Lauderdale County. Plans are well under way for the extension of these rural lines into other counties in the Alabama area.

[fol. 3612] COMPLAINANTS' EXHIBIT No. 819 (Excluded)

TVA Press Release of March 3, 1934

Following an all-day conference between representatives of the City of Knoxville, Tenn.; C. E. Groesbeck, Chairman of the Board of the Electric Bond and Share Co., owners of the Knoxville Electric System, and David E. Lilienthal, representing the Tennessee Valley Authority, the following statement as to the results of the conference was issued tonight by representatives of the city:

"We made a definite offer to buy the existing electric distributing facilities within the City of Knoxville at a price fixed as fair by an exhaustive engineering survey. The price offered for the purchase of the Knoxville Electric System was not acceptable to the owners of that property. We have exhausted every possible means of purchasing this property at a fair price. The city of Knoxville, being unable to purchase the existing plant, now has no alternative but to proceed immediately with the construction of its own plant with funds loaned for that purpose by the Public Works Administration."

Mr. Lilienthal's statement follows:

[fol. 3613] "I indicated to the conference that I would recommend to the Board of Directors of the Tennessee

COMPLAINANTS' EXHIBIT No. 819 (Excluded)

Valley Authority that the Tennessee Valley Authority purchase transmission facilities and rural and semi-urban facilities owned by the company serving Knoxville lying within Knox County and the adjoining area, at a fair price to be determined under accepted engineering practice. This offer was made in an effort to make easier the problems of transfer, by purchase, of the properties within the City of Knoxville. This offer, when combined with -he offer of the city, was not accepted."

The conference was attended by Mayor John T. O'Connor, City Manager W. W. Wynatt, Councilman W. A. Cochran, Chairman power committee; Charlton Evans, W. N. Smithson and W. H. Peters, Jr., Representing the Electric Bond and Share Co., and its subsidiary, the Tennessee Public Service Co., were C. E. Groesbeck, chairman of the board of directors, and MacGregor Smith, vice-president and manager of the New Orleans subsidiary of the Electric Bond and Share Co., and representing the Tennessee Valley Authority, David E. Lilienthal, member of the Board of Directors.

[fol. 3614] COMPLAINANTS' EXHIBIT No. 820 (Excluded)

TVA Press Release of March 13, 1934

Washington, March 13.—Low-cost electrical appliances to further Tennessee Valley electrification were brought a step nearer realization this morning with announcement by David E. Lilienthal, president of the EHFA and director of the Tennessee Valley Authority power program that some of the electric ranges and water heaters submitted by manufacturers give promise of being financed through the $10,000,000 set aside by the Reconstruction Finance Corporation for the purpose. Though Mr. Lilienthal at the same time made it known that the prices of electric refrigerators offered for use in this connection, are still too high for the families of modest incomes, he indicated that the general plan as worked out in cooperation with the nation's leading manufacturers was about to be put into operation in the Valley.

COMPLAINANTS' EXHIBIT No. 820 (Excluded)

Last Friday, at the headquarters of the National Electrical Manufacturers' Association in New York, Mr. Lilienthal and his aides examined some 40 varieties of these labor-[fol. 3615] saving devices, built to conform to specifications drawn up by the respective manufacturing groups. As a result of this exhibition and inspection, Mr. Lilienthal today made public letters which he has dispatched to various exhibitors (copies of which are attached).

In his communication to each of the firms which exhibited refrigerators, Mr. Lilienthal said in part:

"It is our conclusion that this price, while lower than the existing price, is still too high to accomplish the wide distribution in the huge market of people of moderate and low income which the Electric Home and Farm Authority contemplates. * * * We are committed to the opinion that electric refrigeration should be obtainable even in the humblest home, and particularly in states having a warm climate. The electric rates fixed by the Tennessee Valley Authority, and those recently fixed by negotiation between the TVA and companies which are part of the Commonwealth and Southern System, have removed cost of operation as a serious deterrent to electric refrigeration in the section affected by these rate reductions. I am confident that the electric refrigeration industry, in turn, is sufficiently resourceful to do its part in making such service generally available. Our objectives may call for an entirely [fol. 3616] new approach in the design of electric refrigerators, in which costs are markedly reduced without loss of essential quality and durability."

To the makers of ranges which met his approval, Mr. Lilienthal remarked:

"It is gratifying to note that the price you have submitted is substantially lower than the prevailing price for equivalent quality. Our technical committee advises me that you have not sacrificed quality or performance. This price reduction is in line with our urgent recommendation to you that a huge mass market of users of electric ranges would respond to substantially reduced prices, and that with this increased volume there would be a decrease in unit cost, with consequent benefit to consumer and manu-

COMPLAINANTS' EXHIBIT No. 820 (Excluded)

facturer, and stimulation of business and employment in many fields. Although your company and others participating have taken this first step in the direction we have been urging, I am convinced that still greater reductions can be effected in the future if manufacturers have further time to study the matter of design and develop, through perhaps a new approach to the structure of electric ranges, designs which will be lower in cost and yet of unquestionable quality."

[fol. 3617] To water heater manufacturers Mr. Lilienthal held out the prospect of laboratory tests "under recognized auspices and with the continued cooperation of the United States Bureau of Standards and the Bureau of Home Economics of the Department of Agriculture.

[fol. 3618] COMPLAINANTS' EXHIBIT No. 821 (Excluded)

TVA Press Release of March 21, 1934

Contracts to serve cheap TVA electricity to nine cities with a population of approximately 200,000 have been signed by the Tennessee Valley Authority, David E. Lilienthal, TVA director in charge of power, announced today.

Heading the list is Knoxville, Tennessee, which already has been granted a loan by the Public Works Administration to construct distributing lines. The city's offer to purchase the existing facilities having been turned down, officials are now negotiating with an engineering firm to draw plans for a new system.

Other cities with which contracts have been signed are Decatur, Florence, Sheffield, Tuscumbia, and Russellville, in Alabama; Pulaski, Tennessee, and Amory, Mississippi. Tupelo, Mississippi, the first city to sign for TVA power, is now being served with low cost electricity from Muscle Shoals.

"As soon as these cities have acquired their distribution facilities the Electric Home and Farm Authority will begin an intensive campaign to make available low-cost high-grade electrical appliances — householders," Mr. Lilienthal said today. "The outlook at Tupelo already indicates that there

COMPLAINANTS' EXHIBIT No. 821 (Excluded)

will be a large expansion in the use of electricity under the low TVA rates. As a result, the contracts with the eight cities just signed provide for a large expansion in their electric consumption."

[fol. 3619] COMPLAINANTS' EXHIBIT No. 822 (Excluded)

TVA Press Release of March 25, 1934

Mosquito control similar to that used when Wilson Lake was formed at Muscle Shoals will be applied to both Norris Dam and Joe Wheeler Dam reservoirs immediately on completion of those two projects by the Authority, W. G. Stromquist, sanitary engineer for the Tennessee Valley Authority, said today. * * *

Three control methods that have proved successful at Wilson Lake will be used on Norris Lake and Wheeler Lake. The most effective of these, since these lakes will be primarily power reservoirs, will be the operation of the power generating plants at the dams. The draw-down of the water for the generating of power will come at the season when millions of the mosquitoes are in the larva stage and floating on the surface along the shores of the lake. The release of the water at the dam will lower the reservoir and strand the mosquito larvæ on the shore, where lack of moisture and the heat of the sun will eliminate them as a health menace. The draw-down of the water by the power plant corresponds to the drainage operations now being carried on by CWA workers in the state malaria control campaign.

[fol. 3620] COMPLAINANTS' EXHIBIT No. 823 (Excluded)

TVA Press Release of March 26, 1934

Washington, March 25.—Radical departure in the design of refrigerators is the answer of the General Electric Co. to call made some weeks ago by the Electric Home and Farm Authority through its president, David E. Lilienthal, for proposals from manufacturers on a line of high-quality electric appliances to sell at low price in the Tennessee Valley area.

The new refrigerator submitted by General Electric is combined with an electric range, also new in design, forming a compact and attractive "electric kitchen" unit which can be quickly installed in any home.

"We have tried to meet your requirements by making an entirely new approach in design," says Mr. T. A. Quinn, vice president of the General Electric Co. in submitting the unit. "We are reducing costs in anticipation of greater volume, and at the same time improving the quality and durability of the product."

"This is what we have wanted," comments Mr. Lilienthal, "a fresh attack through the medium of advanced design upon the prices charged consumers for electrical appliances, to make these conveniences available to the home of modest income. The new General Electric refrigerator and range appear to be in line with our technical requirements."

Mr. Lilienthal states that he has also received definite assurances from a number of other manufacturers of totally [fol. 3621] new designs for refrigerators and ranges under way in their plants. He expresses "gratification of the progress made in the appliance program and announces acceptance, pending early submission of new designs, of revised price proposals made by the Kelvinator Sales Corp., Frigidaire Corp., and the Leonard Refrigerator Co. on standard refrigerators. The Kelvinator Sales Corp. expects to submit to EHFA an entirely new design in early April.

"We are confident that prices of refrigerators as approved for the Valley market will be between $70 and $80," declares Mr. Lilienthal. "This price is to be compared with present installed prices for the same equipment of around $115. And with the increase in volume we may anticipate further reductions in the future."

Mr. Lilienthal, who is also director of the TVA power program, indicates that after negotiation with TVA, recently lowered rates for electricity in the Valley localities served by private utilities will make it possible for the $10,000,000 customer-credit established for the EHFA to be extended through most of the Valley and also in some adjacent zones influenced by the TVA rural electrification program. He reports that utility companies in the southeast are inquiring as to what electric rate reductions they

COMPLAINANTS' EXHIBIT No. 823 (Excluded)

would have to make in order to bring the benefits of the EHFA program to their territories.

[fol. 3622] COMPLAINANTS' EXHIBIT No. 824 (Excluded)

TVA Press Release of March 28, 1934

Chattanooga has been selected as headquarters for the Electric Home and Farm Authority, David E. Lilienthal, its president and director of TVA, announced today.

"This location is predicated upon our ability to obtain suitable offices and display rooms in Chattanooga at a reasonable rental," Mr. Lilienthal said. "It will be necessary to have the display rooms and offices in the same building and centrally located."

"The electric division of TVA also will be centered in Chattanooga. The amount of personnel of both the EHFA and the electric division of the TVA will be limited at the start, but both will be expanded as the development of the program warrants."

Mr. Lilienthal said that Mr. F. J. Carr, Treasurer of EHFA and Mr. V. D. L. Robinson, administrative assistant to Mr. Lilienthal, would be in Chattanooga next Tuesday to look over proposed offices and display space.

Upon his return to Knoxville from Washington and the East Mr. Lilienthal expressed gratification over the speed with which manufacturers had prepared to market low-cost high-grade electrical appliances.

"The EHFA technical committee already has approved types of electric ranges, refrigerators, and water heaters," [fol. 3623] Mr. Lilienthal said. "Some of these models will be ready for market within a month."

Manufacturers are designing entirely new products which will no doubt revolutionize appliance design. An instance of this is a combined refrigerator and range which the General Electric Company has specifically designed for the EHFA. Kelvinator and Frigidaire engineers also are designing an entirely new type of refrigerator.

COMPLAINANTS' EXHIBIT No. 824 (Excluded)

Mr. Lilienthal also announced that the financial set-up of the EHFA has been completed and that the million dollar capital from the NRA has been made available. In addition to this, the EHFA has access to a credit of ten million dollars from RFC.

[fol. 3624] COMPLAINANTS' EXHIBIT No. 825 (Excluded)

TVA Press Release of April 5, 1934

David E. Lilienthal, president, Electric Home and Farm Authority, appliance subsidiary of the Tennessee Valley Authority, today announced the following administrative appointments for Electric Home and Farm Authority:

George D. Munger, to be in charge of development of domestic electric consumption in the Tennessee Valley area.

William B. Phillips, assistant to the president.

Forrest Allen, director of press and publications.

Mr. Munger has been associated with the Central Hudson Gas and Electric Co. at Poughkeepsie for the past 10 years. During the past five years he has been in charge of developing and executing a general program of domestic electrification in the area served by the Central Hudson Co., an area extending from Albany to Peekskill, N. Y.

In 1931 Mr. Munger was recipient of the McGraw award for the best developmental plan in a specific industry. The program encouraged the wider use of electric appliances [fol. 3625] in the home.

Mr. Phillips has been associated with several advertising agencies. Before his connection with EHFA he was with the agency of Ewin, Wasey and Co., New York. He has also engaged in educational work and for a year was a faculty member of Dr. Alexander Meiklejohn's Experimental College at the University of Wisconsin.

Mr. Allen has been a member of the editorial staffs of Scripps-Howard newspapers in Tennessee and before joining EHFA was with the News-Sentinel at Knoxville.

Officers of EHFA announced previously are Francis J. Carr, comptroller of the Tennessee Valley Authority, who will be treasurer of EHFA, and W. A. Sutherland, solicitor of the Tennessee Valley Authority, who will be counsel for EHFA.

COMPLAINANTS' EXHIBIT No. 825 (Excluded)

The Electric Home and Farm Authority is a special agency created by executive order of the President to carry out an appliance program for TVA. Its central offices are to be established at Chattanooga.

[fol. 3626] COMPLAINANTS' EXHIBIT No. 826 (Excluded)

TVA Press Release of April 6, 1934

Dr. H. A. Morgan and David E. Lilienthal, directors of the Tennessee Valley Authority, were to leave Knoxville today for a conference with the Alcorn County Electric Association at Corinth, Miss.

Mr. Lilienthal made the following announcement in regard to the conference:

The Tennessee Valley Authority will submit a proposal to the Alcorn County Electric Association for sale of the electric distribution system in the county and in the city of Corinth. The Authority purchased the system from the Mississippi Power Company under the terms of the TVA contract with Commonwealth & Southern Corp.

It will be proposed that the electric cooperative enter into a power and purchase contract with the Authority, by which it is expected that the cooperative will have completed the purchase payments for the city and rural system within a period ranging from five to seven years.

The Alcorn County Electric Association is a non-profit corporation incorporated under the laws of Mississippi.

[fol. 3627] Under the plan proposed the rural resident's investment in the cooperative will be the same per customer as that of the city resident. The rural and city rates will be the same, an innovation in electric service.

Base rates for electric service will be the same as those now in force at Tupelo, Miss., first municipality to contract for the Authority's power. Added to those rates, however, will be a surcharge which will take care of the purchase of the system.

At the completion of purchase from TVA, the rates will be reduced the amount of the surcharge.

COMPLAINANTS' EXHIBIT No. 826 (Excluded)

With the surcharge added, the new Corinth and Alcorn County rates will be substantially less than those paid prior to the Authority's entry into this area.

"This type of organization may be the key to the rural electrification program," Mr. Lilienthal said.

"It will mean that the power business of Corinth and Alcorn County is being conducted by a private, non-profit corporation rather than by the city government of Corinth and the county Government of Alcorn County.

"It is an entirely new departure in the set-up of a com-
[fol. 3628] bined rural and urban electric distribution system. One of the outstanding results will be an equality of rates between the farmer and his neighbor in town. This will be made possible by townsmen sharing a part of the cost of the rural system.

"The plan proposed also evolves a method of plant and system purchase without increasing the debt burden of the city and county. Payment for the system will be made from the purchase surcharge added to the rates."

The conference is set for Saturday afternoon.

[fol. 3629] COMPLAINANTS' EXHIBIT No. 827 (Excluded)

TVA Press Release of April 6, 1934

David E. Lilienthal, President, Electric Home and Farm Authority, appliance subsidiary of the Tennessee Valley Authority, today made the following announcement:

First sale and demonstration of electric appliances manufactured for the Electric Home and Farm Authority will be held at Tupelo, Miss., early in May. All appliances will carry a distinguishing mark of the Authority.

These appliances will be electric refrigerators, ranges and water heaters. They will be sold by Tupelo dealers on a term payment plan financed by EHFA, and are the products of a group of Manufacturers cooperating with the Authority.

Mr. Lilienthal and other officials of EHFA will attend the opening day sales and demonstrations at Tupelo, where civic organizations and municipal officials have planned a celebration for the day.

COMPLAINANTS' EXHIBIT No. 827 (Excluded)

Dealers will hold special demonstrations of the new equipment and EHFA will open a permanent exhibit and demon-
[fol. 3630] stration there. Daily instructional talks will be given in the use of the appliance.

Demonstration work will be organized under the direction of Miss Marie White of the TVA training division. She will have a trained assistant who will remain in Tupelo.

Guy Thaxton, division engineer for TVA in the Tupelo district, will become district manager for EHFA.

"The opening at Tupelo will mark the beginning of a concentrated effort to electrify the American Home," Mr. Lilienthal said. "Tupelo was selected for the launching of our appliance program because it was the first municipality to contract for TVA power."

"We hope and believe that the example being set by Tupelo will be followed throughout the country. It will be a demonstration of the widest possible use of electricity in the home.

"This abundant consumption of electric power is to be made possible by the combination of low electric rates and low-cost appliances, financed through EHFA.

"Application of our appliance program at Tupelo and in the surrounding area is a natural outgrowth of the spirit [fol. 3631] of active cooperation this community has demonstrated since the passage of the Tennessee Valley Authority Act a year ago."

The Electric Home and Farm Authority is a corporation established by direction of President Roosevelt to promote the use of low-cost electricity through low-cost appliances. Home offices of the corporation are being established at Chattanooga.

Mr. Lilienthal is one of the three directors of the TVA.

[fol. 3632] COMPLAINANTS' EXHIBIT No. 828 (Excluded)

TVA Press Release of April 7, 1934

David E. Lilienthal, President, Electric Home and Farm Authority, announced today that floor plans for EHFA offices at Chattanooga are now being prepared for the establishment of the appliance corporation's central headquarters at Chattanooga.

COMPLAINANTS' EXHIBIT No. 828 (Excluded)

Mr. Lilienthal said that the Authority expects to begin occupancy of its Chattanooga central office about May 1.

He said also that EHFA is contemplating the establishment of a completely electrified house in Chattanooga, as a part of the demonstration of electric appliance.

First sale and demonstration of the appliances approved by EHFA will be held at Tupelo, Miss., early in May. These appliances are electric ranges, refrigerators and water heaters.

Mr. Lilienthal said that the Authority was not ready to announce the building selected by it for its Chattanooga offices.

"Our offices in Chattanooga will be started on a limited scale," Mr. Lilienthal said.

[fol. 3633] "We expect to begin our occupancy of EHFA headquarters there about May 10. The extent of EHFA personnel in Chattanooga cannot be determined at present. It will depend upon the progress of our organization and the speed with which the program expands.

"In addition to a complete display of EHFA appliances at our headquarters, definite consideration is being given to the establishment of a house in Chattanooga which will be made into a fully electrified home.

"Such a house would be a center of attraction for all who are interested in applying the energy of electricity to the tasks of the home.

"It seems to me that some city in the United States is going to be called the electric city. We hope to see this title go to Chattanooga. It should become the actual realization of the Tennessee Valley Authority's power program."

Appliances approved by EHFA will be offered for sale by dealers in May in the cities using TVA power and throughout the area served by the operating companies of Commonwealth and Southern Corp.

This area includes the territories served by Tennessee Electric Power Co., Mississippi Power Co., Georgia Power Co., and Alabama Power Co. Large cities served in this area are Nashville, Chattanooga and Atlanta.

[fol. 3634] COMPLAINANTS' EXHIBIT No. 829 (Excluded)

TVA Press Release of April 9, 1934

William B. Phillips, assistant to the president of Electric Home and Farm Authority, will meet Wednesday in New York with advertising managers of electric appliance manufacturers who are cooperating with EHFA.

Purpose of the conference will be to coordinate advertising programs of manufacturers with the promotion work of EHFA. Representatives of all manufacturers whose products have met EHFA quality and price specifications will be present.

Companies which are manufacturing one or more appliances approved by EHFA are:

Estate Stove Company, Hamilton, Ohio.
A-B Stove Company, Battle Creek, Michigan.
Landers, Frary & Clark, New Britain, Connecticut.
A. J. Lindemann & Hoverson Co., Milwaukee, Wis.
Edison General Electric Appliance Co., New York City, N. Y.
Westinghouse Electric & Mfg. Co., New York City, N. Y.
Cleveland Heater Company, Cleveland, Ohio.
Hynes & Cox Electric Corp., Albany, N. Y.
McGraw Electric Company, Chicago, Illinois.
Malleable Iron Range Co., Beaver Dam, Wisconsin.
Kelvinator Corp., Detroit, Michigan.

Approved appliances will carry a distinguishing mark of the Authority and will be sold through regular dealer outlets. They will be financed on term payments by EHFA [fol. 3635] with the cooperation of local electric service utilities.

Sale of approved appliances is restricted to areas served by the Tennessee Valley Authority or by electric utilities under an appliance agreement with TVA which includes domestic rates low enough to make use of appliances feasible for low or moderate income groups.

First EHFA equipment will be electric refrigerators, ranges and water heaters.

[fol. 3636] COMPLAINANTS' EXHIBIT No. 830 (Excluded)

TVA, Press Release of April 10, 1934

George D. Munger, in charge of the domestic appliance program of Electric Home and Farm Authority, today announced that EHFA approved electric ranges and refrigerators would all retail at not more than $80.00, and all approved electric water heaters would retail at not more than $65.00.

Mr. Munger also announced the list of manufacturers and the appliances they make which have been approved by EHFA as to quality and price.

These manufacturers are:

Electric Ranges:

A-B Stove Company, Battle Creek, Mich.
Edison General Electric Appliance Co., New York City, N. Y.
A. J. Lindemann & Hoverson Co., Milwaukee, Wis.
Malleable Iron Range Co., Beaver Dam, Wis.
Landers, Frary & Clark, New Britain, Conn.
Westinghouse Elec. & Mfg. Co., New York, N. Y.
Estate Stove Company, Hamilton, Ohio.

Electric Refrigerators:

Kelvinator Corp., Detroit, Mich.

Electric Water Heaters.

Malleable Iron Range Co., Beaver Dam, Wis.
Westinghouse Elec. & Mfg. Co., New York City, N. Y.
Cleveland Heater Co., Cleveland, Ohio.
[fol. 3637] A. J. Lindemann & Hoverson Co., Milwaukee, Wis.
Hynes & Cox Electric Corp., Albany, N. Y.
McGraw Electric Co., Chicago, Ill.
Edison G. E. Appliance Co., New York City, N. Y.

Mr. Munger said that while only one refrigerator has been approved, negotiations for the approval of other makes are now under way.

At the outset of the appliance program, Mr. Munger said, the EHFA-approved line will have only one type in each item.

The electric ranges will all be of a three-burner, temperature controlled oven type.

The refrigerators will all be of four cubic feet capacity or its equivalent.

In the water heaters there will be some variation as to capacity, depending upon the make of the heater.

"The refrigerators and ranges carrying the approval of EHFA," Mr. Munger said, "will all retail for not more than $80.00 and the water heaters will sell for not more than $65.00.

"A distinguishing mark of the Tennessee Valley Authority will be carried on each appliance, so that the purchaser will recognize products accepted for the low-cost appliance program."

The appliance program will be opened early in May at Tupelo, Miss., the first municipality to contract for TVA power. At about the same time these appliances will be [fol. 3638] offered for sale throughout the area served by operating electric utilities of the Commonwealth and Southern system.

This area includes rural and city areas served by the Tennessee Electric Power Co., the Mississippi Power Co., the Alabama Power Co., and the Georgia Power Co. Included in the region are the cities of Nashville, Chattanooga and Atlanta.

Sale of EHFA approved appliances in these areas will be made possible through an agreement now being negotiated between Commonwealth and Southern and the Tennessee Valley Authority. This agreement will include the stipulation that domestic electric rates must be low enough to make use of appliances feasible for low or moderate income groups.

"Approval by EHFA of an appliance," Mr. Munger explained, "and the presence of the TVA mark of approval on the product means that the quality of the appliance is acceptable, the price reasonable, and the domestic electric rates where it is to be used are low enough to conform to the power policy of TVA."

The Electric Home and Farm Authority is a subsidiary corporation of TVA to promote use of electric appliances and finance their purchase on term payments.

[fol. 3639] COMPLAINANTS' EXHIBIT No. 831 (Excluded)

TVA Press Release—Undated

A new plan of power distribution, embracing an entire county whereby city residents and farmers will be supplied with electricity at the same rate, has been set up in Alcorn County, Mississippi, which includes Corinth, a city of more than 6,000 population is reported by the Tennessee Valley Authority through its adjunct, the Electric Home and Farm Authority.

Distribution will be managed by the Alcorn County Electric Association, a non-profit organization, incorporated under the laws of Mississippi, City and county governments will not be involved in either the purchase or management of the system.

The distribution lines in Corinth with two rural extensions were purchased by the Tennessee Valley Authority under terms of its contract with the Commonwealth and Southern Corporation. The TVA is completing the rural system. The County Association will enter into a power and purchase contract with TVA and take over the complete system. Base rates for current will be the same as those now in force at Tupelo, Mississippi, the first municipality to contract for TVA power. Added to these rates will be a surcharge which will amortize the cost of the system within [fol. 3640] a few years. When the Association has completed the purchase from the Authority, the surcharge will be removed. With the surcharge added, the new rates will be substantially lower than those paid prior to the Authority's entry into this area.

"This plan may be the key to the rural electrification program," reports Chairman Arthur E. Morgan of the TVA, who points out: "It will not increase the bonded indebtedness of county or city, and will not place additional duties upon public officials."

TVA Press Release of April 16, 1934

Electric Home and Farm Authority, Inc.

General Information (Supplement)

Emblem: A TVA emblem has been designed for certain electric appliances for purposes of identification. The presence of this emblem on an appliance means that the appliance has been built to EHFA specifications as to quality and design, and that the retail price fixed by the manufacturer is one which EHFA considers reasonably low.

Appliances to be financed.—In the beginning the EHFA-approved line of appliances will be confined to electric ranges, refrigerators and water heaters. There will also be portable motors and a pump motor. It is possible that in the course of a few months other items will be added to the list. The manufacturers whose appliances have been approved by EHFA to date as to quality, design and price are Electric Ranges:

A-B Stove Co. (A-B), Battle Creek, Michigan.

Edison General Electric Appliance Co. (Hotpoint), New York, N. Y.

[fol. 3642] A. J. Lindemann & Hoverson Co. (L&H), Milwaukee, Wisconsin.

Malleable Iron Range Co. (Monarch), Beaver Dam, Wisconsin.

Landers, Frary & Clark (Universal), New Britain, Connecticut.

Westinghouse Elec. & Mfg. Co. (Westinghouse), New York, N. Y.

Estate Stove Co. (Estate), Hamilton, Ohio.

Electric Refrigerators:

Kelvinator Corporation (Kelvinator), Detroit, Mich.
Leonard Refrigerator Co. (Len-a-dor), Detroit, Mich.
Norge Corporation (Norge), Detroit, Michigan.

Electric Water Heaters:

Malleable Iron Range Co. (Monarch), Beaver Dam, Wis.
Westinghouse Elec. & Mfg. Co. (Westinghouse), New York, N. Y.
Cleveland Heater Co. (Rex), Cleveland, Ohio.

COMPLAINANTS' EXHIBIT No. 832 (Excluded)

A. J. Lindeman & Hoverson Co. (L&H), Milwaukee, Wisconsin.

Hynes & Cox Electric Corp. (Red Crown), Albany, N. Y.

McGraw Electric Co. (Clark), Chicago, Illinois.

Edison General Elec. Co., (Hotpoint), New York, N. Y.

Philadelphia Elec & Mfg. Co. (Pemco), Philadelphia, Pa.

Prices, Description and Delivery Dates: Prices, descrip-
[fol. 3643] tive matter, and probable date delivery can be made can be secured through the local dealers representing the manufacturers named above. It is expected that full information will be in the hands of dealers in EHFA territory around the 1st of May.

Consumer outlets.—Arrangements will be completed as rapidly as possible for the sale and delivery of EHFA approved appliances through existing dealer outlets. Similar outlets will be established from time to time if it is found necessary to do so in order to render proper and convenient service to the citizens of the area.

Territory.—EHFA-approved appliances will be placed on sale by dealers about May 1st in all communities now directly served by TVA power. In addition, these appliances will also be on sale throughout the entire area served by the Commonwealth & Southern Corporation's operating companies under special agreement with EHFA. These are the Tennessee Electric Power Company, the Alabama Power Company, the Georgia Power Company, and the Mississippi Power Co.

TVA emblem-bearing appliances cannot be sold or financed under the EHFA plan in a community until the local electric
[fol. 3644] utility in such community has entered into a special agreement with EHFA. Items included in this agreement will have reference to domestic rates for electricity, disposition of installation charges, collection methods, etc.

Central Office.—Central offices of EHFA are to be established at Chattanooga about May 15. Until permanent offices have been established, inquiries should be addressed to Electric Home and Farm Authority, Knoxville, Tennessee. Inquiries to manufacturers can be addressed directly to them at addresses given above.

[fol. 3645] COMPLAINANTS' EXHIBIT No. 833 (Excluded)

TVA Press Release of April 17, 1934

David E. Lilienthal, president, Electric Home and Farm Authority, appliances subsidiary of the Tennessee Valley Authority, today announced the selection of a special TVA emblem to be placed on all appliances sold under the EHFA program.

The emblem was designed by Young and Rubicam, a New York advertising agency, and was selected from a large number of emblems submitted by various advertising agencies.

It consists of a blue hand holding a lightning bolt in red, with TVA in large red block letters below the hand. Beneath the TVA, there is the slogan: "Electricity for all."

This emblem, Mr. Lilienthal said, would be first used on the electric ranges, refrigerators and water heaters being manufactured for the EHFA program.

Sales of these products will begin early in May in Tupelo, Miss., first municipality to contract for TVA power. About the same time sales will begin also in areas served by the operating companies of the Commonwealth and Southern Corporation, which has an appliance agreement with the Authority.

"We shall retain rigid control of the use of this emblem [fol. 3646] on appliances," Mr. Lilienthal said. "It can be used only on appliances manufactured to EHFA quality and price specifications, and only on those appliances when they are sold in areas served at TVA rates or at rates which the Authority considers low enough to make use of this equipment feasible to families of low or moderate income."

The emblem will be used throughout the power department of the Tennessee Valley Authority, Mr. Lilienthal said. Eventually it will be placed as an identifying mark on all equipment of this branch of the Authority.

TVA Press Release of April 22, 1934

Address of David E. Lilienthal Before the Tennessee Valley Institute of the University of Chattanooga, Chattanooga, Tennessee, 8:00 P. M., April 21, 1934

The Future of Industry in the Tennessee Valley Region

It is my firm conviction that the Tennessee Valley region is to be the scene of an expansion of industry which in the course of the coming decade will change the economic life [fol. 3648] of the South. If this industrial development is controlled in the interest of the entire community and fitted into a national program, it will stimulate and regenerate the industrial life of all America. We in the Tennessee Valley area, in a very real sense, face a new frontier—an industrial frontier. There lies before us an opportunity for industrial leadership, calling for the courage, the energy and the self-discipline of the pioneers on the Western frontier of a century ago.

It is my purpose this evening to lay before you and my other neighbors in the Tennessee Valley, facts and reasons which have led me to the conclusion that we are about to witness in this area a period of industrial expansion unprecedented in its magnitude and opportunities.

I should like first of all to enumerate those factors in the economic situation of this great region upon the foundation of which a period of industrial development will arise. I shall then discuss each of these factors more in detail.

First. We can have in this region low-cost electric power in almost unlimited quantities.

Second. This is an area of natural resources almost unequalled in their variety and richness, not the least of which [fol. 3649] is a climate most favorable to health and well-being and the successful pursuit of agriculture.

Third. Is the great potentiality of this area as to economical transportation—water, rail and highway.

Fourth, and perhaps most important of all: In creating the Tennessee Valley Authority the President and Congress have made it possible for this area to develop its natural resources, its power and its transportation in accordance

with an intergrated and orderly plan. Under such a plan the short-sightedness and greed of individuals and single communities can be controlled, and the interests of the people as a whole kept paramount. Such an integrating and unifying force in the development of industrial resources is unique in our nation's history.

I turn first to the reason which I have suggested as insuring a period of great industrial expansion for the South —the availability of cheap electric power.

The TVA has under way, as you know, a comprehensive program for the development of the power resource of the Tennessee River and its tributaries. No more ambitious program of hydro-electric development has ever been actually undertaken in this country. Aided by an exhaustive [fol. 3650] survey prepared by the corps of Engineers of the United States Army under the direction of Colonel Harold C. Fiske, the Authority is constructing what probably will be the most efficient system for the utilization of the water resources of a vast area.

As you know, we have started with the nucleus of Wilson Dam at Muscle Shoals. Within two years two more great dams will be completed—one, the Norris Dam on the headwaters of the Clinch River near Knoxville; the other, the Joe Wheeler Dam just above the Wilson Dam in Northern Alabama. Four other major dams of various types will probably be approved for early construction. A large staff is now planning the dam-building program for the next decade.

Everything considered, the electricity produced in this vast public hydro-electric system will be as cheap as power can be produced in any part of the United States, and much cheaper than in many sections. One reason for this is the efficiency which arises from integrated control of an entire watershed under single public ownership and administration. That ownership and control is one which is dominated by one purpose and one purpose only—service to the whole people to whom these streams belong. By the use of storage reservoirs and central control, all the vast economies [fol. 3651] of large-scale production will be utilized, and the Tennessee River and its tributaries will be made to yield their great potential wealth into the hands of the people of the Tennessee Valley. The presence of coal in great quan-

tities for standby and auxiliary steam plants will tend to keep the cost of electricity below that possible in areas having favorable hydro-electric power but in which coal is costly.

Perhaps the most important factor in insuring a low cost for hydro-electric power in this region is the fact that the distribution of this power to the factories and homes and farms, for the most part, will be in the hands of public agencies. Industries seeking to use large blocks of hydro-electric power in the Tennessee Valley will not be forced to support dizzy towers of inflated capitalization. They will not have to pay for the financial misdeeds of the builders of utility pyramids. Under public distribution of power with centralized accounting, control and supervision in the hands of a regional authority, there will be the greatest incentive to economy and managerial efficiency. Each community will try to make its record better than that of its neighboring community.

Furthermore, since the operations are public operations, they will be subject to that constant stream of public [fol. 3652] criticism which, while at times unpleasant to those who are thin-skinned, will insure the most careful scrutiny of operations. This perennial scrutiny of the work of public servants will certainly do more to protect the consumer against inefficiency and excessive rates than the sympathetic wrist-tapping which goes under the name of public utility regulation in so many states.

It is unnecessary to demonstrate to this audience the importance of low industrial power rates in the development of an industrial program. Since the first month of operations in Tupelo under the TVA schedule of rates put into effect in that Mississippi municipality, we have made comparisons of bills paid by certain industries. These comparisons show in a striking way the results of low-cost power in bringing down operating expenses. I have here a statement of the Reed Brothers Incorporated, power bill for January, 1934, and March 1934. The January billing was under the old rate; the March billing was under the new TVA rate. This statement shows that Reed Brothers in January paid $210.25, while in March under the new schedule they paid $145.38. This meant a reduction of $64.87 in the power bill, or reduction of 30.8%, the amount of power consumed in-

creased 55.2%. I have here the billings of the McLeran Ice [fol. 3653] Cream Company for January and March, 1934 power. Under the old rate, this company's billing was $92.19, while under the new rate the billing was $56.23, or a reduction of $35.96, which amounted to 39%. In March the power consumption was 26.9% greater than the January consumption, yet the cash paid for the power was 39% less.

Perhaps the major industry in Tupelo is cotton milling. I have here a statement of the Tupelo Cotton Mill's bills for January and for March this year. In January, under the old rate, the Tupelo Cotton Mill paid $3,181.33, while for the month of March, under the new TVA rate, the billing was $1,896.40, or a decrease of $1,284.93. While the bill for March power used by this mill was 40.4% less, the mill, in the same period consumed 26% more power.

The significance of such figures in textile manufacturing is clear. According to the Textile World, the power costs in Southern textile mills operating under code requirements range from about 10% to 15% of all manufacturing costs, including plant overhead, but excluding cost of raw materials, depreciation charges and federal taxes. With this in mind it is easily seen what an important cost factor power rates can be in the South.

[fol. 3654] It is true that in some other industries the cost of power represents a smaller portion of the total cost of operation, but there are many industries, including those especially adapted to the resources of the Valley, such as electrochemical and light metal industries, in which power is a dominant cost factor. It is inevitable that industry will turn to this region as the Tennessee River yields to this program for the development of low-cost power.

Nor is this all. I am advised that there are many lines of industry which cannot now profitably operate because of high power rates; these will find that they can operate and successfully function in this area. To my desk at Knoxville there has come in recent months an impressive number of inquiries from industrialists in various fields, requesting specific information concerning TVA power rates, and asking advice respecting locations for industrial enterprises requiring large quantities of power. As our program pro-

gresses and the country hears not only of what you and I here in this region plan to do but what we are actually doing, these inquiries will increase and will be translated into actual operations and actual payrolls. • • •

The ways in which the TVA can function in carrying [fol. 3655] forward this program of industrial expansion are many. In some capacities it will act as a proprietor, such as in the case of its electric operations. In others, it will furnish the disinterested technical advice of engineers, accountants and business men. In still other capacities, it will seek to smooth out those jealousies and rivalries between cities which lead to destructive animosities and prevent healthy industrial development. In stimulating and aiding the readjustment of agriculture the Authority will be exercising a function which will make for a sounder industrial future. Through the nation-wide publicity given the Authority's operations, the advantages of the region will receive the widest attention of business men the country over.

I am very definitely of the opinion that it is the Authority's duty to encourage and stimulate the growth of large-scale industry in the Tennessee Valley area. We are making provision for one of the largest hydro-electric developments in the world, with a potential three million horse power available. We are expending, and expect to expend, millions upon millions of dollars in construction activities, all looking toward the development of more and more power. Although we are bending every effort to greatly increase [fol. 3656] the use of electricity in the home and on the farm, it is obvious that only a large-scale industrial expansion will absorb the great pool of power which is thus being created. As we lay our plans for developing this cheap power in great quantities, it seems to me to be mandatory that we also lay plans for utilizing it in a industrial expansion program.

There is nothing inconsistent in urging the development of large-scale industry and at the same time promoting, as we are, a program of small-scale industry in connection with agriculture. There is no conflict in these two aspects of a single program. The two develop side by side. This is not the appropriate occasion to discuss in detail the particular kinds of industries and the special types of operation

which I believe should characterize this industrial expansion nor to indicate the hopeful prospects already near at hand, for decentralization of great industrial operations. The point I should like to make now is to repeat my conviction that it is the Authority's duty as well as its privilege to encourage the growth of large-scale industry.

This program shou' l be based squarely upon the obvious economic benefits which industry will enjoy in the area. It should be based upon the factors of cheap hydro-electric [fol. 3657] power and an abundance of mineral and other natural resources. It will be a sad day for Southern industry if the presence of a new factory here means merely the creation of an industrial graveyard in New England, or some other section. What I see for this area is an economically sound growth of commerce and manufacturing, which will fit itself into a national economy. It seems to me that it would be no less than fatal and destructive to the entire program if industry were to come to the Valley on any other basis than the natural advantages of the region. The South has ample inducement to offer on strictly business merits of the advantages found here. I believe that we all recognize that the South today needs no false lures to win the industrial development which should naturally be here.

I view the whole question of proper exploitation of the mineral resources of the Tennessee Valley as pertinent to this new industrial program. Two phases of this matter deserve attention.

First, in the development of mineral resources during the past decade science has been giving increasingly greater attention to the chemical development of minerals as opposed to purely mechanical processes. As a result of this we may, [fol. 3658] therefore, expect our own developments to lead us into the creation of new products and into the use of new raw materials.

Second, through the ability of the Tennessee Valley Authority to supply low-cost electric energy and the presence of low-cost energy from other sources, we are not merely supplying a cheaper source of mechanical power, but we are making possible the development of electro-chemical and electro-metallur-ical industries which heretofore have been impossible of profitable operation owing to the high cost of electric energy employed in the process.

COMPLAINANTS' EXHIBIT No. 834 (Excluded)

Those two considerations open up entirely new fields for the consideration of industrialists and chemists in the future development of the mineral resources of the Valley.

TVA Press Release of April 22, 1934

The Electric Home and Farm Authority, appliance subsidiary of the Tennessee Valley Authority, will occupy the ground floor of the James Building, Eighth and Broadway, Chattanooga, Tenn., David E. Lilienthal, president of the corporation, announced Saturday. Central offices of EHFA will be situated at Chattanooga.

Temporarily, Mr. Lilienthal said, EHFA administrative offices will be in the new Federal Building at Chattanooga. The ground floor of the James Building will be occupied entirely by a permanent display of electric appliances, Mr. Lilienthal explained.

Later on, it is expected that the administrative offices will be moved to the James Building from the Federal Building. The display room in the James Building is expected to be ready in about 30 days.

EHFA will also occupy the first floor of the old post-office building at Chattanooga, in which it will maintain its mailing department and a photographic department.

The display of appliances in the James Building will [fol. 3660] be one of the most comprehensive in the country. All types of equipment will be represented, including the special lines of low-cost refrigerators, ranges, water heaters, portable motors and pump motors, which are to carry the distinguishing mark of the Authority.

Design of the display floor is being carried out under the direction of R. A. Wank, chief architect of the Tennessee Valley Authority.

[fol. 3661] COMPLAINANTS' EXHIBIT No. 836 (Excluded)

TVA Press Release of April 23, 1934

David E. Lilienthal, director of the Tennessee Valley Authority, today announced that the Authority had entered

into a contract with Young and Rubicam, Inc., a leading advertising agency of New York.

It is believed that this is the first time a department of the federal government has retained an advertising and merchandising agency for consulting services.

Mr. Lilienthal said that the agency will assist TVA in planning a campaign to promote the greater use of electricity in the home and on the farm. The contract is for a period of four months.

Young and Rubicam, Inc., is the agency which designed the emblem which Electric Home and Farm Authority will use in its program to promote the use of electrical appliances. The agency will cooperate with EHFA generally.

"The Authority has retained the consulting and technical services of Young and Rubicam to aid the power development of its own territory and to assist in our appliance program carried on under EHFA.

"Consultant and technical services of Young and Rubicam will be used by TVA in perfecting its plan for the marketing of power and to assist the Authority in effecting the [fol. 3662] most efficient ways for increasing the consumption of power by the Authority's customers.

"The agency will aid the Authority in formulating a general long-time plan for the program of increasing the use of appliances."

Mr. Lilienthal said that at the end of the four months period, Young and Rubicam is to submit to the Authority a plan for its promotional work, which will include a coordination of efforts of manufacturers, dealers and utilities. The contract provides for a broad cooperation between the Tennessee Valley Authority, EHFA and Young and Rubicam.

Negotiations for the contract were carried on by Mr. Lilienthal, George D. Munger and William B. Phillips for EHFA and by S. S. Larmon, C. L. Whittier and Donald Payne, for the agency.

Executives of Young and Rubicam, accompanied by stagg artists and merchandising specialists for the agency, have been in Knoxville for several days working on plans with TVA and EHFA officials.

TVA Press Release of April 25, 1934

Electric Home Specialists.

That's the new name for the Electric Home and Farm Authority's corps of appliance demonstrators.

Guy Thaxton, the Authority's district manager in Northern Mississippi, contributed the idea at a school for the workers in Knoxville.

The Electric home specialists will not be salesmen. Rather, they will serve as instructors in the use of approved electrical appliances, and as counsellors in the application of electricity to the home and farm.

They will work first at Tupelo, where the first showing of appliances carrying the TVA emblem will begin early in May.

[fol. 3664] COMPLAINANTS' EXHIBIT No. 838 (Excluded)

TVA Press Release of April 25, 1934

Electricity's promise to the housewife is to be portrayed in an "electrical home" by the Electric Home and Farm Authority.

The home will be built at Wilson Dam, Ala., President David E. Lilienthal announced yesterday.

The Electric Home and Farm Authority and its parent, the Tennessee Valley Authority, will cooperate in building it.

It will be a typical three bedroom home—heated electrically. The same system will condition its air in winter, cool it in summer.

The kitchen will be electrical. A range, refrigerator, water heater—all bearing the upright arm and power symbol of TVA approval—will be on view there. An electrical dishwasher will be there, too, with lesser kitchen appliances.

In the basement there will be a powered laundry—washing, ironing to be done electrically.

Thousands of tourists will see the permanent display. The house will be designed as a national center for visual demonstration of the electrical idea.

Parts of the basement and attic will be set aside for display of equipment not installed in the home. An auditorium annex will be built for movies, lectures and a resting place for visitors.

TVA Press Release of April 25, 1934

Address of David E. Lilienthal, Director and General Counsel of the Tennessee Valley Authority, Before the League of Women Voters, Boston, Massachusetts, Evening of April 24, 1934

It is a matter of particular gratification to me to have the opportunity to speak to this great League on the subject of electricity, for you have a two-fold interest in this whole question. As a group of women united to take part in the political life of the city, state, and nation, you have an immediate and direct interest in the community control of public utilities. As women of America, individually, you are the most important of all users of electricity—the users of electricity in the home.

This League for years has been distinguished by its alert and effective interest in public utilities and their regulation. Your organization has been singled out by more than one writer as being unique among associations of women—because you have demonstrated an independence of thought [fol. 3666] and action. Dr. Ernest Gruening, in his book, The Public Pays, makes special mention of this League as being on- of the few women's organizations which remained free of utility influence during the great propaganda campaign of the '20's.

Not only has this League demonstrated an active interest in the field of public utilities generally, but you also have played an important part in the development with which I am now associated—I speak of Muscle Shoals and the Tennessee Valley program. There can be no question but that without the support of organizations of your prestige, Senator George Norris might have fallen short of victory in his decade-long fight to retain the great hydro-electric properties at Muscle Shoals for the use of all the people.

It is, therefore, particularly fitting that a year after the passage of the Tennessee Valley Authority Act, we should be making a report to you of the progress of that program which the League of Women Voters so ably championed.

The power program of the Authority is an important part of its present plans and also of its long-range regional program. The starting point in any discussion of this power

policy and program must be this: that the distribution of electricity is not like the ordinary private business. By its very nature, the generation and distribution of power, [fol. 3667] whether by private or public agencies, is a public business, for in our present-day community life we are all utterly dependent upon that service.

The Authority is charged with the duty of carrying out a national power policy, and the safeguarding of the public interest in the country's greatest resource. This program profoundly affects the future development of our country's commerce, its industry, and the well-being of all its people. It is not a policy that has been formulated over night. It has been sponsored by the President; it has been thoroughly debated in the Congress. The power program of the Authority is an integral part of a larger policy for the economic development of the United States.

In order to comprehend fully the reasons for the power program set out in the Tennessee Valley Authority Act, it is necessary to recall what has been happening in the United States during the past ten years. It is necessary to understand that the people back home have become thoroughly aroused; that they are determined that the disgraceful looting of the public business of power shall not be repeated. You are all familiar with the sordid story. I need not recall to your minds the quarter of a million dollars which that late resident of Greece, Mr. Samuel Insull, paid to the [fol. 3668] chairman of the State Commission which was supposed to be regulating his Illinois utilities. It was probably no surprise to you when you learned that a Pennsylvania public utility paid the hospital bills of the Chairman of the Pennsylvania Public Service Commission. Those of you who observed the political methods of many utilities during the past ten years were shocked but not surprised at the recent disclosures concerning Chairman Thayer of the Public Service Committee of the New York Senate.

The deepest resentment over the mis-management of the power business has been among the ranks of the small investor. Much of the capital by which the great financial giants have carried on their operations has come from the savings of men and women of modest means. The widow with her small insurance fund, for example, was assured by the stock salesman that public regulation would protect

her against wildcat financial operations, that the public utility industry was in the hands of men who regarded themselves, in effect, as trustees of a great public business. And when the small investors learned the real facts, their resentment has been greater even than that of the consumer.

Nor have the people back home forgotten the story which was revealed by the Federal Trade Commission in its investigation of the propaganda activities of the electric in- [fol. 3669] dustry. There has never been a bolder attempt to buy the public opinion of the people of the United States. That widespread scheme of capturing the sources of public information would have destroyed the American system of democracy.

But the most serious indictment of the public utility industry is that it has not devoted itself effectively to its primary function of making electricity available at low cost to the American home. The best evidence of this situation is the simple fact that after fifty years the average use of electricity in the homes of this country is not more than 50 kilowatt hours a month. This question concerns your League, not only as an organization for civic activity, but as a group of individual women responsible for the home.

Now this is what had been going on throughout the United States—financial excesses, political corruption, an enforced frugality in the use of a great natural resource. In many states it had become perfectly obvious that the regulators were not regulating the utilities, but that in effect the utilities were regulating the regulators. In other states the regu latory commissions were doing an honest and sincere job, but were rendered ineffective by the interminable procedure of regulation. And so to supplement and reinforce regula- [fol. 3670] tion, Congress passed the Tennessee Valley Authority Act. This act is not an assault upon private ownership and management of public utilities; but it is a determined attack on private mis-management of the public business of power at the expense of the people back home—housewives and investors alike.

The first duty of the Tennessee Valley Authority in its power program is to set up what the President has called "yardstick" by which to measure the fairness of electric rates. It has an additional function. It is a reminder that unless that business is carried on by private corporations

with a due sense of responsibility to the paramount public interest, that the public, at any time may assume the function of providing itself with the necessity of community life.

What the Tennessee Valley Authority is required to do in its power program is to set up an area for power operations. This part of its undertaking I can best describe by taking a specific case. The Authority has entered into a contract with the City of Tupelo, in Northeastern Mississippi, the first agreement for the sale of power from Muscle Shoals to any municipality. I would like to outline to you some of the terms of that contract, which are standard with all communities served by the Authority.

[fol. 3671] Under the contract the Authority agrees to supply power at wholesale, which the City of Tupelo then distributes through its publicly-owned electric distribution system. The cost of the power to the City of Tupelo represents a saving to the municipality of 60% of the cost of equivalent power under its previous service by a private power company.

Almost as important as the price of current which the City will pay, are the relationships set out in the contract. The City agrees to administer the electric utility as a separate unit, and not to merge the utility's funds or accounts with those of the municipality. This is a safe-guard against political interference in the administration of the utility plant. The City further agrees to keep its accounts according to a uniform system, so as to reveal all operations of the plant. This is a safe-guard against unsound practices and an incentive to improve methods. These accounts will be regularly audited by agents of the Valley Authority.

The municipality agrees to apply sound business principles to the use of its electric revenues. Revenues will be first applied to operating expenses, including taxes, and then to payment of interest on bonds applicable to the electric system, and toward the retirement of those bonds. A [fol. 3672] reasonable reserve is to be set up for new construction and contingencies. Taxes are to be paid by the municipal utility at rates equivalent to the taxes which would be levied against a privately-owned utility. Then the taxpayers' general fund will receive a return on the municipality's equity of 6% a year. After these items have been

provided for out of the revenues, the City agrees to apply the surplus to further reductions in rates to consumers, on a nondiscriminatory basis.

It will be apparent to you that the City of Tupelo proposes to require the consumers of power to pay all of the costs of the electricity which is furnished to them. Instead of the taxpayers subsidizing this enterprise, they are going to benefit in two ways. First, they are going to receive taxes from the publicly-owned utility, and second, they are going to receive a return on their equity which will go toward the relief of taxes.

As consumers, the residents of Tupelo will be afforded a much wider use of electricity than they have found possible under the higher rates in effect before the City was served by TVA power. An average home, using electricity for lighting, refrigeration, a vacuum cleaner, irons, and other [fol. 3673] electric appliances, will consume about 70 kilowatt hours a month. At Tupelo, the cost of this service would be $1.90. For a home that uses an electric range in addition to a variety of other appliances the consumption would be about 250 kilowatt hours a month. At Tupelo, the householder would pay $5.00 for this service.

So much for the first objectives of the Tennessee Valley Authority—the regulatory, public control purposes of this national power policy. We come then to the second objective, of at least equal significance.

The power program of Congress and the President has as its major objective a constantly wider use of electricity. The fundamental problem of the Tennessee Valley Authority, of the electric industry, of the Federal Government, is to devise economic ways and means to make electricity generally available, of promoting the widest possible use of power in the home, on the farm and in the factory. I have referred to the fact that at the present time the average monthly use of electricity for domestic purposes is about 50 kilowatt hours. That figure is a challenge to the electric industry and to the people of the country. We know that the figure of 50 kilowatt hours a month can be increased several times, for in some sections of our country and in our neighbor country of Canada that very thing has been accomplished.

[fol. 3674] Here, then, is the crux of the power problem in the United States today: The people need and want elec-

tricity. We have an almost unlimited source of supply. The problem is how to put this electricity into the homes, the farms and the factories of the United States.

It has been long recognized that there are two barriers to the fullest use of electricity. The first has been the barrier of high rates. The second has been the barrier of high-cost electric using appliances. We are now undertaking in the Tennessee Valley area a plan which may offer the means of breaking down this second barrier.

The utilities' position has been that until the use of electricity is greatly increased, rates cannot be drastically decreased. They urge, moreover, that until electric-using equipment is brought down to lower price levels, no great increase of domestic consumption is possible. Appliance manufacturers have contended, on the other hand, that unless electric rates come down, volume production of equipment is impossible, and without this volume production, the cost of appliances cannot be substantially reduced.

Electric utilities, manufacturers of appliances and the consumers have all suffered in this closed circle. Here was [fol. 3675] an opportunity for government represented by the Tennessee Valley Authority, to step in as a stimulator and coordinator—helping not only the manufacturers and utilities, but making possible to the family of low or average income a wide use of electricity. The Electric Home and Farm Authority, created by order of President Roosevelt, is the agency which will assume this role. Conferences have been held with the electric manufacturers of the country. It has been decided that Electric Home and Farm Authority could make the attack on high-cost appliances in five ways:

First, by assisting in financing the consumer in purchasing efficient electrical equipment for home and farm at low prices.

Second, by obtaining reductions in electric rates by agreement with the utilities, publicly and privately owned, so as to make use of this equipment possible for the average householder and farmer.

Third, by engaging in educational work and research to lower still further the cost of electric equipment and to make it better adopted to the needs of the average home and farm.

Fourth, by encouraging the production of new designs. This has already resulted in the creation of a combined range and refrigerator, and other totally new designs are [fol. 3676] soon to appear.

Fifth, by protecting the consumer against poor appliances, by setting up specifications and testing laboratories.

Through the active cooperation of about fifteen manufacturers, EHFA is prepared to launch its electric equipment program next month. The first items offered will be electric ranges, refrigerators, water heaters, a portable farm motor and an electric water pump. All of these appliances have been built by the manufacturers to meet price and quality specifications of the Authority: The prices are from 25% to 35% lower than those now prevailing for equivalent equipment; the financing costs are far below present charges for this service.

In order to identify this line of appliances, each item will carry the emblem of the power department of TVA, so that the purchaser knows then he sees this emblem on an appliance that it is a part of the program. Sales of these appliances, through the regular dealer outlets, will be made first in those Valley sections served by TVA power, and in the territories served by privately-owned public utilities which are under agreement with Electric Home and Farm Authority. This program begins early next [fol. 3677] month in four Southeastern states, and will probably be expanded.

What is going to be the effect of the Authority's power program on the investor in soundly financed public utility securities? This is an acute and difficult question which I have no desire to evade.

The Authority must carry out the national policy entrusted to it. It must acquire a market for its power. It must work toward a wider use of electricity. None of these objectives will result in the predicted calamities to the industry and its bona fide investors. The Authority early adopted a policy of buying, at fair prices, the property of private utilities in the area selected for its "yardstick" operations rather than to duplicate facilities and engage in destructive competition. The policy was given concrete expression in a comprehensive contract entered into on

January 4 of this year with the major operating companies of the Southeast embraced in the Commonwealth and Southern system. In order to avoid competition between the City of Knoxville and the Tennessee Public Service Company operating in that city, and a duplication of physical facilities, the Authority has offered to buy that Company's property useful for electric operations at a price which will protect every dollar of presently useful investment. You can see, therefore, that if there is a genuine [fol. 3678] desire to work with this project, and not to obstruct or destroy it, ways and means can be found for the electric industry and for the Government to work without friction in expanding the use of electricity for the benefit of all of our people.

This, then, the *the* national power program which the Tennessee Valley Authority is carrying forward. I believe you will agree with me that it is a constructive program, that its sole object is to benefit and to protect the consumer of electricity and to make for a constantly wider use of electricity by the housewives of America.

One might suppose that such a program would be safe from selfish attack. That is not the case. There has been launched a concerted and apparently well-financed plan to destroy this entire project. As representatives of one of the most directly interested groups in the United States, it is appropriate that I should submit to you the facts representing this conspiracy to destroy the President's program in the Tennessee Valley and in other parts of the country.

According to reports in the New York Journal of Commerce, the American Federation of Utility Investors, Incorporated, had its genesis early this year in a committee formed after the annual meeting of one of the largest util- [fol. 3679] ity holding companies. A report of this meeting in the New York Journal of Commerce, in its issue of January 11, stated that it was proposed that "the industry adopt an aggressive policy and arouse the stockholders to the fact that their interest was being jeopardized". The Journal proceeds—"It was suggested that it would be better for stockholders to make the move rather than utilities themselves". One of the great difficulties, to quote again from the Journal, "surrounding the formation of the stockholders committee was the securing of sufficient funds

for expenses. Suggestions had been made that the utilities contribute. This, however, met with little approval, for it was felt that the movement would then be labeled as coming from the companies. Large investors, institutions, banks and insurance companies were approached with the result that the association has made subscription voluntary, in the amounts of one dollar or more a year from all members."

With this "independent" beginning, then, the Federation was organized. As the Journal said in this same account of January 11, "The American Federation of Utility Investors was formed by prominent men not identified with the utility companies, with headquarters in Chicago. It was felt by some that the movement originating in the [fol. 3680] Middlewest rather than in New York would immediately eliminate any feeling that it was being engineered by interests centered in the Metropolitan area."

So we see that this organization, if we are to believe the New York Journal of Commerce, from the very outset laid its plans to deceive the public of its true origin. To disguise its origin and alliance with the financial world of New York, it was decided that the Federation should have its headquarters in Chicago. The irony of protecting the Federation's fair name by moving it to Chicago, of all places, is almost overwhelming. According to a writer in the Chicago Tribune's financial department, the Federation of Utility Investors is circularizing utility investors with the aid of some of the largest utility holding companies, which he names.

The purpose of this movement is evident. In an attempt to save holding company capital superstructures, much of which never did have sound business justification; some holding companies, disguised in the robes of the widows and orphans, are ready to pit the securities owners against the consumers. Twenty million American homes are to be denied the full benefits of a great national resource in order that inflated stock may pay out. On such an issue there [fol. 3681] can be only one result. The tide of public opinion will continue to run against an industrial leadership which lends itself to such a scheme. The American people will never submit to a program of this sort.

COMPLAINANTS' EXHIBIT No. 839 (Excluded)

Private ownership of public utilities can survive and flourish, only if a new leadership takes the helm of the public utilities industry, a statesman-like leadership of moderation. There are many men in the industry, as I well know, who have the insight and the hard-heartedness to appreciate this fact, but they are sadly in the minority.

Among the changes the times demand of a new leadership, permit me to suggest four which seem to me of immediate and pressing importance.

First. The new leadership should demand a real housecleaning in the industry. No more change of names will suffice. The Insulls have fled the scene, but the practitioners of their business and political methods are still high in the councils of the industry.

Second. The public utility industry must cease to oppose every reasonable effort to strengthen regulations. The action of the utilities of New York State in opposing and almost successfully opposing, Governor Lehman's moderate program for the strengthening of public regulation, was an amazing performance.

[fol. 3682] Third. The public utility industry, like other conservatively operated businesses should write off or write down that portion of its capital structure which does not represent value. The policy of retiring capital obligations rather than continually refunding should be adopted. The uniformed investors who are misled should be advised of the facts.

Fourth. There should be a whole-hearted recognition of the right of the people to serve themselves with electricity if at any time they are dissatisfied with service through a private agency. The recognition of this right carries with it an implied duty to refrain from interfering with the free exercise by the people of their right to choose this course. Such an attitude may be represented by a quotation from the president of one of the large holding companies. Referring to his previous opposition to Government operation of Muscle Shoals, he said: "However, the President and the Congress of the United States declared that the policy of the Federal Government should be otherwise. Under the

COMPLAINANTS' EXHIBIT No. 839 (Excluded)

circumstances, we felt that policy and a due regard and respect for the judgment of those to whom the welfare of the nation had been committed, compelled us to permit the declared policy of the Federal Government to prevail."
[fol. 3683] These are the essentials of a new policy which the electric industry must pursue before it will be restored to a sound business basis and to public esteem.

TVA Press Release of April 25, 1934

"Catch"

John Zwinak spun an artist's ruler toward his friend Gene Davis, saw it caught and clutched by taut arm and hand.

So came to Zwinak the idea for the Electric Home and Farm Authority's appliance emblem—a flashing symbol of power, held by the hand of man, over the legend, "TVA Electricity For All."

Zwinak is a commercial artist on the staff of Young and Rubicam, Inc., New York agency working with the Electric Home and Farm Authority.

Once the idea was his, Zwinak reduced it to finished design, submitted it to Young and Rubican and to the Authority.

After Acceptance—Patent

The Electric Home and Farm Authority and its parent, the Tennessee Valley Authority, wanted assurance of absolute control over the emblem's use.

They called upon the Department of Justice, the Patent Office and the Library of Congress.

All cooperated. The TVA emblem followed the Blue Eagle on a record trip through the patent maze.

The patent makes certain that the emblem may be used [fol. 3685] only as the Authority permits. Its appearance on an appliance means:

(1) The appliance has been accepted by the Tennessee Valley Authority for financing by its subsidiary development agency, the Electric Home and Farm Authority.

COMPLAINANTS' EXHIBIT No. 840 (Excluded)

(2) It has been built to specifications assuring high quality at a minimum price.

(3) It is for sale in a locality served at TVA-approved power rates—rates cut to meet the Tennessee Valley Authority's standards of fair service and fair cost.

[fol. 3686] COMPLAINANTS' EXHIBIT No. 841 (Excluded)

TVA Press Release of April 26, 1934

Permanent displays of electrical equipment will be set up by the Electric Home and Farm Authority at Tupelo, Miss., Wilson Dam, Ala., Chattanooga and Knoxville.

President David E. Lilienthal announced the plans today.

Tupelo's display early in May will launch the first sales of equipment approved by the Tennessee Valley Authority.

The Wilson Dam exhibit will be an electrified home, an electrical center for the thousands of visitors to the dam and power house there.

Chattanooga's display will be in the James Building and will be made a center of electrical demonstration for the Chattanooga territory.

The Knoxville show room in the Arnstein Building will include an indoor reproduction of one of the houses built at Norris, the Tennessee Valley Authority's village near the dam.

A Norris house also will be built into the Chattanooga [fol. 3687] show room.

All the displays will be complete showings of equipment accepted by the Tennessee Valley Authority and by the Electric Home and Farm Authority, and stamped with the TVA emblem of low cost, high quality and cheap current—an upright arm and hand, holding a zigzag symbol of power.

The Chattanooga, Knoxville and Tupelo show rooms will exhibit some electrical wonders not ordinarily used in the home. There will be an "electric eye"—a photo-electric cell that translates light or heat into electrical energy, and finds a multitude of strange uses.

At Tupelo, the first equipment offered for sale with TVA approval will be shown with a general line of home and farm appliances.

COMPLAINANTS' EXHIBIT No. 841 (Excluded)

The Wilson Dam house will be a three bedroom house, electrified from basement to attic.

An electrical air conditioner will cool it in summer, heat it in winter. Electric range, refrigerator, dishwasher, water heater and smaller kitchen appliances will be there for cook and housewife.

Laundry equipment will be electrical. There will be other electrical aids for housekeeper or maid. In addition, the [fol. 3688] house will have an auditorium annex. Tourists may go there to rest, and to see and hear the electrical idea demonstrated.

Movies will show how electricity may be used in home, factory or on the farm.

Trained electric home specialists will tell how to get the most from home appliances.

Tupelo's display first will be in downtown quarters obtained for the sales demonstrations. The display will be made permanent later.

[fol. 3689] COMPLAINANTS' EXHIBIT No. 842 (Excluded)

TVA Press Release of May 16, 1934

Address by Arthur E. Morgan, Before The Lower Tennessee Valley Association, Murray, Kentucky, May 16, 1934

We are looking forward to the day when every hamlet will have its own power supply, at such a low rate that a very small factory can plug into the wall and go to work. We want power because power takes the drudgery out of [fol. 3690] life and makes industry possible. As you go over these hills in Tennessee, you often see an old mill race that leads half a mile to an old mill, which developed four or five horsepower. A lot of work had been done for so little power. Today you can buy a motor for $150 which will do that much work. I believe that one of the reasons why small industries have died out is that power was so expensive that it could be bought only by big units. If cheap electrical power had been available a hundred years ago, I doubt if the big units ever would have secured the hold on industry which they have.

COMPLAINANTS' EXHIBIT No. 842 (Excluded)

For about ten years there was a fight to prevent the power which could be generated in the Tennessee Valley at Muscle Shoals from being used for the people. Twice Congress passed bills providing for that power to serve the people. Twice they were vetoed. The third time the bill was passed as part of the Tennessee Valley Authority Act, it was sponsored by the President and supported by him.

I am not at all certain that the United States Government should make all the power to be made. I am not certain but what private utility companies are good things. I think I should be averse to having the Government take over all the [fol. 3691] power at the present time. I believe this reflects the President's attitude.

About a year and a half ago the President in speaking on the subject of power made this remark: "I believe we need a yardstick for power." What we pay for power represents not only the cost of the power itself, but sometimes it includes also the cost of watered stock. I might add that we sometimes pay for the cost of buying favorable decisions from public utility commissions. An example of that was seen in the case of Insull, who gave, off-hand, a present of a quarter million dollars to the judge who was deciding his case. The President said, "Let us eliminate such items. Let the Government make power and distribute it and sell it, and find out how much it actually does cost." I think the private utility companies should be enthusiastic about such a program. They know that they can develop power cheaper and they should welcome an opportunity to prove it finally.

The Tennessee Valley Authority expects their hearty cooperation.

We are trying to set up an accounting system so that everything will be open and above board. All charges are included—depreciation, maintenance, taxes—to give us a fair and honest comparison between public and private op- [fol. 3692] eration of utilities. The communities to which we sell power are required to do business in the same open way. Several months ago we made a contract with the city of Tupelo, Mississippi. For some months it has bought power from the Tennessee Valley Authority. It is now paying a little less than half what it was paying formerly. It distributes that power to its customers at a little less than half what they were paying formerly. Since the price of

power has come down, the use of it has gone up. People can now afford to use more. And I am happy to say that up to the present, the increase in the use of power has been enough that the city of Tupelo is paying all of its charges, its depreciation, its interest, its maintenance, its taxes, and is saving a few thousand dollars a month besides. The rate for power in Tupelo is three cents per kilowatt for the first fifty kilowatts. For the next 100 kilowatts, the rate is two cents. For the next 200, it is one cent. After that the rate is slightly less than one-half cent per kilowatt. At those rates Tupelo is making money selling power which it is buying from the Tennessee Valley Authority at about four mills. We believe that if we can distribute power to small communities at a price which people can afford, so that power will be no longer a luxury, the use of it will increase [fol. 3693] tremendously. We believe that there is now an under-consumption of power, due largely to excessively high rates.

The city of Tacoma, Washington, has owned its own power plant for forty years and has paid for it from charges made for electricity. The plant is completely paid for except for improvements made in the last five years or so. Its rates are about the same as those which the city of Tupelo is charging: three cents for the first 100 kilowatts and two cents for the next 200, and then one cent. At those rates the city of Tacoma has built a great power plant, paid for it, and the people are using two or three times as much power as is used in the city of Knoxville, a city of about the same size, where the cost is twice as great. We hope soon to serve Knoxville with our power and expect the use of power to increase as a result of the lower rates which will be charged.

In the Tennessee River Area, the river drains about 40,000 square miles. There are thousands of miles of water courses. The fall from the high power plants in the mountains to the Ohio River is over 2,000 feet.

There are two kinds of power plants possible in the Tennessee Valley. One is what is called a run-of-the-river [fol. 3694] plant, one in which there can be very little storage. The water must be used as it comes down the river. The plant at Muscle Shoals is of this kind. When the river is low and little water runs through, there is little power de-

veloped. When the river is high and there is a great deal of water running through, there is a great deal of power. Last summer during the dry months the river was so low at Muscle Shoals that we could get only 25,000 kilowatts, about 35,000 horsepower. In a wet winter, we can develop as high as 600,000 kilowatts—nearly twenty-five times as much. The variation from high to low is too great.

Operation of the Muscle Shoals plant alone would not be profitable. The cost of making the power is too much. Power is valuable only when it is dependable. Dependable power, or prime power as it is called, is worth five or ten times as much as secondary power. No one would care to buy power from a firm which should say, "You may have the power in the winter, but not in the summer and fall." Power is valuable chiefly when it is available the year round.

At the headwaters of the river, there is a different situation. We are building the Norris Dam on the Clinch River. [fol. 3695] There is great storage space behind the dam. The dam will be 253 feet high and the reservoir will store almost a whole year's flow of the river. By using that dam and its storage reservoir together with the dam below, we have a very different picture. For example, Muscle Shoals ran down to 25,000 kilowatts last summer. If Norris Dam had been operating with it, we should have saved the water at Norris during the wet season when there was plenty of water in the Tennessee; then in the dry season, when the Tennessee was low, we should have released the water at Norris and let it run down the river to Muscle Shoals. We could have raised the 25,000 kilowatts to about 100,000 kilowatts last summer, making four times as much power because of the water let down from Norris Dam. We could use the whole supply stored at Norris Dam at Muscle Shoals in the months the water is low, making power both at Norris Dam and as the water goes down the river again at Muscle Shoals, and at any other dams which may be placed down the river.

Now suppose there are eight dams on the river. At every one of these, the water from Norris Dam will make power again. It is this joint operation that makes it worthwhile to build the dams. Any one might be too expensive alone. The [fol. 3696] power generated at Norris alone would not be worthwhile but when the water can be used eight times

more, it becomes a profitable development. There is room for about a dozen large dams on the headwaters of the Tennessee, dams that will store vast amounts of water. If we can build these dams to store the water, we can almost even out the flow of the river, making every dam on the Lower Tennessee worth three, four or five times as much at it would be worth if it had the natural flow of the river only.

The Tennessee River System, therefore, should be developed as a whole, under one management. Suppose the dams were built under different managements. For example, the Aluminum Company of America has a dam on the headwaters of the Tennessee. It uses its water when it needs power to run its plant. It may use the water in winter, the wet season, when there is already enough in the river, and shut it off in summer when the water is most needed below. If that dam were a part of one unified system, that water would be used when it was most necessary, taking the river system as a whole. The upper plant would be more valuable because its power could be used when it was most necessary; the lower plant would be more valuable because it could be supplied with water when it most needed it. The two plants operated together will be worth perhaps [fol. 3697] three times as much as they would be worth if operated separately.

It would hardly be fair for the Government to go to the expense of building these great dams up on the headwaters, then to get no benefit from them at the dams down river. There must be unified control. In the midsummer, then the Tennessee River is low, little power at the Aurora Dam, for instance, in Southwestern Kentucky, could be developed. At another time of the year, when the Ohio River flooded, the water from it will back up to Aurora Dam and there will be little fall there to develop power. Thus, both in high water season and in low water season, Aurora Dam would be unprofitable alone. But it will be tied to other dams, with transmission lines to carry current. In the low water of summer, the dam will be supplied with water by the storage dams up river. In the high water of spring, it will be supplied with power by transmission lines from the up-river plants with which the Ohio does not interfere. Thus, in both high and low water seasons, the Aurora Dam

COMPLAINANTS' EXHIBIT No. 842 (Excluded)

will be worth more by operating it with the other dams than if it were run alone.

For this it is necessary to have government control. If the dams were privately owned, no one could compel the owners below to buy power from those above. No one could [fol. 3698] say, "We are going to let water down, and your charge will be so much." The only way for the full development of the river system is to operate the whole as a single organized unit with unified control. With transmission lines connecting these dams, we will have a system of far greater value to the community than if the dams were operated independently of each other. Every dam built on the headwaters will be partly paid for by the dam down the river, which will furnish a market for the stored water. * * *

Some time ago I talked to a group of our foremen. They know that no private company is making money out of this job. They know that there will be no dividends—that we are making power so that people may buy it cheaper. The men feel this too; they are being treated well, paid well, and they will deliver the goods and see the President through. That kind of spirit will build dams and power plants, and will build a country with a prosperity which will be permanent.

[fol. 3699] COMPLAINANTS' EXHIBIT No. 843 (Excluded)

TVA Press Release of May 17, 1934

The Tennessee Valley Authority and the Investor

Remarks of David E. Lilienthal, Director and General Counsel, Tennessee Valley Authority, Before the National Association of Mutual Savings Banks, New York, May 17, 1934—Hotel Waldorf Astoria

The protection of the investor is a matter of immediate concern to your national Government. As you know, the President, on several occasions, has expressed his views upon this subject. Under his leadership legislation has been enacted, and other legislation is pending, designed to protect the investor. The credit agencies of your Government have fought a gallant battle for the institutional investors. Other federal departments have been working to the same end.

COMPLAINANTS' EXHIBIT No. 843 (Excluded)

In common with these national agencies, the Tennessee Valley Authority, within the sphere of its own operations, is likewise committed to a policy of protection and of fair play for the investor. You know, I believe, in a general way at least, that the duties of the Tennessee Valley Authority [fol. 3700] encompass a wide field in the planned development in seven states of an entire river watershed. It is particularly in connection with the power program of the Authority that the problem of justice to the investor arises.

In discussing the power policies and plans of the Tennessee Valley Authority, it seems to me important that we first consider the position of the institutional investors in the electric industry as a whole.

The savings banks, the insurance companies and fiduciary institutions of various kinds supply a major portion of the capital for this extensive industry. This capital is secured at a very low interest rate. The senior securities of well-financed operating utilities yield a rate of return comparable with that of municipal bonds. These senior issues have been generally regarded as attractive by investment bankers and have been widely recommended for bank and trust fund portfolies. But in the face of the fact that these institutional investors have supplied billions of capital to the electric utilities at a low return, the voice of the senior security holder has rarely been heard in the management of public utilities properties. The fate of billions of dollars of senior securities is determined by the policies of a small [fol. 3701] management group holding but a negligible fraction of the common stock, and with little of their own money at stake. I need not go into the legal and financial reasons for this state of affairs. For our purposes the fact is the important thing.

The almost insatiable need for new capital in this great business of electricity you have supplied, in major part—you of the savings banks, the insurance companies, the trust funds. The fate of your billions of conservative capital has been put into the hands of a managerial minority. Have they justified your trust and confidence? We all know that some have, and their record is a matter of pride to business men everywhere. But these bright spots are not typical. The record of these management groups as a whole is not creditable.

COMPLAINANTS' EXHIBIT No. 843 (Excluded)

The record shows that important common stock management groups have in effect been steadily confiscating senior security values. Your investment has been sapped in a variety of ways. One of these I can illustrate by reference to certain prosaic documents I hold in my hand. These pamphlets are the annual reports of the directors of two outstanding electric operating properties—Commonwealth Edison Company and Public Service Company of Northern [fol. 3702] Illinois, for the years 1932 and 1933. These properties operate in one of the richest territories in the country and under most favorable conditions. I have no doubt that there is hardly a savings bank represented here whose depositors have not contributed heavily to the senior capital of these excellent businesses.

Turning first to the consolidated surplus account *fo* the Commonwealth Edison, on page 19, we find that the directors of this company in a single year found it necessary to write off over $45,000,000 against surplus, reducing the surplus from $53,500,000 to $6,900,000. Some of the items in this write-off against surplus deserve your attention. In the first place we find a so-called investment reserve of $30,000,000 set up. It appeared that the management of this company through a non-utility investment subsidiary had been making enormous outlays in all manner of enterprises, from truck factories to suburban real estate, investments which everyone here would agree no conservatively operated quasi-governmental business should have considered. The reserve was to absorb the losses of those ventured. Even that investment reserve was found inadequate, for in the 1933 report we find an additional charge of $7,000,000 against surplus to care for shrinkage in value of the so- [fol. 3703] called investments of the subsidiary. Some of the other items in this surplus account are interesting. Here is an item of $3,750,000 for "losses in connection with transactions in company's re-acquired stock." This company, through its subsidiary, was engaged in the practice of buying the company's stock in the open market, for purposes which do not stand very close scrutiny, when taken in connection with the management's intensive stock selling campaign among customers and helpless employees. Then there is an item of $1,665,000 for "advances and loans of

stock to officers and employees and to individuals connected with affiliated companies."

Let us turn now to the annual report of the Public Service Company of Northern Illinois. Here we find that in 1932 and 1933 the management wrote off a total of $18,500,000 to take care of the shrinkage in value of securities in all manner of outside enterprises, similar to those of Commonwealth Edison. Charges against the reserve included a half million dollars in advances and loans to officers and employees and to individuals connected with affiliated companies, and $1,730,000 in connection with losses in stock market operations involving the company's own securities. [fol. 3704] I need hardly point out that I am not criticising the write-offs put into effect by new management, but rather the financial policies extending over a period of years which made that action necessary.

These reports tell a story of confiscation of values of senior securities. Furthermore, the effect of this management policy has been to make rate reductions much more difficult for these companies, and to that extent has made the general public relations of these companies less favorable. All of this reacts adversely to the holders of bonds.

I wish these were the only instances in which senior security values have been confiscated by management policies. You and I know that the instances are legion. Another common method of confiscating senior security values has been through the abuse of the management and engineering fee. By this device the common stockholders of an operating company were able to draw off not only a generous dividend on their stock holdings, but additional compensation for alleged services. Grossly inadequate provision for depreciation, resulting in over-statement of income, followed by an excessive payment of dividends, frequently out of capital, has been another method whereby many an unfaithful or speculating management has [fol. 3705] siphoned out the assets of operating companies while your senior securities suffered. The records contain instance after instance of such confiscation of values.

Some of the more flagrant abuses in the industry have recently been revealed to the investing public through the instrumentality of federal agenies. These revelations have aroused general public condemnation. From certain quar-

ters purporting to be independent, but actually associated with management groups we are told that the industry's ills arise from the various activities of the Federal Government and of regulatory commissions. An honest, dispassionate analysis fails to sustain this charge. Where investigations of utility affairs disclose illegal and unsound practices the Government has not hesitated in making such disclosures known to the consuming and investing public. Nothing less than this would discharge your government's duty to protect the investor. The preservation of investment values demands that corporate structures be soundly established, that abuses be revealed, and that physical and financial operations be correctly reported to the public.

The electric industry has grown at a rapid rate and is destined to continue to grow. Further growth will require [fol. 3706] fresh capital. Fresh capital will be forthcoming from the public only to the extent that it is convinced that the industry is managed in accordance with high standards. If the private utilities are unable or unwilling to clean the slate, they will find it very difficult to convince investors to risk further capital in this essential business. In the national Government's attempt to curb holding company abuses, to assure honesty of accounting, to simplify corporate structures, and to achieve security in fact for investors the Government is working in the long-range interest of all. If the industry, or any of the groups which have an interest in it, oppose this constructive program, it may find itself in a position where it will be difficult to secure fresh capital for the expansion which lies ahead.

By 1933 the management of some of our major electric utilities had become a national scandal. It was inevitable that President Roosevelt and the Congress should squarely face this situation. It was inevitable that they should see that regulation alone was inadequate to fully protect either the consumer or the investor. It was plain to all that regulation needed strengthening and needed supplementing.

Neither the industry nor the investors took effective action to meet this situation. The President and Congress, [fol. 3707] in setting up the Tennessee Valley Authority, were merely responding to an overwhelming public sentiment. The public, investors and consumers alike, demanded an experiment on a broad scale, of public electric operation.

COMPLAINANTS' EXHIBIT No. 843 (Excluded)

This development was designed to serve as one means of seeking to prevent a continuation of financial and operating practices which had brought discredit on the entire industry, sound and unsound managements alike.

As institutional investors, you will be interested principally in those plans and policies of the Authority which most directly affect the investment quality of the securities of the electric industry.

The Authority is under duty to acquire a market for its power. It is authorized to compete with existing utilities, and for this purpose is expressly empowered to erect duplicate facilities. But no competing facilities have been constructed, and I am authorized to say that under its present Board none will be constructed, until every reasonable alternative has been exhausted. The Authority, in public and in private, has urged this same principle of reasonableness upon municipalities in its area.

Last August the Authority made the following declaration of policy:

[fol. 3708] "Every effort will be made by the Authority to avoid the construction of duplicate physical facilities, or wasteful competitive practices. Accordingly, where existing lines of privately-owned utilities are required to accomplish the Authority's objectives, as outlined above, a genuine effort will be made to purchase such facilities from the private utilities on an equitable basis."

This policy the Authority is determined to carry into effect. On January 4, 1934, after months of negotiation a contract was entered into between the Tennessee Valley Authority and the four major operating companies of the Southeast, members of the Commonwealth and Southern system. Under this contract the Authority agreed to refrain from competing with the Commonwealth and Southern companies in certain areas, and the companies agreed to sell their properties in these areas at a price reached by negotiations. A complete interchange arrangement was effected which ties these two systems together as two private utilities would be tied together. The contract calls for cooperation between the parties in working out a program to further increase the use of domestic electricity. This contract is concrete evidence of the Authority's desire to avoid con-

COMPLAINANTS' EXHIBIT No. 843 (Excluded)

[fol. 3709] structing duplicating facilities or to engage in destructive territorial competition.

To avoid duplication of facilities, to avoid territorial competition, to buy property at fair prices, are cardinal policies of the Tennessee Valley Authority. Our adherence to these policies should reassure you of the Authority's determination to respect prudent investment in useful property.

But more important still to you as institutional investors in this great industry is the program under way to increase the use of electricity for domestic, rural and industrial purposes. This project of the Authority, created by order of the President of the United States, and backed by a million dollars of capital and ten million dollars of credit, is being launched next week throughout the Valley. This undertaking holds great promise for the stabilization of earnings for this whole industry. For obviously if the experiment is as successful in the Tennessee Valley as experienced private utility operators predict, then it can be adapted to other sections of the country.

By direction of the President the Authority has established an agency known as the Electric Home and Farm Authority. This corporation will make possible the sale [fol. 3710] of low cost appliances to a large portion of the population which hitherto could not afford complete electric service in the home. These appliances of course, are made by leading manufacturers and sold through the regular dealer outlets. The EHFA is extending these load-building facilities, not only in the territory of its own operations, but also to the territory served by the extensive Commonwealth and Southern system and other privately-owned utilities which desire to cooperate. The Authority is interested not merely in the expansion of its own electric sales; it is interested in increasing the consumption of electricity throughout the South, in disregard of public or private ownership. We are entering upon a program of technological research which may yield important results in uses of electricity for both domestic and industrial purposes. This program will result in expansion of output and in stabilization of the industry as a whole. It cannot therefore fail to be of interest to you as investors.

COMPLAINANTS' EXHIBIT No. 843 (Excluded)

Public policy and business policy point to the utility industry as a principal repository of the conservatively invested funds of the country. The industry has all the characteristics which should commend it to the conservative [fol. 3711] investor. It is public in its nature, even enjoying the power which only the sovereign state enjoys—the power of condemnation. It has stability. In spite of the financial mayhem committed upon it, its earnings record through the depression is remarkable. It furnishes an essential commodity. It enjoys almost complete protection against territorial competition. It is a matter of national importance that an industry so intimately related to the public welfare should be so operated as to make it a safe repository for the funds of great institutions, such as your Mutual Savings Banks.

There is no basis for the hysterical cries of those who see, or pretend to see disaster ahead for the electric industry. Can it be that they are deliberately trying to depress the prices of sound senior securities, so that they can be bought in at hysteria prices? This may be a subject which would merit investigation by public agencies, and perhaps by senior security investors, such as the Association of Mutual Savings Banks.

We have been given a national power policy to execute in the Tennessee Valley. It is intended to serve as a demonstration and an experiment. It answers an overwhelming public demand, after a decade of experience injurious [fol. 3712] to both investors and consumers. Under this new policy prudent investment in useful property will not only be respected but protected. We believe that this limited operation of a public power system will set up a precedent of trusteeship in this business which will have a sound effect upon the financial policies of private utilities, and will work to the advantage of the institutional investor in this great industry.

TVA Press Release of May 18, 1934

Address by Dr. Arthur E. Morgan Delivered to the Civic Clubs of Huntsville, Alabama, May 18, 1934

People of Northern Alabama: • • •

Let me give another example of what planning could do. The Tennessee River is one of the great power possibilities of eastern United States. Only west of the Rockies or along the St. Lawrence are there any sites superior to it. It is possible to develop several million horsepower of energy on the Tennessee River. The development of that power will depend to a considerable extent upon the planning of it. If the various power projects are developed independently of each other, the development will be only a fraction of what it will be if a single unified plan can be carried through. Let me give an example. The Muscle Shoals Dam down here is a great piece of masonry. Only three or four dams in the world have as much concrete in them as the Wilson Dam at Muscle Shoals. That dam, taken by itself, is not a good investment. It is not a good investment because it is on a river that fluctuates very much between low water and high water. Last summer during the low water season, there was only water enough in the Tennessee River at Wilson Dam to develop about 25,000 kilowatts. In some wet winters we have had enough water to develop 600,000 kilowatts or twenty-five times as much. That is the extreme fluctuation of the river.

There is no storage to speak of at Wilson Dam. You [fol. 3714] must take the water as it comes, and taken alone it is not a good investment. Power is good only if it is reasonably continuous. This is not exactly true, but roughly, valuable power is what is called dependable power or prime power. If a man wishes to buy power to run his factory, he doesn't want to buy power which he can have only certain months of the year, but he wants power that is dependable throughout the year. Therefore, prime power is worth five times as much, perhaps, as secondary power which comes only during the wet season. That is why Muscle Shoals alone is not a good investment. We have another dam we are building on the Clinch River—Norris Dam. Taken by itself, that dam is not a good investment. There is

a great storage behind it, about enough capacity to store a year's rainfall on the river. But it is expensive to build that dam. Speaking from memory, as I recall, it will cost about $240 per kilowatt to develop that power, taking it by itself, as against perhaps $80 per kilowatt to build a steam plant. So Norris Dam alone could not be compete with steam plants. But when you take Norris Dam above and Wilson Dam below and make one operating unit, you have a different situation. During perhaps nine months in the year (I speak generally because years are not alike) there is an abundant [fol. 3715] flow at Wilson Dam, enough to develop possibly 200,000 kilowatts. Then for a period in the late summer and fall, the river runs very low. Now suppose at Norris Dam, instead of taking the water as it comes, we saved it during high water when there is an abundance. Then, along in August, when the Tennessee River is low, let the water out at Norris, put it through the plant at Norris and make current there when it is most needed. But not only that—the water will go on down to Muscle Shoals and make power over again. You may use the entire year's flow in three months and that is enough to fill in the gap at the low water time, so that at Muscle Shoals you have three or four times as much dependable power as you would without Norris. Together they are profitable; alone they are not.

It is not only Wilson Dam that Norris will help. There is already a dam at Hale's Bar, owned privately. The building of Norris Dam will make it worth three times as much (speaking in rough figures—I would like to have my figures checked) because of the regulating influence of the reservoir above. Private capital built that lower dam and under present condition private capital would have a gift of, say, 300 per cent at government expense. Then the water [fol. 3716] will come to Wheeler Dam and make it worth two or three times as much.

There is room for possibly eight dams on the river, and the water from Norris, if properly handled, will multiply by about three (speaking roughly) the value of them all. When you take that into account, you find what a profitable development you have in the Norris Dam. But that is not the only up-river dam. On the Holston, the French Broad, the Hiawassee, the Little Tennessee, there are great storage

possibilities. If we took advantage of all, we could even smooth out the flow and get almost a uniform power load throughout the year. When there is a great deal of rain, and the smaller tributaries of the Tennessee are full of water, the reservoirs will be shut down, and during dry season, the water will be let out. I believe it is safe to say that if the Tennessee River can be developed as a single unified development under one ownership and one control, hydro-electric power may cost not more than half as much as if it were developed in independent units. Now someone may say that this could be worked out by private ownership—that the private companies could agree about trading their power. That is no answer. Take the Norris Dam, for instance. It would not pay to build it in the hope that some-
[fol. 3717] body might wish to buy its power in the future. It is not justified unless you can count on a market. That is true for other up-river dams. Suppose that they are owned privately and a factory on the Norris Dam is making some large product. The factory gets orders and runs when it gets orders. It may run in winter when there is plenty of water and shut down in summer when the lower plants need the water. You can only develop the full possibilities of the up-river dams by knowing you can get the water paid for at other dams down river. Therefore, the very building of the dams must be by some coordinated power. On one of the branches of the Little Tennessee, there is a dam owned by the Aluminum Company of America. That dam stores water and uses it when it has business for their industry. Now they let the water out when they need it not when we need it at Muscle Shoals. They are working for the Aluminum Company of America, so they regulate the power to suit themselves and not to suit the dams down stream. I believe that the way to get maximum value is to operate under unified ownership and control.

The cost of hydro-electric power is more important than you may think. With recent developments of steam generating plants, steam power is competing with water power. A good many power men will tell you the day of water power [fol. 3718] is passed,—that from now on steam plants will be built. If they must go back to operating unorganized, uncoordinated plants that may be true. But if we can carry this through as a single organized development, then we

can make this power cheap enough so that I believe we can very well compete with steam power, and it may be that the industries of the Tennessee Valley in the future will depend upon whether this is developed in a unified way or whether it is developed in isolated and non-cooperating units. We are building with a view to the future.

Let me go into the matter of water power. It is probable that for a long time to come a very considerable part of the electric power of America will be generated by steam. There are not enough power plants to go around, and their situations are not right. We must depend upon steam plants. Coordination is not so necessary in steam plants—it is desirable, but not so necessary. The President has expressed himself on the electric power issue. He has said very clearly that he is not in favor of having the U. S. Government generate and sell all the power in the country. He said he believes it is wholesome for our country to have private ownership of utilities to a considerable degree, but [fol. 3719] he believes that private ownership has not always exercised a spirit of responsibility to the public. We cannot tell just when that spirit of responsibility is being exercised and when it is not. The affairs of private utilities companies are not given freely to the public. Only now and then does a window open and do we get a look inside. In the case of the Insull utilities, you know the mess that was there; what a horrible mess and jumble of over-capitalization it was—holding companies of holding companies piled ten deep. You know how the underlying securities had been taken for holding companies to gamble with their own securities. An infernal mess it was.

It should not be said that the Insull companies were representative of the utilities of the U. S. I do know, however, that I have talked with Mr. Insull and that two years ago, he spoke with righteous indignation of the abuses. He spoke of the crying conditions in the handling of utilities, of the need for conscientious good judgment. I have discussed the subject with him and heard these expressions of righteousness from his own lips. One of my associates—I do not mean one of the directors of the TVA but another associate—was engaged for a time as an accountant, auditing the books of one of the large utilities. He gave up the [fol. 3720] job because he did not care to be in such a busi-

ness. He expressed his personal opinion that there is at least one other large organization in America which would compare in its management with the Insull companies. I am not certain but what there are others that would look somewhat the same if all the light were let in.

There are different kinds of management. Some of the companies are run with honesty and could show all their affairs to the public. In our own dealings, we have found decided differences of openness and fairness. There are some companies with which we could deal as with business men, with nothing to hide. Some are not open and above board. The President feels that in some way we should have an opportunity to know what power actually does cost. He has thought it would be a good thing to have a yardstick for power. One of his purposes in recommending the establishment of the Tennessee Valley Authority was to create a power yardstick. If the government can have a power project comparable in size to other power projects and can keep their accounts open and above board where everyone can see them, with *a* standard accounting methods and everything taken into consideration, we can begin to find out, first, whether the government can handle business [fol. 3721] efficiently; and second, if it can, what is a fair price for power?

We can argue about this for a long while. Perhaps a case will help us to settle the question. So we are in the power business. We have Muscle Shoals and Wilson Dam in operation. We are building two more dams—Norris and Joe Wheeler. We are already selling power to some extent, and I may say that in working with the power organizations in this region, we have found them cooperative. We have found a willingness to work along with us that has not been evident in certain other areas. Mr. Lilienthal has mentioned from time to time his pleasant experience in cooperating with the utilities in this region. We feel that we have been treated with fairness in agreeing with them. They may not want us in the power business, but since we are in it, we have found cooperation. We are selling power wholesale where we can. We have contracts with a number of communities to furnish power for them to retail. It takes quite a while to overcome all the obstacles when we try to work out such a contract. You have heard

COMPLAINANTS' EXHIBIT No. 844 (Excluded)

of our contract with the city of Tupelo, Mississippi, the first contract we made. Under our power contract with Tupelo, we sell them power for a little less than half what [fol. 3722] they were paying formerly. The city is retailing that power to its customers for a little less than half what the customers were paying formerly. The rates at which Tupelo sells power are about like this: 3 cents for the first 50 kilowatt hours; 2 cents for the next — kilowatt hours; 1 cent for the next 200 and after that the rate is 4 mills. (I am speaking from memory. This is in Mr. Lilienthal's field; he directs power development of the program; Dr. H. A. Morgan directs the fertilizer and agricultural program; and I am charged with the building of the dams and the general engineering projects, also the general supervision of the staff.) So the average cost for domestic use would get down as low as ¾ cent if a person would use about a thousand kilowatts.

It has been said that we have left the city of Tupelo to hold the bag—that we are selling the power at a reasonable wholesale price, but that the city will lose out in retailing it. We do not believe this is the case. Up to the present the city of Tupelo is keeping books as we have required. We have required the books to be kept in a certain way, using certain funds for operation, setting aside funds for amortization, for paying off the bond issue. Certain funds are set aside for depreciation, for surplus; and when these are taken care of, funds are set aside for taxes so that the [fol. 3723] plant will be paying regular taxes. All these things have been done. Last month, I think, for the month, the city had a margin of about 3,000, and this is a town of about 10,000 people.

TVA Press Release of May 18, 1934.

The First Year of the TVA

(A Summary of Activities by the Tennessee Valley Authority From May 18, 1933, the Date of the Signing of the Tennessee Valley Authority Act, to May 18, 1934)

The close of the first year of the Tennessee Valley Authority sees Wilson Dam in "yardstick" operation, an ex-

tensive electrification program launched in Mississippi, Alabama and Tennessee; the Norris and Wheeler dams one-fourth completed and four additional dams projected; a $7,000,000 transmission line under way to further link these new sources of power; a demonstration fertilizer plant nearly completed at Muscle Shoals, and the great Tennessee River basin under the unified and planned control that President Roosevelt had in mind in creating the TVA.

Begun four months after the TVA directors held their initial meeting, the $34,000,000 Norris Dam, on the Clinch River near Knoxville, is now two months ahead of schedule. This great storage dam will be 253 feet high and 1,800 feet long, and impound 3,600,000 acre-feet of water with a shore of 800 miles. The $20,000,000 Wheeler Dam, 15½ miles [fol. 3725] above Wilson Dam in Alabama, will raise a 50-foot barrier 6,000 feet across the Tennessee River, backing its waters for a distance of 80 miles. Not authorized until October 13, 1933, Wheeler Dam operations proceeded so rapidly under the TVA organization, which by that time had been perfected, that unwatering the first cofferdam began exactly eight weeks from the day the first timber was driven. These dams will regulate the flow of water on the upper Tennessee and thereby increase the prime power of Wilson Dam, besides aiding navigation and flood control.

As a part of the development program for the entire river system, the Authority is surveying and doing other work preliminary to constructing run-of-the-river dams at Aurora, on the Tennessee-Kentucky border some 44 miles above the point where the Tennessee joins the Ohio, and at Pickwick Landing, in southeastern Tennessee near the Mississippi-Alabama line; a storage dam on the Hiwassee River, which empties into the Tennessee above Chattanooga, and supplemental impounding barrier somewhere on the French Broad River in the mountains of northeastern Tennessee.

Besides adopting a power policy and establishing rate schedules, the Authority has put into effect rules and regula- [fol. 3726] tions governing sale of its power. On October 27, 1933, it signed its first power contract with Tupelo, Mississippi. Since then it has entered into contracts to serve 11 other municipalities—Knoxville and Pulaski, Tenn.; Amory and Corinth, Miss., and Muscle Shoals, Florence, Athens, Sheffield, Tuscumbia, Decatur and Russellville, Ala.

COMPLAINANTS' EXHIBIT No. 845 (Excluded)

After three months of negotiations, the Authority acquired extensive private facilities in Mississippi, Alabama and Tennessee for initial distribution of Muscle Shoals power to as many as possible of the more than 200 municipalities which have applied for such service to date; has induced privately-owned utilities elsewhere in the area to make substantial rate reductions, and in northeastern Mississippi is embarked on the Government's first rural electrification program.

In popularizing the use of electricity, the TVA is aided by the Electric Home and Farm Authority, a supplemental corporation created by Executive Order of December 19, 1933. In cooperation with manufacturers and retailers, the EHFA on May 1, made low-cost electrical appliances available on long-term credit to Valley residents.

[fol. 3727] COMPLAINANTS' EXHIBIT No. 846 (Excluded)

TVA Press Release of May 21, 1934

Text of Addresses Delivered by Directors of the Tennessee Valley Authority over NBC Stations on May 21, 1934

Another issue is unified river control. The Tennessee River can be made to yield millions of horsepower, but if the various power plants are the unrelated work of "rugged individualism", there will be an enormous waste of power. For instance, if the power plants at Norris Dam and at Muscle Shoals are operated together, they will be worth more than twice as much as though they should be operated separately. The Tennessee River developed and operated as a unit can produce hydro-electric power at half the cost of unorganized development, with valuable by-products in flood control and navigation. Our nation must not suffer the waste which lack of planning of this great river system would cause.

At present two great dams are being built as part of this unified program. In the construction of the Norris Dam on Clinch River, and of the Wheeler Dam above Muscle Shoals on the Tennessee River, very rapid progress at very low cost is demonstrating that the Government can work with efficiency and economy. My fellow director, Mr. Lilien-

COMPLAINANTS' EXHIBIT No. 846 (Excluded)

[fol. 3728] thal, will discuss the power program of the Tennessee Valley Authority. • • •

By David E. Lilienthal:

Almost all of you who are listening in on this program of the NBC tonight have electricity in your homes. But the average household makes only a very limited use of electricity. The full benefits of electricity are enjoyed only by a few.

Electricity can relieve the women in twenty million American homes of much of the drudgery of housework. Electricity can make the home more comfortable and convenient. It is part of the job of the TVA to make electricity more widely available, to work out means whereby its full benefits may be enjoyed in the home of modest income. In the few remaining moments of this program, I want to tell you what we are doing toward this end in the Tennessee Valley.

Three barriers have stood in the way of a wider enjoyment of the benefits of electricity. First, the rates for service have been too high. The second obstacle has been the price of electricity-using equipment, such as ranges, refrigerators, water heaters, and other large appliances. And the third barrier has been a lack of knowledge of the mani- [fol. 3729] fold benefits of the electric home, and an understanding of all the ways in which electricity could be the servant of the average household.

The Tennessee Valley Authority is hard at work on a program to remove these three barriers to a wider use of electricity in the average home—the barrier of high rates, of high appliance costs, of inadequate knowledge of the uses of electricity. This program I can best describe by telling you of a concrete situation.

Down in northeastern Mississippi there is a remarkable little city of some 7500 people which will go down in history as the place where the average man and woman first really made full use of electricity. Tonight in the city of Tupelo these people are using current from Muscle Shoals supplied to them through the city's own electric distribution system. The TVA rates in effect in that city represent a reduction of sixty per cent. In April the homes of this town used fifteen per cent more; the stores used twenty three per cent more; the average use was thirty-five per cent more than a year ago.

COMPLAINANTS' EXHIBIT No. 846 (Excluded)

The people of Tupelo are demonstrating the TVA's point that really low rates will produce a tremendous increase in use, and is therefore not only socially desirable but also good business.

[fol. 3730] But unless these people in Tupelo who have a moderate income can buy electric appliances, the low rates will benefit them only in a limited way. Lower prices for standard quality electric home equipment are being worked out through an agency of the TVA established by order of the President. It is known as the Electric Home and Farm Authority.

With the cooperation of the leading electrical manufacturers of the country, the dealers, and the electric utilities, this agency has made it possible for housewives to own electric ranges, refrigerators, and water heaters at prices from twenty-five to thirty-five per cent lower than those heretofore prevailing. The increased volume of sales will result in a fair profit to the manufacturers and retailers, and a great benefit to the consumer as well.

The third point in the program—more complete knowledge of the uses of electricity—is being carried out in Tupelo this week, in the form of demonstrations in the best use of this great national resource. The home economics departments of the city, state and national governments are cooperating with TVA in aiding the housewife to learn what electricity can do to make her work less of a burden and her home more comfortable.

TVA Press Release of January 22, 1935

Tennessee Valley Authority, Knoxville, Tenn.

What TVA Means to the Retailer

Advance Text, Remarks of David E. Lilienthal, Director, Tennessee Valley Authority, Before a General Session of the National Retail Dry Goods Association Annual Convention, January 22, 1936, 10:30 A. M., Hotel Pennsylvania, New York. * * *

One purpose of our sales is, of course, to help liquidate the investment which the Federal government has made in

COMPLAINANTS' EXHIBIT No. 847 (Excluded)

dams and other structures. But in addition, Congress specifically instructed TVA, in selling this power, to encourage increased use especially for domestic and farm purposes. This, we felt, could be done in only one way—by breaking the old stale-mate of high rates and low consumption and starting off with genuinely low rates, rates so low that they would bring about the increased use and lowered unit costs needed for successful operation.

To this end, our contracts with municipalities and co-[fol. 3732] operative associations contain not only a schedule of wholesale rates, but also the rates which the retailers agree will be charged the householder. These are often called TVA yardstick rates. These rates are low, though still not as low as we hope they may yet become. • • •

The publicity accompanying the launching of the TVA program aroused public demand for electric service. The Electric Home and Farm Authority, now on a national basis, assisted by providing lowered prices and easier finance terms for major electric equipment.

Similarly with electricity, the yardstick rates were designed to be low enough to produce volume, and they have done the job. Their influence is felt all over the country. • • •

[fol. 3733] COMPLAINANTS' EXHIBIT No. 848 (Excluded)

TVA Press Release of December 30, 1935

Advance Text, Remarks of David E. Lilienthal, Director, Tennessee Valley Authority, at the Annual Meeting of the American Historical Association and the American Political Science Association, Chattanooga, Tennessee, December 29, 8.00 P. M. • • •

In other words, the first duty of the TVA Board with respect to the surplus of power not used for government purposes is to sell that power, and use the revenues to help pay the operating costs and repay the investment in the project.

The Board has a duty to secure revenues. But in securing those revenues, the widest possible use of electricity, particularly in homes and on farms, is specifically laid down

as a policy to guide the Authority. Though the project must plan to support itself, the national policy is clearly one of maximum use, consistent with reasonable costs, not maximum financial returns. Some of the statutory language is unusually interesting and worthy of your study:

"The policy is further declared to be that the projects [fol. 3734] herein provided for shall be considered primarily as for the benefit of the people of the section as a whole and particularly the domestic and rural consumers to whom the power can economically be made available, and accordingly that sale to and use by industry shall be a secondary purpose, to be utilized principally to secure a sufficiently high load factor and revenue returns which will permit domestic and rural use at the lowest possible rates and in such manner as to encourage increased domestic and rural use of electricity."

In an interesting provision which I quote from Section 10, the statute expressly recognizes and emphasizes the deep social implications of electricity:

"That the Board is hereby authorized and directed to make studies, experiments, and determinations to promote the wider and better use of electric power for agricultural and domestic use, or for small or local industries, and it may cooperate with State governments, or their subdivisions or agencies, with educational or research institutions, and with cooperatives or other organizations, in the application of electric power to the fuller and better balanced development of the resources of the region." • • •

The component costs of producing and distributing electricity were to be recorded in such a way that they would [fol. 3735] form a useful and challenging basis of comparison—a yardstick of comparison—with costs in private and public operations in various parts of the country. In using such a yardstick of costs, due weight must, of course, be given to the underlying variables which affect every fair comparison of costs and rates.

But the yardstick is by no means a yardstick of costs alone. What TVA is doing on several fronts, pursuant to statute, furnishes equally useful yardsticks: for example,

yardstick of mass consumption (about which I shall speak in detail in a moment); a yardstick to determine whether good wages and superior working conditions will result in low unit costs in construction; the extent to which electricity on the farm can be so used to increase the farmer's income; a yardstick for the integrated control of waters throughout an entire major watershed. • • •

In the contracts with municipalities for sale of bulk power not only the wholesale rate but also the rates the city will charge the ultimate consumer that are usually referred to as TVA yardstick rates.

I am not going to take you into an involved and lengthy discourse on the theory of price and cost in the field of electricity. But one principle of pricing must be clearly [fol. 3736] recognized, or the entire social significance of the yardstick is lost: the rate charged for electricity, within wide limits, determines the cost. No yardstick rate for domestic electricity, at least in my opinion, is worth serious consideration unless it is based on this principle.

But how to get wide use and in turn low costs? The answer of the TVA yardstick is: Low rates; genuinely low rates. Low rates will bring increased use, and increased use results in low costs. There are limits, but they are far off.

Some critics of this yardstick principle say: We want to charge low rates, but we can't lower rates further until we can cut our costs, and we can't cut costs unless people buy more electricity. Your yardstick rates would probably work if people used twice as much electricity as they do, but until they do, such rates are impossible.

And with a few exceptions that is the answer, too of the rate regulatory commission. With an eye fixed by the law on present costs based on present consumption of electricity, the Commission says:

"We can't order genuinely low rates because the lower rates would be below the cost of distribution. When people use more electricity, such rates would be feasible." In other words, in the regulation of rates under the fair value [fol. 3737] theory, plainly the cart is before the horse. • • •

COMPLAINANTS' EXHIBIT No. 848 (Excluded)

I do not want to minimize the difficulties or over-simplify the problem. The orgy of utility financial malpractice has left the operating managements with a legacy of crushing capital structures. To ask a utility management carrying such a load to take a step involving even a few months' reduction of revenue is expecting a good deal. Nor is this all. The sedative of tradition and the deep, dark mystery with which rate experts have surrounded their cult are not conducive to an original re-examination of electric rates.

The difficulties are great, I grant, but the — stake is great—nothing less than the electrification of America. • • •

TVA Press Release of April 13, 1936

Adamsville, Tenn., April 13.—Fifty-six miles of rural electric distribution lines operated in McNairy and Hardin counties, Tennessee, by the Alcorn County Electric Power Association of Mississippi, will be transferred on Tuesday, April 21, to the newly formed Pickwick electric membership corporation, it was learned here today. Assurance was given that there will be no interruption to service.

[fol. 3740] COMPLAINANTS' EXHIBIT No. 851 (Excluded)

TVA Press Release—Undated

Jackson, Tenn.—The Pickwick Electric Membership Corporation, recently established to distribute TVA power in rural areas, will put 70 miles of rural electrification lines in operation in Chester, Hardin and McNairy Counties, in west Tennessee, on April 21st, it was announced by E. R. Wall, TVA division engineer for West Tennessee. These lines will serve approximately 450 customers.

The lines were built for the corporation by the Tennessee Valley Authority and will bring electricity into areas which have never before had electric service.

In addition to these lines, the Pickwick Electric Membership Corporation has taken over 56 miles of rural distribution lines in McNairy and Hardin Counties from the Alcorn County Electric Power Association of Mississippi. These lines form part of the corporation's present rural network.

[fol. 3741] COMPLAINANTS' EXHIBIT No. 852 (Excluded)

TVA Press Release of July 23, 1936

The Aluminum Company of America today became the first contractor of industrial power generated at Norris Dam with the signing of a contract between the company and the Tennessee Valley Authority, it was announced at TVA offices here.

The contract was executed as TVA began first preliminary tests on the huge Norris generating units.

In addition to the purchase of industrial power, the contract provides that the Company will supply power to TVA for full construction requirements at Fowler Bend Dam, to be built by TVA on the Hiwassee River. The Authority will reimburse the Company for construction power by supplying an equal amount of power transmitted from Norris Dam to Alcoa, where the Aluminum Company plant is located.

Two transmission lines will be required. A 154,000-volt line will be constructed between Norris Dam and the company's plant at Alcoa, near Maryville, Tenn. A second line will carry power from Santeetlah Dam owned by the Aluminum Company to Fowler Bend damsite. Both lines

COMPLAINANTS' EXHIBIT No. 852 (Excluded)

[fol. 3742] are to be constructed by TVA, and each will be about 35 miles in length.

The contract calls for the purchase by the Aluminum Company of Norris Dam power in blocks not to exceed 20,000 kilowatts demand. Terms of the agreement dispose of a class of power which municipalities and other public agencies could not use, it was explained, since it will be available only after all other requirements have been met.

The contract describes this class of power as the Authority's "Surplus over navigation and flood control requirements and other loads and commitments."

The rate for power purchased by the Company is the regular TVA rate for transmitted secondary power.

June 1, 1937, is given as the date for initial power delivery to the Company. The contract will be in force for a period of four to six years, depending upon the construction time for Fowler Bend Dam. January 1, 1937, is given as the date for initial delivery of power to the Authority at Fowler Bend.

TVA Press Release of August 7, 1936

David E. Lilienthal, director of the Tennessee Valley Authority, has been called to Washington to attend a meeting on August 12, of the Executive Committee of the American National Committee of the Third World Power Conference, of which he is a member. The World Power Conferences, which will bring to the United States engineers of importance from many countries, will meet in Washington September 7-12.

Concurrently will be held the Second Congress of the International Commission on Large Dams of the World Power Conference.

The purpose of the Conference, generally, is to consider how the sources of heat and power may be adjusted nationally and internationally. Harold L. Ickes, Secretary of the Interior, is chairman of the American National Committee.

While in the United States, the distinguished engineers will take advantage of an opportunity to study American dams and utility systems. Four separate groups are sched-

COMPLAINANTS' EXHIBIT No. 853 (Excluded)

uled to visit the Tennessee Valley to study work of the Tennessee Valley Authority. The first group will make its [fol. 3744] visit on September 2, 3, 4; the second on September 14, 15, 16; the third on September 21, 22, 23; the final one early in October, probably on October 3, 4, 5.

Three tours have been planned for the visitors in the Valley. One will take them to Norris Dam and the town of Norris; another will show them the construction activities at the Chickamauga Dam, near Chattanooga; the final one will be to the Muscle Shoals area, for a study of Wilson Dam and the TVA Fertilizer works.

TVA Press Release of August 19, 1936

The Tennessee Valley Authority today announced the execution of an electric power contract with the Volunteer Portland Cement Company of Knoxville, Tennessee. Date of initial delivery of power is fixed at April 15, 1937.

The contract provides for purchase by the company of a maximum of 3000 KW. "firm or continuous power," for a period of ten (10) years. The Authority will deliver power at the Company's plant, situated in Knox County, near Knoxville, over a transmission line to be constructed by the Authority from Norris Dam.

TVA Press Release of August 28, 1936

Cullman, Ala.—In cooperation with local electric appliance dealers, the Cullman County Electric Membership Corporation will sponsor a three day Electric Fair in this city beginning September 17th.

The fair will feature dealers' displays of equipment showing the many uses of electricity on the farm, both in the home and for general farm use, such as pumping water, grinding feed, heating hot beds, etc.

Cooking schools will be held during the fair, at which prizes, donated by the dealers, will be awarded. Prelim-

COMPLAINANTS' EXHIBIT No. 855 (Excluded)

inary to the fair, the corporation will hold a series of cooking schools in each of the fifteen rural communities in Cullman County, in which its network extends.

The Corporation's system of approximately 133 miles of rural electrification lines, built in conjunction with the Rural Electrification Administration and the Tennessee Valley Authority, is rapidly nearing completion, and a part of the network is already in operation. Approximately 690 [fol. 3747] farmers and consumers living in small villages have contracted with the corporation for power service. The farm communities which the corporation will serve include Fairview, Welti, Berlin, West Point, Guthrie Store, Longview, Headrick, Ebenezer, Simco, Baileyton, Crane Hill, Logan, Cataco, Jones Chapel, and Trimble. The corporation buys its power from the Tennessee Valley Authority and distributes it to consumers at TVA resale rates.

TVA Press Release of September 19, 1936

The Tennessee Valley Authority has authorized a rural electrification project in four Mississippi counties—Clay, Oktibbeha, Noxubee and Lowndes—it was announced today. Points to be served will include the Mississippi State College at Starkville.

Approximately 200 miles of rural lines will be needed to serve 800 farms in the four counties. At the present time these farms do not have electric service.

The project will be submitted to the Rural Electrification Administration at Washington for approval of a loan to finance construction. Power is to be supplied from a 44,000 volt line connecting with the TVA srbstation at Okolona, Miss.

Sent for release to Saturday morning Papers, September 19, 1936.

TVA Press Release of October 1, 1936

Power from the second generator at Norris Dam was turned into the Tennessee Valley Authority's 220-mile Norris-Wilson Dam transmission line Wednesday at about 2 p. m., C. L. Karr, head of the Division of Power Operations, announced today.

The two generators, first of which went into operation about August 6, were adding 46,000 kilowatts to the 110,000 generated by the six out of eight generators in operation at Wilson Dam, making a total of 156,000 kilowatts.

All available water was being used, the operations department reported, none being spilled through the sluiceways at either dam. The water level at Norris Dam was approximately at the point dictated for the date by the rule curve for operation of the dam.

October 1, 1936.

[fol. 3750] COMPLAINANTS' EXHIBIT No. 858 (Excluded)

TVA Press Release of October 12, 1936

The Tennessee Valley Authority announced today that the City of Athens, Alabama, the first city in Alabama to contract for TVA power, has also become the first to sponsor a county-wide rural network to bring TVA power to the surrounding farm areas.

Arrangements have just been completed, the announcement states, whereby Athens will acquire from TVA all of the Authority's rural lines in Limestone County, and, in addition, construct some 65 miles of new lines with funds borrowed from the Rural Electrification Administration. The result will be a combined rural system radiating out of Athens and serving a total of 649 farm customers on 135 miles of line.

Transfer of the TVA lines to Athens will be made on October 31, and arrangements for construction of the new REA lines will be undertaken immediately. The rural customers will receive power at the standard TVA resale rates, plus an amortization fee of 1 cent per kilowatt hour up to the first 100 kilowatt hours per month, which will be used to retire the cost of the lines.

COMPLAINANTS' EXHIBIT No. 858 (Excluded)

The City of Athens first began to receive TVA power for its municipal electric system on June 1, 1934, and since that time its electrical development under TVA rates has [fol. 3751] attracted nation-wide interest. Between June, 1934, and September, 1936, consumption of electricity doubled, and average home use increased threefold, from 51 kwh. to 151 kwh. On September 1, 1936, 78% of the city's customers had electric refrigerators, 35 per cent electric ranges, and 14 per cent electric water heaters.

During the period of TVA power service, the number of customers increased from 692 to 1,032. Addition of the rural system will bring the total to nearly 1,700.

The plan for extension of rural lines by municipal electric systems has been put into practice by a number of cities distributing TVA power. Within the past year, extensive rural systems were constructed by the cities of Dayton and Pulaski, Tennessee, and New Albany, Mississippi. An REA grant for 70-mile rural network has recently been received by the city of Holly Springs, Mississippi, and the cities of Bolivar, Milan, and Somerville, Tennessee, are all proceeding with surveys for rural lines radiating out of their municipal systems.

In a message to Mayor R. H. Richardson, Jr., of Athens, [fol. 3752] David E. Lilienthal, Director of the TVA congratulated the city on its action and stated:

"The program adopted by your city administration is one which should be of genuine value both to the city and the surrounding area. Our experience has shown that the greatest benefits of electric service may be obtained when town and country unite in a plan of economical distribution. The city of Athens has already demonstrated its leadership in electrical development within the city limits and we are glad now to see the city take the lead in a far-reaching program of rural electrification."

TVA Press Release of October 17, 1936

Talk Before the Public Ownership League of America, Springfield, Illinois, October 16, 1936, by William I. Nichols, Director Division of Electrical Development

* * * * * * *

COMPLAINANTS' EXHIBIT No. 859 (Excluded)

I can testify to you here tonight that this is the spirit in which the TVA is being administered—that this is the point of view of the hundreds of engineers and chemists and foresters and all the rest who are now gathered together in the Tennessee Valley from every state in the Union. They regard their program as a testing ground for the nation and their work is dedicated to the service of all the people. If by experiment in the Tennessee Valley it is possible to develop a set of simplified promotional electric rates, then it is to be expected that these rates will be applied elsewhere—and this has, in fact, been done with savings of tens of millions of dollars to consumers in all parts of the country. If by experiment in the Valley it is possible to develop improved and simplified standards for rural line construction, it is possible for them then to be adopted in other areas—and this also has been done, speeding forward the [fol. 3754] national movement for rural electrification. If by experiment in the Valley, it is possible to develop an improved phosphate concentrate, and better crop management, to save and enrich the soil, then these things also can be adopted elsewhere. Even where the TVA has made mistakes—and like every agency, public or private it has made mistakes—even then the country profits, in a sense, for this experience may eliminate similar and perhaps more costly mistakes elsewhere.

• • • • • • • •

Clearly the execution of such a program for an entire region—affecting portions of seven states, 40,000 square miles, and over two and one-half million inhabitants—is an enormous job and a complex job. Today, after little more than three years the Authority is employing over fifteen thousand men and women. In addition to Wilson Dam, it has completed two other great dams, Wheeler Dam and Norris Dam, and is operating an extensive transmission system. Four additional dams are under construction. One of the nitrate plants is now engaged in the experimental produc- [fol. 3755] tion of fertilizer for testing on demonstration farms, but not for sale. The work of reforestation, soil erosion control and rural electrification is moving forward over a wide front.

• • • • • • •

COMPLAINANTS' EXHIBIT No. 859 (Excluded)

Out of these two has come also the third idea, which is this—that in the development of water control, water power, belonging to the people should be enlisted and marshalled in the service of the people.

[fol. 3756] COMPLAINANTS' EXHIBIT No. 860 (Excluded)

TVA Press Release of November 16, 1936

The TVA And Cities, by Arthur E. Morgan, Before Annual Meeting of United States Conference of Mayors, Mayflower Hotel, Washington, D. C., November 16, 1936

There is a steadily growing movement toward public ownership of electric power distribution. In the past 30 years the private power industry has organized large areas into integrated systems. As compared with having each small town or city operate a separate power distribution service, this organization of large distribution systems has great economies. Even if a dependable source of power is insured, it is not economical for each municipality to maintain its own research and mechanical staff, its own experts and its own adequate managing personnel. In the transition from private to public ownership of power distribution it is very important that the operating economies of the private industries shall not be lost. It is important that areas taken over from private to public ownership shall be of such size and of such characteristics that economy of organization and operation can be preserved. This will [fol. 3757] mean that single cities and towns, especially those of moderate size, cannot economically act alone. Efficient distribution areas should be organized, which commonly may include several cities and towns, and considerable rural area. For electrical distribution a city is not as a rule a normal unit.

* * * * * * *

Electric power distribution by public ownership must be seen as a regional rather than as a municipal matter.

* * * * * * *

COMPLAINANTS' EXHIBIT No. 860 (Excluded)

A system of large dams will create a very large supply of power. Such a power system is a complicated technical development, yet for the farmer who is relieved from pumping water for his stock, for the housewife who can wash and cook and sweep and preserve her food electrically, it means a great lessening of burdens and a simplification of living. As part of a multi-purpose development, power can be secured more cheaply than if the construction should serve power alone.

The unified control of the Tennessee River is the greatest project of its kind the modern world has known. It requires the storing of vast volumes of water during flood sea- [fol. 3758] sons, and the planned use of that storage during low water periods. It demands complex adjustments between up-river and down-river power plants, between navigation, flood control and power.

[fol. 3759] COMPLAINANTS' EXHIBIT No. 861 (Excluded)

TVA Press Release of March 23, 1937

An Economic Plan Versus Economic Planning in the TVA

Address by Dr. Arthur E. Morgan at the Annual Conference of Schoolmen's Week at the University of Minnesota, Tuesday, March 23 at 9:45 A. M.

Then, also, the Tennessee River has large possibilities for hydroelectric power. It is not only desirable but necessary to combine power development with flood control and navigation. The damsites which are most suitable for power development also are necessary and the only good ones available for navigation and flood control. It is cheaper to secure those three objects together than to work them out separately.

Even considered as a power project alone the unified control of the Tennessee River transcends private initiative. If different private companies should build independent projects on different parts of the river system there would be a lack of that integration which makes for the most economical power development.

COMPLAINANTS' EXHIBIT No. 861 (Excluded)

The Wilson Dam at Muscle Shoals on the Tennessee River [fol. 3760] is a "run of the river" plant. That is, there is very little storage above the dam, only enough to regulate the river for a day at a time. The flow of the Tennessee River varies greatly between high and low water. In high water periods there is enough water supply to generate more than half a million kilowatts of electric energy. During very dry seasons less than a tenth as much power can be developed. Now, as most of you know, it is only continuous power, or prime power as it is called, which has a high market value. Power which is available for only six or eight months in the year is worth but a fraction as much. Because the continuous power it will supply is so small, the Wilson Dam taken by itself is not highly profitable as a power development.

Hundreds of miles upstream on the Clinch River, a branch of the Tennessee, the TVA has built the Norris Dam and power plant, which is of a very different character. This dam forms one of the world's largest reservoirs, which will store almost a year's flow of the river above. During the winter and spring, when there is enough or too much water in the river below, the Norris Dam is closed and the water [fol. 3761] stored. Then during the dry season it is used to make power when power is most valuable, and when the Wilson Dam has the lowest supply. But that is not all. The water which passes through the Norris Dam power plants flows down river to Wilson Dam and about doubles the low water supply there. There are eight present and prospective dams in the TVA program on the Tennessee River below the Norris Dam, and the water released from the Norris Dam in very low water will about double the power at each of the dams below. The Norris Dam taken by itself would not be a highly profitable power development, but when we consider how it can be regulated to about double the prime power supply at eight other dams downstream, we can see the value of a single integrated power system for the entire river.

There are other benefits of an integrated system. For instance, the Chickamauga Dam, now being built by the TVA on the Tennessee River, is primarily for navigation, but will develop power as well. It differs from Wilson Dam below in that it has a relatively low head, about 50

COMPLAINANTS' EXHIBIT No. 861 (Excluded)

feet at ordinary river stages. In flood season it is almost drowned out and will produce no power, while in very [fol. 3762] dry seasons it also could by itself produce little power. Wilson Dam below is a high dam. Not only is its power not reduced during floods, but those floods supply water for a very large increase in the amount of power which can be generated. Therefore, in high water seasons when the Chickamauga Dam is drowned out and can supply no power, the Wilson Dam has an abundant supply, while in very low water when Chickamauga Dam would have little power, the Norris Dam will turn down water and double its power output. Thus these three dams which taken separately would not be highly profitable investments for power, when they are operated together as a single system, will develop more than twice as much prime power as the sum of the three operated separately. That is only the simple beginning of a great system of interrelated dams on the Tennessee River and its tributaries. Taken all together and owned and operated as a single system, a great variety of economies can be secured, and the combined value is far greater than though the different units should be owned and operated separately.

[fol. 3763] COMPLAINANTS' EXHIBIT No. 862 (Excluded)

TVA Press Release of November 28, 1935

Tennessee Valley Authority, Knoxville, Tennessee

The Tennessee Valley Authority today made public a statement of David E. Lilienthal, Director in charge of electricity operations, addressed to E. O. McLean, Chairman of the Bedford County (Tennessee) Rural Electrification Committee, in answer to the following telegram from Mr. McLean:

"THE FARMERS OF BEDFORD COUNTY HAVE PUT FORTH MUCH EFFORT TO ORGANIZE AND BUILD A COOPERATIVE RURAL DISTRIBUTION SYSTEM AND PURCHASE POWER FROM THE TVA STOP MANY OF US ARE FEARFUL THAT THE BUILDING OF SPITE LINES BY THE TENNESSEE ELECTRIC POWER COMPANY MAY CAUSE THE

COMPLAINANTS' EXHIBIT No. 862 (Excluded)

TVA TO ABANDON OR WITHDRAW THEIR COOPERATION WITH THE BEDFORD COUNTY PROJECT STOP PLEASE ADVISE US THE AUTHORITYS ATTITUDE IN THIS MATTER."

E. O. McLean, Chairman Rural Electrification Committee.

[fol. 3764] Mr. Lilienthal's answer follows:

I have your telegram requesting a statement of the Authority's position and policy in its rural elect-fication program. Let me emphatically assure you, on behalf of the Tennessee Valley Authority, that any commitments we have made as to cooperation in the farm electrification program you and your neighbors have set up will be carried out in every detail. The directors of the Authority and our staff in the field who have been working with farmer organizations have recognized that within the past few weeks there has arisen a situation which threatens to destroy the farmers' plans and projects, to which you and your neighbors of Tennessee and Alabama have given so much in time and energy.

You recognize, as we have recognized, that the construction of what you term "spite lines" may destroy your own organizations for county-wide programs of farm electrification. Let me say to you and to every other farmers' organization similarly situated that the Tennessee Valley Authority, as an agency of the United States Government, will stand by you and your neighbors to the limit, to protect your farmers' organizations from destruction by unfair tactics.

Congress, in creating the Tennessee Valley Authority, [fol. 3765] clearly defined the manner in which the Authority was to make use of the surplus electric power produced as a by-product at its navigation and flood control dams in the Tennessee River basin. To carry out this mandate of Congress and of the Administration, the Authority is required to give preference to state, counties, municipalities and to cooperative associations and non-profit organizations formed by people in rural areas.

The very nature of the Authority's entire program makes it of first importance that this surplus electricity be made available to all. In carrying out this policy in actual prac-

tice, special consideration has been given to the needs of rural areas. This policy and practice have been accepted with overwhelming approval by both town and country everywhere electricity has been made available. And as a result of this emphasis in the Authority's program, the whole question of rural electrification in the Valley has received remarkable stimulus. In those sections where TVA service is an immediate possibility, or where availability of power is likely in the near future, farm and town groups have organized themselves into associations and cooperatives to carry out their part of the electrification program. [fol. 3766] These groups have undertaken to survey their own lines, to perfect their own organizations, and to initiate negotiations with the Authority for electricity.

This movement has been participated in by the state legislatures, by the creation of state Rural Electrification Administrations, by the cooperation of Farm Bureaus, county courts, county agents and other agricultural agencies of the Valley.

TVA, as a public agency, has been requested to cooperate with these self-organized farm groups in rural electrification plans. In this work the Authority has maintained its policy of avoiding any duplication of service or any paralleling of existing lines. On this working basis the Authority has entered many rural areas and is now serving with electricity cooperative or town and country organizations in both Tennessee and Mississippi. In no instance heretofore has the Authority or a cooperative association constructed lines except to serve customers not previously served by any power company.

The urgency and necessity for determined steps toward rural electrification is apparent. Only a beginning has been made. We have just scratched the surface on this job. What you and your neighbors throughout the Valley are doing has grown out of the determination of the people [fol. 3767] of the Valley to obtain for this area the benefits of cheap electricity. It is a movement which has come from the people themselves, working through their own organizations.

Before the farmers' organizations and TVA started action to get power to farmers who have been denied it all these years, the private power companies had taken little

or no interest in these unserved rural areas. This orderly and successful drive for farm electrification is now threatened by certain hastily undertaken activities of a small number of private power companies. Perhaps this can be best illustrated by relating what has happened and what is happening in Dayton and in Rhea County in Tennessee.

The City of Dayton signed a power contract with the Authority September 12, 1934, and service was supplied beginning February 1, 1935. As a result of this contract there was an immediate interest in the possibility of line extensions from Dayton to adjacent rural areas in Rhea County. During the latter part of March a mass meeting of the farmers was held in Dayton at which time the City and the Authority were requested by the farmers to undertake rural service in Rhea County. On Monday, April 1, 1935, the Rhea County Squires met and prepared a resolution which [fol. 3768] formally expressed the desire of the rural residents relative to obtaining rural electrification and cooperating with the Authority to this end. Preliminary surveys were begun with a view of working up a rural electrification project for the county and these were presented to the Rural Electrification Administration with a formal letter of application on May 31, 1935. Due to the enthusiasm in the County it was found necessary to enlarge the scope of the electrification and a new survey was made. This was presented to the REA on October 2, 1935, with a request for additional funds. On October 17, 1935, news releases stated that the REA had tentatively approved the loan to the City of Dayton. On October 30, 1935, approximately thirteen days after the announcement of the loan and six days before the final approval that REA money was available, certain Tennessee Electric Power Company crews entered Rhea County and began construction along routes which had been previously surveyed for the rural electrification project of Dayton.

The Authority is now constructing for Dayton the lines originally laid out in the rural electrification project for Rhea County. If the Power Company pursues its present practice, there therefore will result a certain amount of [fol. 3769] line duplication in this County. The Authority is not going to break faith with the farmers with whom commitments for this service had been made. The Author-

ity's policy against duplication of facilities cannot be used to defeat the plans of the farmers' themselves who were unserved when their plans were made.

One of the fundamental principles of the Authority's policy in rural electrification is that lines be built and operated on a sound business basis. Sound public policy requires that lines shall include those closely-built sections which are profitable, as well as those more scattered sections where revenues are lower and costs per farmer somewhat higher. If the profitable sections of the area are taken away from the farmers' association by the private power companies the farmers in the rest of the area are left out in the cold and the whole object of widespread electrification defeated. If the power company had been able to take short pieces of these Rhea County lines, many miles would have been left without service and with no possibility of service in the future. Perhaps this is why you have called these power company over-night lines "spite lines."

What has been happening in Rhea County is not an iso- [fol. 3770] lated instance. It is cited in detail merely to point out the issues involved. Similar occurrences have taken place and are taking place in many parts of the Valley.

In general, there are three circumstances which should be given particular attention at this time.

First, is the long period of neglect of rural electrification by private power companies. It is only recently that companies in this region have taken any genuine interest in the field of general or widespread farm electrification. Their efforts have been restricted almost entirely to the construction of certain profitable lines near large load centers or concentrated areas of population. Even in this restricted program of rural line construction, the customers themselves were forced to pay a heavy price as their share in this construction.

Second, is the strange coincidence that the power companies are interested almost exclusively in these rural areas where TVA power is immediately or imminently available. A general rural electrification program of private power companies is, of course, to be applauded. But the present activities are not general and the program could hardly be

called one of widespread rural electrification. It seems a [fol. 3771] remarkable accident that the greatest activity of the private power companies has been in sections where some steps toward obtaining TVA power had been taken, and that this action in many instances has resulted in the construction of power company lines along exactly the same routes as laid out by cooperative farmer organizations to be supplied with power from the Tennessee River dams.

Third, is the fact that the power companies appear to be undertaking, not a general rural electrification program, but what will, in many places, amount virtually to a blocking of general rural electrification. This has been pointed out in the Rhea County instance. It is true elsewhere. The construction of a few miles of rural line, and the serving of a few farms at strategic points, can wreck the chances for ever having a soundly operated system of rural lines serving both sparsely and thickly populated sections throughout a county or area.

In viewing the whole question of rural electrification, it should be borne in mind that this problem reaches across the entire Tennessee Valley—across, indeed, the entire South. There is more rural electrification to be done in this territory than any one agency, any one company or a [fol. 3772] group of companies can do this year, or in the next three or four years. The field for rural electrification is almost unlimited. To get the job properly done will tax the abilities and capacities of every party concerned.

It is inescapable in the very nature of the situation that there will be farm electrification by cooperative groups, by municipally owned electric systems, by county associations and by private power companies.

Electricity is coming to the farms of the Tennessee Valley. Its coming is as inevitable as the coming of the day when the menace of destructive floods in the Valley will be a fear of the past. But this electrification of Valley farms, the bringing of electricity to rural communities, can be obstructed, can be made costly in labor and in money, can be delayed beyond all need for delay unless the farmers, the towns, the private companies and the public agencies find some just and reasonable basis for harmonious cooperation.

COMPLAINANTS' EXHIBIT No. 862 (Excluded)

In conclusion, in reply to your direct inquiry let me say this to the farmers of Bedford County and other counties where farmers have organized their own cooperative electric system: TVA has no intention of abandoning or with-[fol. 3773] drawing their cooperation with these projects. Furthermore, the Tennessee Valley Authority will stand shoulder to shoulder with the farmers' organizations in their efforts to secure electricity for the largest possible number of farmers.

Thank you for wiring me, and be assured that we are all deeply interested in the work you are doing.

David E. Lilienthal.

[fol. 3774] COMPLAINANTS' EXHIBIT No. 863 (Excluded)

TVA Press Release of May 30, 1934

Address of Dr. Arthur E. Morgan, Delivered Before the Central States Forestry Congress May 30, 1934

President Roosevelt was determined that the hydroelectric project at Muscle Shoals reach fruition; that it should be supported by additional developments. He was interested that the fertilizer project should go ahead, but all that might have been carried through as the sole purpose and intent of the legislation. The President, however, did not rest there. In his message to Congress forecasting the bill for the Tennessee Valley Authority, he said that the great development at Muscle Shoals was only a minor part, that he looked forward to a project for bringing industrial and social order out of the haphazard growth that had characterized our national life and that he hoped this region might be a case in which methods and policies might develop, with the prospect that if they should develop soundly and successfully here, these same policies might have wider application in other parts of the country.

* * * * * * *

[fol. 3775] The Tennessee Valley Authority Act defines two or three very specific purposes and gives quite definite instructions for their fulfillment. One of these is the dis-

COMPLAINANTS' EXHIBIT No. 863 (Excluded)

tribution and sale of electric power. It is the opinion of President Roosevelt, I believe, that it probably would not be wise for the public to generate all the power in the United States. Within the last two years he has expressed himself to that effect. He believes, however, that the public utility business, so far as power is concerned, has not always been wisely handled; that there has been mismanagement; that there has been over-capitalization; that there has been undue political influence. There have been a good many methods that ought to be eliminated from large-scale industries in the United States. He has suggested that there be set up what he called a "yardstick" for power, an example of public ownership in generation, transmission, and distribution, where all the factors could be in evidence, where there could be complete and unquestionable fair analysis and records so that the public might discover, perchance, what is actually the necessary cost of power, and whether the public in reality can handle projects as effec- [fol. 3776] tively as private industry.

The Tennessee Valley Authority has made contracts for supplying a number of communities with electric current. Only one such contract is in actual operation as yet. One or two more will be in operation within a month, and about a dozen more contracts have been made which will go into operation as soon as legal processes can be completed. It was the attitude of the President, and it is the attitude of the Board of Directors of the Tennessee Valley Authority, that existing investments in electric power utilities should not be unnecessarily disturbed; that existing values should be recognized. And so it has been the policy of the Tennessee Valley Authority in acquiring an area in which to use this "yardstick", so far as possible, to come to amicable settlement with those who at present occupy the area.

We have, up to date, purchased considerable area and considerable plant and equipment from one of the large power organizations of the country. We are now distributing that power. The one municipality which so far has been using Tennessee Valley Authority power is the City of Tupelo, Mississippi. We have established rates there that are somewhat less than half of the rates formerly paid.

. . . . . .

COMPLAINANTS' EXHIBIT No. 863 (Excluded)

[fol. 3777] I am going to make one other observation with reference to power. The same law which proposed the generation and sale of power at Muscle Shoals by the Government, authorized the construction of the Cove Creek or Norris Dam on the Clinch River. Some of you visited that yesterday. The Wilson Dam power plant at Muscle Shoals taken by itself alone is not a profitable investment. It is not profitable alone for the reason that there is very little storage in the river above, and while in high water there is a very great supply of power, when the river is low that power drops off. Last summer it dropped down to less than 35,000 kw. capacity for the entire plant. In our wet winters it goes up to more than 500,000, a range of 1 to 24. Now you all know the value of power is the value of what we call "Prime Power", or that which is dependable. The power that is available for only part of the year has relatively little value, and for that reason the Muscle Shoals plant, taken by itself, is not a profitable investment.

On the Clinch River at Norris Dam we have another power project of a very different sort. There we have one of the greatest storage reservoirs in the world coming into being [fol. 3778] with a storage capacity of 3,000,000 acre feet. We can store the average year's flow of the river above that power plant, a drainage area of 2,000 or 3,000 square miles. But the Norris Dam power plant taken by itself would not be profitable. It cost about $250 per installed horsepower, and that is too much to pay for power. Neither one of these plants taken alone is a good investment, but taking the two together you have a very different situation. At Muscle Shoals the power available drops down very low for, say, three months in the year. After eight or nine months of reletively high water, we may have a dry spell in August, September, October,—when the river so nearly runs dry. With Norris Dam constructed it will be possible to store up water in Norris Reservoir throughout most of the year, then when the river below is very low, to generate power at Norris Dam at the time power is most needed. When that water has passed by Norris Dam, it will flow down to Wilson Dam at Muscle Shoals and go through that power plant also. We may use the entire year's flow of the river, possibly, in two or three months by letting it out just when needed. In that

COMPLAINANTS' EXHIBIT No. 863 (Excluded)

way we can raise the prime or dependable power at Muscle [fol. 3779] Shoals from say 25,000 or 35,000 kw. to 150,000 or 200,000 kw. This represents the value Norris Dam can add to Muscle Shoals. Not only to Muscle Shoals, but the same is true with every plant down the river below Norris Dam. There is room down the river for about eight power plants.

That same necessity for coordinating development extends throughout the Tennessee River system. Ultimately, it will be possible to develop four million hp. from the Tennessee River system. Possibly half of that will be along the main river; possibly the other half will be on the headwaters; but the reason such a large amount can be developed is that we can develop the headwaters and lower plants as one unit. By doing that, we can possibly cut in two the cost of producing hydroelectric power. And so we hold that the development of the water power of the Tennessee River ought to be a single integrated project and not a series of unrelated projects.

The Norris Dam is being built for power development, but that is not an end in itself. We do not develop power just so that there can be power development. We develop power to contribute to the well-being of the people in this [fol. 3780] region. It is only a mean- to an end. The object of building a dam is to provide power; the object of providing power is to raise economic and social conditions of a region.

* * * * * * *

It would please me very much to see industry growing up here, owned at home. We see public utilities with ownership a thousand miles away. We see the employees here getting their monthly salaries; we see the users of these utilities getting their monthly bills; and all the cream of profits goes hundreds of miles away. It seems to me that the absentee ownership investment ought to be getting a decent rate of interest and fair compensation so far as management is concerned, but otherwise the fruits of production ought to be staying in their own region, and there ought not to be a bleeding of one region to keep another, as has been the situation here.

TVA Press Release of June 1, ——

The Tennessee Valley Authority Friday paid to the Mississippi Power Company the sum of $850,743 for the acquisition of the company's properties in nine counties in Mississippi. The counties are: Pontotoc, Lee, Itawamba, Union, Bonton, Tippah, Prentiss, Tishomingo and Alcorn.

The properties acquired by the Authority are those which have been under option since January. In the intervening weeks examination of titles and other legal work necessary has been carried on under the direction of J. C. Swidler, TVA power attorney, assisted by W. G. Roberds, attorney of West Point.

Assuming the ownership of the facilities in the nine counties conforms with the policy of the directors of the Authority, as announced by David E. Lilienthal, director in charge of power.

"The Authority is under duty to acquire a market for its power," he said. "It is authorized to compete with existing utilities, and for this purpose is expressly empowered to erect duplicate facilities. But no competing facilities have been constructed, and I am authorized to say that under the present Board none will be constructed, until every reasonable alternative has been exhausted."

Mr. Lilienthal said that the Authority will use the acquired facilities at the earliest possible moment.

[fol. 3782] COMPLAINANTS' EXHIBIT No. 865 (Excluded)

TVA Press Release of June 3, 1934

Residents of Corinth and Alcorn County, Mississippi, will receive an electric rate reduction averaging approximately 40 per cent and be enabled to acquire a debt-free electric distribution system in from eight to ten years under terms of a contract announced today between the Tennessee Valley Authority and the Alcorn County Electric Power Association.

Effective immediately, the contract places the Alcorn County Electric Power Association in business with a system purchased for $114,632.60, serving the entire county,

including the city of Corinth. There is a provision for construction of new rural electrification lines by the Tennessee Valley Authority up to 100 miles of lines. These may be taken over by the Association in the same manner as the present property is being acquired, at a total cost not to exceed $125,000. The power association is a non-profit corporation, incorporated under Mississippi laws.

Rates charged for city residential and rural service will be the same. They will equal rates now in effect at Tupelo, Miss. Installment payment made by members will pay for purchase of the system.

[fol. 3783] The property transferred to the association is a part of the city and rural lines acquired by the Tennessee Valley Authority from the Mississippi Power Co., privately owned utility which previously served this territory.

"This contract is a remarkable demonstration of cooperation between townspeople and farmers in Alcorn County," David E. Lilienthal, Tennessee Valley Authority director in charge of power, said today in announcing the contract. "It is concrete evidence of the mutual interests of town and county."

The association will receive power from the Tennessee Valley Authority, delivery being made at the Corinth substation.

As explained by Mr. Lilienthal, the Alcorn County plan will function as follows:

Purchase of the electric distribution system in Corinth and the county will be made by the Alcorn County Electric Power Association. All residents of the county are eligible to membership.

The association will pay city, county, state and federal taxes the same as any other private corporation. Purchase will be made without issuance of bonds.

[fol. 3784] Members of the association will pay installments according to benefits received from the Association—approximately according to the amount of electricity used by the member each month. These payments will be used for the sole purpose of clearing the system of all debt.

The association will sell memberships at $100, payable either $80 in cash, or $10 down, plus one cent per kilowatt hour for each kilowatt hour up to 100 kwh. a month, with a minimum monthly membership charge of 25 cents.

COMPLAINANTS' EXHIBIT No. 865 (Excluded)

Under this schedule, the user of 25 kilowatt hours in a month would pay a minimum bill of 75 cents, as at Tupelo, plus 25 cents membership installment. A user of 50 kwh. would pay $1.50 for current and a 50 cent installment.

For 100 kwh., the member would pay $2.50 for current and a $1 installment. Users of 200 kwh. would pay $4.50 for electricity and a $1.00 installment.

These membership payments are turned over by the association to the Tennessee Valley Authority in payment for the system.

"The residents of Corinth and Alcorn County recognize [fol. 3785] the importance of owning their own plant," Mr. Lilienthal said. "They further recognize the advantages of making the system pay itself out of debt so that debt charges will not be paid indefinitely.

"While the Tennessee Valley Authority is wiping out the debt charges on its Muscle Shoals properties, these people will be doing the same thing with their distribution system.

"The plan might be described in this manner:

"Everybody in Alcorn County pays the Tupelo rate—that's the rent on the house. But the people want to own the house, so all of them are going to chip in and wipe out the mortgage. In spite of low rates, the system will soon be paid for, and then the only expense will be bare cost of wholesale power, operation and repair.

"Each member will pay installments approximately according to the benefits in electricity he received. Under the present rates a surplus will be created. At the end of the purchase period, the installments will no longer be necessary and the surplus can be used in reducing rates further and members can begin paying themselves back the member-[fol. 3786] ship capital they have invested."

The contract pledges that the Authority "will, by every means within its power, seek to further the economic welfare" of Alcorn County "by fostering and promoting the increased use of electricity.

Management of the association will be in the hands of members, with supervision by the Authority.

Present electric customers who do not choose to join the association may continue to be served at the old Mississippi Power Co., rates.

COMPLAINANTS' EXHIBIT No. 865 (Excluded)

Revenues of the association must be distributed as follows:

First, to pay all operating costs, including taxes and maintenance.

Second, to establish a reasonable reserve for new construction and other contingencies.

Third, to clear the system of all debt, thus eliminating cost of debt.

Fourth, after indebtedness is wiped out, membership installments are to be reduced or eliminated.

Fifth, after these fees are eliminated, surplus earnings are to be devoted to further rate reductions and to repay members their original membership investment.

[fol. 3787] The following table shows a comparison between present rates and rates under the Alcorn Power Association plan using TVA power:

No. of kwh. Consumed	Cost at Alcorn Membership Rates	Cost at Present Corinth Rates	Savings
25	$1.00	1.85	$.85
30	1.20	2.40	1.20
40	1.60	2.68	1.08
50	2.00	3.50	1.50
60	2.30	3.80	1.50
70	2.60	4.10	1.50
80	2.90	4.40	1.50
90	3.20	4.70	1.50
100	3.50	5.00	1.50
150	4.50	6.50	2.00
200	5.50	8.00	2.50
290	6.40	10.25	3.85

Savings for users in the rural sections will be substantially greater than those in Corinth.

Signing of the contract between the power association and the Tennessee Valley Authority followed acquisition by the TVA of the facilities of the Mississippi Power Co. in nine northeastern Mississippi counties on June 1, for the sum of $850,743.00.

[fol. 3788] COMPLAINANTS' EXHIBIT No. 866 (Excluded)

TVA Press Release of June 12, 1934

Washington, June 12.—Combining electric range and refrigerator, a new kitchen unit designed for the TVA electrification program was accepted this afternoon by Director David E. Lilienthal at the Bureau of Home Economics laboratory, after formal inspection in which he was joined by representative Government officials, electrical manufacturers and dealers, and others interested.

Dual labor-saving services are contained in a compact space-saving unit which may be readily installed in the home. This latest product of the General Electric Company is made particularly for Electric Home and Farm Authority financing of consumer-purchase in parts of Alabama, Georgia, Tennessee and Mississippi where power rates are sufficiently low to encourage the tie-up. The unit, to be handled by regular dealer outlets, will retail at $—.

The General Electric Company is one of 24 concerns manufacturing some 50 electric ranges, refrigerators and water-heaters which have received the EHFA stamp of approval for marketing in the Tennessee Valley.

"The product typifies the spirit and the cooperation of the electric manufacturers," declared Mr. Lilienthal in ac-
[fol. 3789] cepting the pioneer model. "It is the answer to our request for cheap yet practical appliances to enable people of modest means to enjoy the advantages of electricity and at the same time utilize the energy to be created not only in the Tennessee Valley but in other parts of the country where gigantic waterpower developments are under way or projected. The combination of low cost current and appliances, we think, will open up new markets for manufacturers, and retailers, and benefit the utilities as a whole."

[fol. 3790] COMPLAINANTS' EXHIBIT No. 867 (Excluded)

TVA Press Release of June 13, 1934

Details of the Tennessee Valley Authority's efforts to protect the electric investor against the inevitable losses of competition are revealed in the attached exchange of correspondence between Director David E. Lilienthal, in charge of the TVA power program, and C. E. Groesbeck, Chairman

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

of the Board of the Electric Bond and Share Company, of New York.

Knoxville, Tennessee, May 28, 1934.

Mr. C. E. Groesbeck, Tennessee Public Service Company, [fol. 3791] 2 Rector Street, New York, New York.

DEAR MR. GROESBECK:

On November 25, 1933, the people of Knoxville voted to acquire or construct an electric distribution system. Thereafter the City entered into a contract with the Tennessee Valley Authority for the purchase of power at wholesale to supply such a distribution system. On March 3, 1934, representatives of the City of Knoxville offered to buy the distribution facilities of the Tennessee Public Service Company within the City of Knoxville. That offer was rejected by you. You pointed out that the Company should not be asked to sell its Knoxville properties without also selling the fringe properties and transmission lines outside Knoxville. These outside properties obviously the city could not buy.

In order to carry out the mandate of the electorate the city has proceeded with plans for the construction of an electric distribution system in Knoxville, to be supplied with power from the Tennessee Valley Authority. The plant will compete with the distribution system of the Tennessee Public Service Company in Knoxville.

Such duplication of facilities and territorial competition [fol. 3792] in the area of its operations the Tennessee Valley Authority has consistently sought to avoid wherever there was a reasonable alternative. Accordingly, the Board authorized me to indicate the Authority's willingness to purchase the electric facilities of the Tennessee Public Service Company, both inside and outside of Knoxville, such facilities to be thereafter sold back to the various municipalities in the Company's territory. These negotiations have been going on for three months, and have absorbed a large part of your time and mine. The Authority has had the assistance of our technical staff and, at the direction of the President, of an accounting investigation conducted by the Federal Trade Commission. Because the City of Knoxville is about to let contracts for the construction of the first

section of the proposed distribution system, it is essential that the negotiations between Tennessee Valley Authority and Tennessee Public Service Company looking toward purchase be brought to a conclusion.

On behalf of the Board, I have heretofore made you certain definite proposals for the purchase of electric property of the Tennessee Public Service Company. None of these offers has been acceptable to you. This letter constitutes a [fol. 3793] final offer. In order to do everything within reason to prevent a competitive situation in Knoxville and protect bona fide investors in useful property, the Authority's offer embraces not merely the Knoxville property but also all of the Tennessee Public Service Company's electric properties which are for sale; it also provides a means of putting the Company's street railway property on an earnings basis, in lieu of a continued deficit as in the past.

The Authority hereby offers to enter into a contract with the Tennessee Public Service Company, the details and phraseology to be agreed upon later, for the purchase of all of the electric transmission and distribution property of the Company, including substation facilities and real estate appurtenant thereto, office buildings and electrical supplies and equipment, but excluding the Company's 110 KV. transmission line extending from Waterville to Kingsport. This latter line you have indicated is not for sale. The Company is to retain generating facilities and real estate in connection therewith.

The Authority will pay $5,250,000 for the property in question, payable, at the option of the Authority, in cash upon delivery, or with not less than $1,500,000 cash and the balance payable over a period of not over five years. [fol. 3794] The Authority will pay 6% interest upon unpaid balances, but shall have the right to accelerate the payment of such balances.

As a part of the contract the Authority will agree to give its assistance in improving the revenues of the Company's local transportation system in and adjoining Knoxville, by undertaking to secure the active cooperation of the city of Knoxville in a joint program of ride-building. An increase in net income of $12,000 per year is estimated to result from such program. It will further use its best

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

efforts to induce the City to relieve the company of its present obligations to maintain and repair its track zone, with a saving to the Company estimated by your Manager of $35,000 per year. The Council Committee on Power, the Mayor and the City Manager have already expressed their intention of supporting these measures in the event of the sale of the electric properties. Furthermore, I am advised that if the street railway property, now running a deficit of $40,000 a year after depreciation, is written down from $4,000,000 to $3,000,000, that there will be an additional saving in the way of reduced taxes of about $22,000 a year, and there will be an additional saving in depreciation expense of $30,000 a year.

[fol. 3795] The Authority will establish an exchange point with the Company at Waterville, Tennessee, utilizing the Company's substation facilities at that point for the purpose, and will enter into an interchange agreement which will provide for mutual stand-by service at such point. The Authority will agree to transmit for the Company, at Waterville to an agreed point in Knoxville, such power as the Company may need for the operation of its transportation system, without charge for the transmission, but with a reasonable allowance for line losses. Should the Company prefer, the Authority is willing to supply its energy requirements for transportation purposes at the Authority's standard rates, representing an annual saving to the railway of about $10,000 under present costs.

I take it it is not appropriate that in this letter I go into the details of the basis for the foregoing offer which we have discussed in such detail. The essential facts are as follows.

The undepreciated rate base of the Whole Company as fixed by the Tennessee Railroad and Utilities Commission is approximately	$12,000,000
[fol. 3796] The transportation properties are in the rate base at	4,000,000
This leaves a balance for electric properties of	$8,000,000
You retain the Waterville-Kingsport transmission line (a self-supporting unit) which is in the rate base at	1,300,000
Leaving a balance of electric property of	$6,700,000

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

You have on your books a minimum of property not used or usable, plus superseded property of	700,000
Leaving a total for electric properties of	$6,000,000
You have on hand cash and cash items of $1,700,000 of which there is available for these purposes not less than	$1,200,000
Leaving a balance of	$4,800,000
Against which you have our offer of	$5,250,000

Or we can state the proposition in another way: We are offering to buy all your electric property which you are in a position to sell at a price which covers the very maximum of the value on which you have been earning a return, [fol. 3797] which rate base has been accepted by the Company and has been the basis of its operations. The Company is left with a transmission line which is self-supporting under a guaranteed income provided by contract between the Carolina and Appalachian Companies. As to the street railway, we are proposing a plan in cooperation with the City which, for the first time in many years, will take that property out of the red and give it substantial earnings. At the present time it is subsidized by electric users, contrary to law.

Looking at the matter from the point of view of your capitalization, we have this situation: You have a total capitalization of $17,780,000; $7,780,000 in bonds, $5,000,000 in preferred stock, 85% of which is held by National Power and Light Company, and $5,000,000 in common stock, all of which is held by National Power and Light Company.

According to the report to the President of the United States of the Federal Trade Commission's accountants, the difference between your capitalization and the rate base is accounted for by certain write-ups effected at the time of the re-organization of this Company late in 1930. This [fol. 3798] report indicates that as between October 30, 1930, and the following day, November 1, 1930, without any addition to property, the assets were written up $4,560,442.34. This write-up, together with other appreciation of property at the time of the re-organization, totals $4,945,117.78. With the elimination of this write-up by writing off

the common stock of $5,000,000, there is close agreement between your capitalization and the rate base of $12,000,000. Inasmuch as the Tennessee Valley Authority's offer of $5,250,000 is a fair one as measured by the rate base of $12,000,000, it is also, therefore, a fair one as measured by the capitalization after write-ups have been eliminated, i. e., about $12,000,000.

This offer is contingent on the ability of the Authority to negotiate a satisfactory contract with the City of Knoxville whereby the City engages to acquire the distribution system within its corporate limits.

The City of Knoxville, as you know, is engaged in the preliminary work of constructing its own distribution system. The City has advised that by June 15 it will be required to make extensive commitments to contractors which will preclude the possibility of purchasing the existing plant. [fol. 3799] In view of the public demand in Knoxville for a publicly-operated electric system, it is imperative that this matter be disposed of promptly. The offer made in this letter will, therefore, expire on June 14, 1934.

The right of the people of Knoxville to serve themselves with electricity, and to become part of the President's "yardstick area" is surely not open to doubt. The foregoing proposal gives effect to that right, and yet protects the electric investor against the inevitable losses of competition.

Very truly yours, Tennessee Valley Authority, by
David E. Lilienthal, Director and General Counsel.

DEL.JH.

National Power & Light Company,
Two Rector Street,
New York

June 8, 1934.

Mr. David E. Lilienthal, Director and General Counsel,
Tennessee Valley Authority, Knoxville, Tennessee.

[fol. 3800] DEAR MR. LILIENTHAL:

This will acknowledge receipt of your letter of May 28th in reference to the purchase by you of certain property now owned by the Tennessee Public Service Company. The de-

lay in answering is due to the fact that it did not reach my office until May 31st and the week-end prevented us from holding a meeting of the Board of Directors of National Power & Light Company until Monday of this week. This Company has a large investment in the Tennessee Company. We wished also to give your letter the deliberation it deserves because the acquisition which you propose that the Federal government should make may well be, and perhaps must be, a precedent for the future, and precedents should be as carefully established as they are likely to be regarded.

At the outset permit me to state that we appreciate the spirit of cooperation with which you have approached this difficult problem. As I have many times said to you, we are desirous of cooperating with the Government's Tennessee Valley Experiment to the greatest possible extent but in so doing we must perform the duty with which we are charged in protecting the large number of investors who have actually invested their money in the securities of the Ten- [fol. 3801] nessee Company all of which securities were issued with the approval of duly constituted and lawful authority.

We freely admit the right of the people of Knoxville to serve themselves with electricity and to become part of the President's "yard-stick area." However, consideration should be given to the following facts regarding the Tennessee Public Service Company and those who have their money invested in its property. The Tennessee Company owns and operates electric distribution properties and a street railway system in Knoxville, electric distribution properties serving some twenty-four communities and a considerable number of rural customers elsewhere in Eastern Tennessee and an extensive transmission system for supplying hydro-electric power to these properties. All of these properties comprise a single corporate and physical entity. All have been financed through one capital structure and all are subject to the same mortgage. The property is operated as a unit and in order to fulfill the obligations to the public to render dual electric and transportation service these properties can best be operated jointly, whether [fol. 3802] such operation be under governmental or private auspices. The transportation business in Knoxville in itself

is not self-supporting nor is the electric business by itself in some of the small communities and rural districts.

The Company is a going concern with a long and successful history behind it. It is rendering the best service to its customers at reasonable rates approved by the State Commission and is paying its bond interest and earning a return for its stockholders. Except for the situation which has arisen through the activities of the Tennessee Valley Authority in the territory, supplemented by the agreement of the Public Works Administration (another agency of the Federal Government) to provide the City of Knoxville with $2,600,000 ($600,000 by way of gift and $2,000,000 on loan at 4% interest) with which to build a competing electric distribution system in Knoxville, there is every reason to believe that the Company could and would continue to live and prosper. Large amounts of money have been invested by a great number of people in this Company in reliance upon the protection of the laws of the United States and the State of Tennessee. There is every reason to believe that the street railway situation could be worked out over a reason-
[fol. 3803] able period of time to the satisfaction of all concerned and that these security holders would continue to receive a fair return upon their investments were it not for the activities of the Tennessee Valley Authority and the competition made possible through Federal funds. The Company is not a willing seller and it seems to us that if the Federal government desires to change the sotuation and that the electricity served in the territory by governmental agencies it should in all fairness return to these investors the money which they have invested. Under the extraordinary circumstances surrounding this case we have not at any time suggested that you do more than provide for the bonds and preferred stock of the company.

You have offered to purchase for $5,250,000 a large part of the Company's electric property. This offer, entirely aside from its adequacy, will not pay off the bonds. Your counsel, as well as our own, agree that this must be done before the properties you desire to purchase can be released from the lien of the two mortgages. Until these properties are so released we are at a loss to understand how we are in a position to sell them to you. Even if the price were fair
[fol. 3804] and it were possible to accomplish the release

from the liens of the mortgages, the Company would be deprived of its best properties and would be left with property which even with your helpful suggestions as to relief as to the railway, we feel will be unprofitable.

We appreciate and our security holders must likewise appreciate the situation in which they are placed and that they are faced either with ruinous competition made possible by agencies of the Federal government or with selling at such price as you may offer. Under the constraint of these circumstances we repeat again that in a desire to cooperate to the greatest extent possible with the Government's Tennessee Valley program we are prepared to evacuate the territory served by this Company, so that you may conduct your experiment unhampered by competition, provided our security holders are dealt with fairly.

We know it is the desire of yourself and the Federal government to deal with those security holders fairly and justly, but we think the offer you have made does not accomplish this end as it will not even pay off the bonds much less allow anything for the preferred stock.

[fol. 3805] There are some points in your letter of May 28th that should be clarified.

First. We think that it should be recorded that the construction of the proposed competing system in Knoxville is made possible only by the grant to the City of Public Works Administration funds to the extent of $2,600,000, of which $600,000 is an outright gift and $2,000,000 a 4% loan, and also that the offer of the City to buy the Company's local distribution system was not in cash but in bonds which at the time were quoted in a very limited market at about 75% of par. This offer was impossible of acceptance because it would take for an inadequate price the principal source of the Company's revenue and leave it with its unremunerative property.

Second. There seems to be a misunderstanding as to the Company's 110 kv. transmission line extending from Waterville to Kingsport. We offered to sell you all of the property of the Company or all of the stock of the Company owned by National Power & Light Compan . We are willing to sell you this transmission line along with the other property you indicate.

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

Third. We think our security holders should know some-
[fol. 3806] thing of the permanency of the street railway arrangements you suggest and what is meant by your offer to put it on an earnings basis, that is, will it merely pay operating expenses and no more or on what investment will it earn interest. For how long will the City agree to the reduced taxes of $22,000 a year and to relief from repair to track zone? They should likewise be informed of the length of time the Authority is willing to transmit power for the operation of the Railway system, and if the Company accepts your offer also to supply such power, for how long a time and on what terms the Authority will supply it.

Fourth. We notice that at your option you can pay us in cash either at one time or in deferred payments. As you are somewhat familiar with our mortage problems we assume you intend that the mortgages will remain a lien on the property until the final payment is made. However, I think our security holders should be definitely informed as to this and as to how you propose to take title and operate these properties until final payment.

Fifth. Our computation of the electric rate base is different from that contained in your letter and is as follows:

[fol. 3807] The rate base of the whole Company at December 31, 1933, exclusive of $500,000 working capital was $12,123,576

Deducting the transportation properties which are in this rate base at 4,042,606

Leaves a balance for electric properties 8,080,970

To this should be added the electrical supplies and equipment on hand covered in your offer and not included in any of the figures above of approximately 100,000

Total of 8,180,970

Less the amount of miscellaneous property included in the electric rate base excluded from your offer 700,000

Leaving a total of 7,480,970

If the Waterville-Kingsport transmission line is retained (although we again renew our offer to sell) it is in the rate base at 1,292,334

Leaving a balance of 6,188,636

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

Against which we have your offer of..... 5,250,000
Or less than the rate base of the property which you propose to buy by..... 938,636

[fol. 3808] From the foregoing it will be seen that your offer for the property you desire to acquire is almost $1,000,000 less than the rate base and does not give the company an excess of $450,000 as computed by you.

We do not understand why in your computation you deduct the $1,200,000 cash from the rate base since this money has no relation to the property included in the rate base nor does any of it represent or stand in lieu of any of the property included in the rate base.

Sixth. You state that the Waterville-Kingsport line is self-supporting. The contract which makes this so expires on December 31, 1938.

Seventh. The transportation system is necessary to the city of Knoxville. In the public interest it can best be operated jointly with the electric property whether such joint operation be conducted under governmental or private auspices. The Tennessee Commission and the Company have in the past deemed it in the public interest to treat the electric and street railway properties together, this policy having been pursued in cases affecting other companies. This had been done by this company pursuant to the wholesome policy of the Commission and, we are advised [fol. 3809] by counsel, is not in any sense illegal or contrary to law as suggested in your letter.

Eight-. You make reference to the capitalization of the Company and to a recent investigation by the Federal Trade Commission and in this connection you refer to "certain write-ups." At the time of the re-organization in 1930 the plant accounts were restated to reflect the values determined by an independent valuation engineer, which values were substantially in agreement with a detailed inventory and appraisal made in 1920 by engineers for the State Commission and the Company, plus actual cash expenditures for improvements and betterments from then until the date of re-organization. Also National Power & Light Company, at the time of the re-organization, put $1,000,000 in cash

into the Company, in addition to its large investment already made so that at the date to which you refer the capitalization was in accord with the value of the assets. The facts as to capitalization have been before the Authority since the early stages of our negotiations. The re-statement of plant accounts (so-called "write-ups") at the time of re-organization was entirely justified and proper and furthermore it has no bearing on and is not pertinent either directly or collaterally to the negotiations now at hand since [fol. 3810] at no time have we ever suggested anything more than that the investors in the bonds and preferred stock be taken care of.

Ninth. We think the security holders should be informed as to what provision is to be made for cancellation of contracts, leases, and all other items that must be settled on account of the closing down of the Company's electric business, and the disposition of property jointly used by the electric and transportation departments some part of which is included in the rate base of the transportation properties. Among these contracts is a power contract with the Carolina Power & Light Company under which the Tennessee Company will be required to pay an amount equal to the two-year minimum in order to effect the cancellation of this contract. This minimum is $534,000 for each year, less such power as the Company may require during the year for the operation of its remaining properties. If the Tennessee Company avails itself of the offer of the Authority to sell its power for railway purposes, the Tennessee Company would be obligated to pay the Carolina Company the full specified two-years minimum. This payment is required by [fol. 3811] the terms of the contract and does not cover the loss to be sustained by the Carolina Company through the permanent severance of this business.

* * * * * * *

If the holders of the bonds or the preferred stock of the Tennessee Company are to be confronted with the necessity of accepting less than the amount of their investments or with facing destructive competition, then there would seem to us to be open for consideration the following alternative lines of procedure.

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

I

Tennessee Public Service Company might take the necessary corporate action as rapidly as possible, which should not require more than about two weeks, to give you an option for a reasonable period to acquire all of its electric properties, including the Waterville-Kingsport line, (with some reasonable reservation for the transmission of power over it), the power house and material and supplies having a rate base of $8,180,970, in return for disposal by you of all of the Company's bonded indebtedness of $7,780,000 principal amount. Without exceeding the redemption price of the bonds you would obtain complete and practically immediate control of the situation (you in the meantime to cause [fol. 3812] that status quo as respects competition and preparation for competition to be preserved.) In carrying out the program we think it would be unnecessary for the Authority to take ownership of the bonds.

While the stockholders of the Company (after discharging the obligation to Carolina Power & Light Company under the existing power contract) would be left with only a small part in value of their actual investment, nevertheless in order to avoid the consequence of competition with which the security holders are threatened, we would propose to the stockholders that they approve the transfer to you of the properties upon cancellation through your efforts and at your expense of all bonded indebtedness. The responsibility for dealing with the bondholders shall be solely yours.

II

If the foregoing is unacceptable to you, then we suggest, in view of the precedent to be established here, its far reaching effect on security holders generally and the difference between us, both as to figures and basic principles involved, that, with the approval of our security holders, the whole matter be submitted to arbitration—you to appoint one arbi- [fol. 3813] trator, we to appoint one and the third to be appointed by the Chief Justice of the United States.

If our security holders are to be confronted with accepting the $5,250,000 which you propose, or with facing destructive competition, then we believe that the problem must be taken

directly to the security holders, as obviously the Board of Directors of the Company could not, even if it were so disposed, give away any of the assets of the Company.

It is, we believe, the opinion of your counsel, as well as our own counsel, that the properties which you propose to purchase cannot be released from the mortgage liens, except by complete discharge of the two mortgages. Since the amount you offer is not sufficient to discharge the bonded indebtedness of the Company, the desired properties could not be sold to the Company's bondholders' committee. While such an organization could probably be started reasonably promptly it would require some time and expense to comply with the Federal Securities Act, to procure the necessary deposits of bonds and to get the necessary binding acceptance from the bondholders.

[fol. 3814] The stockholders would also have to be dealt with. If any proposition were submitted to them which would leave little or nothing for their investment, there is considerable question as to whether or not those who might be asked to vote stocks held by corporations, trust estates, institutions, etc. could legally vote in favor of the proposition and there is the practical question as to whether or not individual stockholders could be induced to vote their stock for a proposition which would in effect wipe out its value. So far as the National Power & Light Company is concerned, the legal question presented might be met by acting upon a vote of instructions from the stock of the National Company held by the public. Whatever the detailed procedure might be, it would be of course necessary to have action by the stockholders of Tennessee Public Service Company and it would be essential to work out some plan which could, as a legal and practical matter, get the necessary stockholders' approval.

We realize that this situation presents a perplexing problem to you as well as to ourselves and we sincerely hope that the suggestions herein may form the basis for a solution of the situation which will not entail too heavy a sacrifice [fol. 3815] on the part of the security holders.

Yours very truly, (Signed) C. E. Groesbeck.

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

June 12, 1934.

Mr. C. E. Groesbeck, Chairman, Board of Directors, Electric Bond and Share Company, 2 Rector Street, New York, New York.

DEAR MR. GROESBECK:

This will acknowledge receipt of your letter of June 8 replying to the Authority's letter of May 28 wherein an offer was made for the purchase of properties of the Tennessee Public Service Company.

The attitude expressed in the early pages of your letter toward the agencies of the public which are involved in this situation disturbs me a great deal for it may be a greater barrier to an agreement than the controversies respecting dollars and cents. You refer to the activities of the Tennessee Valley Authority in the area and to the loan and grant to the City of Knoxville by the Public Works Administration very much as if these two agencies were outside interests plotting the destruction of your business. [fol. 3816] You seem to forget that both the Tennessee Valley Authority and the Public Works Administration are instrumentalities of the people of the United States; that their activities which you thus decry are in execution of policies of the entire nation formulated under the constitution by the President and the Congress.

To my mind it seems clear that the public interest must come ahead of every other interest of whatever kind or character. Fairness to private investors is, however, an essential of sound public policy and our offer is based on this promise. Anxious as I am to keep these negotiations strictly on the plane of facts and figures I can not pass over the statements in your letter which depart from this basic principle without recording my earnest and vigorous disagreement. You offer to sell the Waterville-Kingsport 110 kv. transmission line. The Authority is willing to include this line in its offer at the cost to you of $1,292,000. This is on the understanding, however, that the contract for the use of this line by your affiliate, Carolina Power and Light Company, whereby Tennessee Public Service is compensated for the use of the line, shall be assigned to the Authority for the balance of its term on the same terms and

conditions. This makes our offering price $5,250,000 plus [fol. 3817] $1,300, for this line or a grand total of $6,550,-000.

In round numbers with your cash on hand of $1,700,000 you will have cash of $8,250,000, enough to pay off all the bonds at par with a substantial balance for stockholders, of cash and of operating property. This remaining property under our plan will be on a basis of net earnings after expenses and depreciation.

You and I have spent many days in the past three months during which you have been most patient and courteous discussing what would be an adequate price for these properties. It would be pointless for me to record here our reasons for believing the Authority's offer as here supplemented a reasonable one or to answer in detail each of the many points raised in your letter of June 8. I should emphasize, however, that the rate base of the total property $12,000,000, discussed in our letters is undepreciated. The fact is, of course, that the property has depreciated since the items were installed and is worth less than when new. The accrued depreciation on the property as a whole is not far from twenty per cent which on the rate base figure of $12,000,000 means that $2,500,000 is to be deducted in de-[fol. 3818] termining present value. I need not here make similar computations as to electric property only, nor on different conditions per cent. The point is that our offer on a property basis is fair to the company.

The Board disagrees with your conclusions as to the relation of the street railway and electric businesses. I have gone over this with you and your associates at such length that I see no point in again setting out our reasons. The fact that your Company has not in past years made provisions for the foreseeable obsole-cence and ultimate retirement of this property out of current operations as other utilities all over the country have done offers no reason why the Federal Treasury should now accept the responsibility to bail out this white elephant. The offer of the City to abate the Company's track zone maintenance and repair obligations and the suggestion toward lessening the tax burden I understand from representatives of the city are to be permanent. The Authority's offer respecting power supply is for any reasonable period you may suggest,

COMPLAINANTS' EXHIBIT No. 867 (Excluded)

not to exceed ten years. The rates are the Authority's standard wholesale rates to industrial customers, copy of which your Mr. Root has in his files.

[fol. 3819] You have correctly pointed out that the method of payment set out in our letter of May 28 introduces some complications. On tender of conveyance satisfactory to our counsel the Authority is ready to pay the entire purchase price in cash. If expected appropriations are made available this letter supplements the Authority's offer of May 28 and is extended on the same conditions as are set out in that letter, except that the date of expiration of the offer is extended to include June 20, a week from your receipt of this offer.

The Tennessee Valley Authority has entered into these negotiations in an effort to find a peaceable and constructive way of carrying out a public purpose, a national policy declared by the people of the country through their President and their Congress.. We trust that your letter setting up as it does an unacceptable proposal and an unacceptable principle does not mean that these efforts toward peace be abandoned.

Very truly yours, Tennessee Valley Authority, by David E. Lilienthal, Director and General Counsel.

[fol. 3820] COMPLAINANTS' EXHIBIT No. 868 (Excluded)

TVA Press Release of June 22, 1934

Jackson, Tenn.—June 22—The Tennessee Valley Authority not only is working toward a better balanced economic life for the Tennessee area, but it is as well pointing the way toward a better balanced economic life for the nation, David E. Lilienthal, Director in charge of power for the TVA told a mass meeting of civic leaders from several West Tennessee cities here today.

"The Tennessee Valley project translates into concrete form a vision of President Roosevelt," he said. "The project was born in his mind, and it is being carried forward under his guidance. It is part of a program for national development. It is not a local project. Its implications extend to the outermost reaches of this country.

COMPLAINANTS' EXHIBIT No. 868 (Excluded)

It is this objective that justifies the huge expenditure of Federal funds in one section of the County."

Creation of the Authority, he said, is a great tribute to the South, but he added that at the same time it is a challenge to the South.

"It is a challenge," he said, "because it calls for the highest degree of leadership among the men and women of this area.

"I am not an alarmist, but I want to warn you that [fol. 3821] powerful forces are at work to deprive the South of the greatest opportunity which ever came to any people. A year ago the disciples of greed and blindness that brought this country to the verge of a collapse had hurried into the storm cellars, whimpering and crying for help.

"Now that a courageous leadership has enabled the country to weather the storm, these selfish and ignorant forces are coming out of the storm cellars and once more getting in their deadly work.

"The people of the country must choose whether to follow the leadership of the President or the leadership of the selfish and blind that brought us so close to destruction.

"The first great test is in your hands here in the Tennessee Valley. Under the cover of various disguises, powerful forces are at work to destroy the long-time objectives of the Tennessee Valley Authority. In order to fill their own pockets, these powerful groups are ready at any cost to destroy the Tennessee Valley Authority's program and to keep the President's objectives from being fulfilled.

"Whether the people will win or the disciples of selfishness and blindness will win depends on you. There is no force, [fol. 3822] however powerful, however subtle, however firmly entrenched, which can withstand the force of a united public opinion."

Urging his audience to refuse to listen to the voices of "those of little vision and of selfish purpose," Mr. Lilienthal said the program would succeed "only if you of the Valley treat this as a national program".

Mr. Lilienthal laid emphasis on the point that the Authority's program is not a local project.

"Its implications extend to the outermost reaches of this country."

COMPLAINANTS' EXHIBIT No. 868 (Excluded)

He said that program for a better balanced economic life must begin with the fundamental proposition that the purchasing power of the average man and woman must be increased and must be stabilized.

"This is the cardinal point in the work of the Tennessee Valley Authority which underlies all of its activities," he said. "This is no over-night job. We are here at grips with the most desperate problem of modern life, a problem [fol. 3823] which has swept away the democratic form of government in most of the countries abroad. But in our own country, fortunately for the American people, this struggle to increase and stabilize the income of the average man and woman will be carried on, as the President has said, under the principle of 'self-help and self-control'.

"Increasing and stabilizing the purchasing power of the people involves at least two points; first, the income which the people now have must be made to go as far as possible; and second, there must be new sources of income.

"The electric program of the Tennessee Valley Authority has particular reference to increasing the available income of our people through making the consumer's dollar go further, both in securing for him more electrical energy for his dollar through lower rates, and by making possible the purchasing of electric appliances at lower costs. The Authority's program of working with the people of the area in developing large-scale and small-scale industry is designed to produce additional sources of income."

TVA Press Release of June 23, 1934

David E. Lilienthal issued the following statement today concerning the electric distribution systems in northern Alabama:

"After further negotiations the TVA today received a revised offer for the sale to the TVA of the electric distribution properties of the Alabama Power Company in North Alabama.

COMPLAINANTS' EXHIBIT No. 869 (Excluded)

"The price fixed is one with which the Authority is in substantial, though not entire, agreement, provided the final figure is likewise agreeable to the municipalities involved, inasmuch as the plans contemplate resale of these properties to the communities.

"The Authority will confer with them at an early date to learn whether such a program is acceptable to them, or whether they prefer to press their applications for loans from PWA with which to construct new plants.

"The Authority believes that the purchase at a fair price will be in the public interest, as it will eliminate the delay involved in completing new distribution systems, and will avoid substantial losses to investors arising out of competition."

[fol. 3825] COMPLAINANTS' EXHIBIT No. 870 (Excluded)

TVA Press Release of July 1, 1934

Surveys are under way to determine the most feasible sites for additional dams on the Tennessee River and tributaries, Arthur E. Morgan, Chairman of the TVA, announced today. The surveys and studies are being made under the direction of Carl A. Bock, assistant chief engineer.

"Contrary to widespread opinion," Mr. Bock said, "definite sites for additional dams have not been located. Before this can be done many time-consuming operations are inevitable.

"First, it must be determined where additional dams would be of most value in a progressive, integrated development of the entire Tennessee River watershed, having in mind the well-being of all citizens.

"These studies require time. A detailed topographic survey which enables engineers to compute the length and height of the dam, the cubic yards of earthwork and concrete involved, best arrangement of power house, spillway and other auxiliary structures, and other problems must be worked out. Of vital importance is the nature and condition of the foundation, and it must be thoroughly explored; perhaps more than anything it influences the cost of the [fol. 3826] dam. This usually takes several months. Frequently dams are located in such inaccessible places that

COMPLAINANTS' EXHIBIT No. 870 (Excluded)

special highways must be built to handle the enormous amount of materials. A study of the flow of the river, of the capacity of the reservoir and of the cost estimates on each of the sites that appear most favorable, must be made. And finally, after the exact location is decided designers and draftsmen must make the actual working plans. More than a thousand drawings had to be made before work on Norris Dam could start."

Mr. Bock said that residents of the Valley should regard the Authority's power development as a single unit, rather than as the creation of a number of individual power dams. "It's an error of judgment for the people living near the upper tributaries, for instance, to believe that a storage reservoir there is for the particular benefit of persons living elsewhere in the Valley," he said. "We are not proposing to build seven or eight separate power dams, operated individually for the benefit of the immediate vicinity. All dams, wherever located, will be linked by transmission [fol. 3827] lines and will thus form a single system. Regard the whole project as 'one huge dam,' if you wish to put it that way. No matter in which section of the Valley the electricity is generated, it will be available to all sections. But each of these individual dams, under construction, or in contemplation, is needed to create this unified, integrated system.

[fol. 3828] COMPLAINANTS' EXHIBIT No. 871 (Excluded)

TVA Press Release of July 6, 1934

David E. Lilienthal, Director of the Tennessee Valley Authority in charge of power, today announced the submission of a plan to the communities of north Alabama which will make cheap power available immediately in this area. The cities involved are Courtland, Decatur, Falkville, Hartselle, Moulton, Red Bay, Russellville, Town Creek, Cherokee, Leighton, Tuscumbia, Sheffield, and Florence.

These communities have attempted, without success, to purchase existing Alabama Power Company facilities. The announcement of the Authority stated that TVA has secured

an option on such facilities at fair prices and that, under the proposed plan, these facilities would be taken over immediately by TVA, which would re-sell them to the various municipalities when the facilities have been improved and expanded and the municipalities were in a position to take them over. The details of the plan are as follows:

1. The TVA will buy the distribution systems in these cities from the Alabama Power Company and will then proceed to rehabilitate the properties and to add thereto a number of farmers' lines.

2. TVA will then operate these systems directly for a [fo]. 3829] limited period, selling cheap Muscle Shoals power to the consumers in this territory.

3. When the systems have been improved and expanded and the municipalities are in a position to take them over, TVA will transfer these systems to the municipalities which will pay for them out of surplus plan earnings, without the necessity of making a cash outlay or pledging their credit. Until the systems have been completely paid for by the municipalities, the rates to be charged will be the regular TVA rates plus a 10 per cent surcharge. By means of this surcharge, it is contemplated that the systems will be completely free of debt, interest and amortization in ten years or less. After providing for all costs and obligations, the balance of the earnings in this area, during the period of direct operation, will be used for reducing the purchase price to municipalities.

4. TVA and its subsidiary, Electric Home and Farm Authority, will engage in an intensive program of domestic, industrial and commercial load building in this territory, utilizing EHFA facilities, making available low priced electric appliances to consumers upon the EHFA long term financing plan.

[fol. 3830] COMPLAINANTS' EXHIBIT No. 872 (Excluded)

TVA Press Release of July 14, 1934

Carl A. Bock, assistant chief engineer of the Tennessee Valley Authority, today made the following announcement concerning a dam on the French Broad River near Asheville, N. C.:

"The Tennessee Valley Authority has been importuned by many people to prepare designs for a water power dam and regulating reservoir on the French Broad just above Asheville. The topography of this site affords a natural reservoir basin which, considered for its physical aspects alone, is one of the best of such sites in the Tennessee Valley. However, the preliminary data available at the present time regarding this proposed project appear to indicate that the cost of water power produced there would be so much greater than the cost of similar power produced at other locations, that we are forced to the conclusion that the construction of a dam at this site is not economically justified at the present time."

[fol. 3831] COMPLAINANTS' EXHIBIT No. 873 (Excluded)

TVA Press Release of July 15, 1934

Athens, Ala.—July 15—Consumers of electricity in Athens, Alabama, received greatly reduced bills for the month of June, the first bills to be figured at the now low TVA rates. In all cases consumers found substantial reductions ranging from 40 to 70 per cent on their electric bills. The contract between the City of Athens and the Tennessee Valley Authority became operative on June 1, 1934. Before that time the City was buying power from the Alabama Power Company, and was then charging for electricity at rates much higher than the present TVA rates.

[fol. 3832] COMPLAINANTS' EXHIBIT No. 874 (Excluded)

TVA Press Release of July 15, 1934

The Tennessee Valley Authority will furnish low cost TVA power to the 13 cities and towns of northern Alabama

COMPLAINANTS' EXHIBIT No. 874 (Excluded)

which have requested service under a plan recently announced by the Authority.

David E. Lilienthal, TVA director in charge of power, announced today that the Authority's option on the properties now owned by the Alabama Power Company would be exercised.

"All of the thirteen cities and towns in North Alabama have now formally requested the Tennessee Valley Authority to put into effect the plan recently laid before them," Mr. Lilienthal said.

"The Authority will, therefore, proceed to exercise its option to purchase transmission and distribution facilities in North Alabama. Thereupon a petition will be filed with the Alabama Public Service Commission requesting its approval of the transfer of these distribution facilities from the power company to the TVA. Such approval is necessary before a transfer can be effected. With such approval [fol. 3833] of the Commission, and a transfer of title, Muscle Shoals power will be available to homes, farms, and industries in these six counties without further delay.

"The Electric Division has already completed its plans for the substantial rehabilitation and extension work which is part of the plan. The long effort of the people of these communities to obtain the benefits of Muscle Shoals power at low rates is about to be realized.

"The prompt action of the municipalities of North Alabama in cooperating with the Tennessee Valley Authority in this matter is further evidence that the people of Alabama are solidly behind the President's program."

The municipalities soon to be served with TVA power are: Courtland, Decatur, Falkville, Hartselle, Moulton, Red Bay, Russellville, Town Creek, Cherokee, Leighton, Tuscumbia, Sheffield, and Florence.

[fol. 3834] COMPLAINANTS' EXHIBIT No. 875 (Excluded)

TVA Press Release of July 17, 1934

After continuous negotiations extending over a period of several months, an agreement has been reached between the Tennessee Valley Authority and the National Power and Light Company, owners of the Tennessee Public Serv-

ice Company, whereby the company's electric property in eastern Tennessee is to be sold to the Tennessee Valley Authority. Consummation of the arrangement is contingent upon approval by the City Council of Knoxville of a plan whereby the Knox County distribution facilities thus acquired by the TVA will be sold to and operated by the City of Knoxville. The transaction is also contingent upon willingness of bondholders to turn in their bonds at the issue price of 96½. The major facts concerning the arrangement between TVA and National Power and Light Company, owners of Tennessee Public Service Company, are as follows as explained by Director David E. Lilienthal, who conducted the negotiations for TVA:

[fol. 3835] 1. The Tennessee Public Service Company will transfer to TVA all of its electric distribution and transmission facilities in East Tennessee, except the transmission line between Waterville and Kingsport, at a price of $6,088,000. This price coincides with the rate base of the property as determined by the Tennessee Railroad and Utilities Commission, less $700,000 deducted for property no longer used and useful, principally the steam generating plant located in Knoxville.

2. The Tennessee Public Service Company will arrange for a tie-in for the interchange of power between the facilities to be acquired from TPS, and Carolina Company, also a National Power and Light Company. This interchange arrangement will insure TVA against any possibility of service interruptions due to storms or other causes and will permit both TVA and Carolina Company to make the fullest and most economical utilization of their power. In consideration of these interchange provisions, the Tennessee Valley Authority will assume the obligations and receive the benefits of an interchange contract between the Carolina Company and the Tennessee Public Service Company which has two years still to run.

3. By the purchase of the TPS property, competition between the TPS and the City of Knoxville will be elimi-
[fol. 3836] nated, and instead, the TVA and the City of Knoxville will acquire a going concern with more than 25,000 customers, together with a personnel trained and

experienced in the operation of this plant. The plans of the TVA do not call for any change in operating personnel except after study and recommendation by the TVA Personnel Division.

4. The TVA policy will continue to be to confine itself primarily to generation and transmission, with local public agencies handling the distribution of electricity. The operation of the distribution facilities by TVA is specifically intended to be temporary, pending transfer to local public agencies. This purchase of distribution facilities is to prevent disastrous losses to investors in TPS arising out of the fact that the City of Knoxville itself was not in position to purchase the company as a whole.

5. The street railway property of TPS will continue to be operated by the company. TVA will undertake to secure the cooperation of the city in an effort to improve the earnings of the street railway company, reduce its expenses, and relieve it of its present obligations to maintain and repair the paving in the track zone.

"I am delighted over the successful outcome of this [fol. 3837] protracted and difficult negotiation," said Mr. Lilienthal. "The result is one which, in the judgment of the Board of Directors, has a sound business basis, permits very substantial savings to consumer immediately, and at the same time does justice to the investor and protects his investment from the impairment and possible destruction arising from competition.

"The contract between the City of Knoxville and the Public Works Administration, whereby PWA has loaned funds for the construction of a competing plant, will, I am advised, be continued in effect until the transaction between TVA and TPS has been consummated. Such consummation depends upon approval by the City Council of Knoxville, and upon the willingness of bondholders to turn in their bonds at the issuing price of 96½, within three weeks. If by August 8th, the company has not been able to get the bonds in at this price, there is no deal, and the City will then proceed to make an award for a new plant, bids on which are to be opened today. I anticipate no such contingency, as the price is eminently fair to the bond-

holders, and has the approval of a committee of conservative institutional holders of these bonds."

Meeting with the Power Committee of the City of [fol. 3838] Knoxville Council today, Mr. Lilienthal explained the plans for operation of the system and acquisition of property by the various governmental units.

The system purchased from TPS supplies electric service to the City of Knoxville to the fifteen communities in Knox County, including Fountain City, and to twelve communities in eastern Tennessee outside of Knox County, including Newport and Jefferson City, he explained. This area has a population in excess of 133,000.

"The plan will result in substantial rate reductions, which will be made at an early date, and will enable the City of Knoxville and neighboring communities to acquire their distribution plants without the necessity of the issuance of bonds or other certificates of debt," Mr. Lilienthal said. "It will preserve without material change the revenues now derived by municipalities from taxes on electric system operations.

"Upon the satisfactory conclusion of pending negotiations, all of the transmission and distribution properties, except the transmission line between Waterville and Kingsport, of the Tennessee Public Service Company will be purchased by the Tennessee Valley Authority for the sum of $6,088,000. For a short interim period these properties [fol. 3839] will be retained and directly operated by the TVA. During this time, the Authority will complete such engineering improvements and changes as are required to put the system into excellent operating condition and will engage in an intensive program of load development under the EHFA program of making available low cost electric appliances. At the end of this interim period, the distribution properties will be turned over to the various municipal and county units in the area which will assume responsibility for distribution operations."

Based upon the present purchase price, transmission properties in the area are valued at $1,509,515 or 24.79 per cent of the total investment, Mr. Lilienthal pointed out. These properties will be permanently retained by the TVA for its wholesale power operations. Upon the same basis, the distribution properties included in the purchase are

valued at $4,578,485, or 75.21 per cent of the total, this sum representing the electric distribution systems which will be ultimately transferred to local operating units. The distribution facilities in Knox County, including the City of Knoxville, are valued at $4,229,625, or 69.48 per cent of the total purchase price.

[fol. 3840] Low TVA rates will immediately be put into effect upon transfer of the properties from TPS to TVA. These new rates will be the standard rates plus a ten per cent surcharge. By means of this surcharge, cost of the system will be amortized. The surcharge will be the same throughout the area, but it may be necessary to maintain the surcharge for a longer period in the area outside of Knox County. It is estimated that the system in Knox County will be completely free of debt, interest, and amortization in from ten to twelve years; the period outside of Knoxville may run from twelve to fifteen years.

During this period of direct TVA operation, the property in the entire area will be treated as a single unit, and the sums available from revenues, after deducting all operating costs, will be used to reduce the price at which the properties will be purchased by local operating units.

Mr. Lilienthal announced the appointment of Lovick P. Miles of Memphis and Judge D. C. Webb of Knoxville, member of the firm of Green, Webb and Bass, as special counsel for the TVA in the TPS acquisition negotiations.

Mr. Miles will devote his special attention to the prep-
[fol. 3841] aration of the various contracts incident to the purchase of the property from the Tennessee Public Service Company. Judge Webb will act as special counsel on title matters. Judge Webb's firm was previously employed to check titles on the property in East Tennessee to be acquired from the Tennessee Electric Power Company under the Commonwealth and Southern contract.

[fol. 3842] COMPLAINANTS' EXHIBIT No. 876 (Excluded)

TVA Press Release of July 18, 1934

The acquisition of electric properties by the Tennessee Valley Authority in the Knoxville area will result in very

substantial savings to consumers in the near future. The new rates to be put into effect will be the standard Tennessee Valley Authority rates plus a 10 per cent surcharge for retiring the investment.

For the entire area, the grand total revenues for the year 1933 were $2,212,343 for consumption of 71,584,000 kilowatt hours. Under the new rates, the bill for the same consumption would be $1,331,365. This reduction in rates will yield to the community an annual saving of $880,978, or 39.8 per cent. The saving for Knox County is estimated at $803,000 per year and for the area outside of Knox County $77,000 per year.

For the entire area, residential consumers will save $374,000, or 50.4 per cent. Commercial users will save $253,000, or 38½ per cent, and industrial users will save $199,000 or 30.6 per cent. Sales to municipalities for street lighting and other purposes in Knox County for 1933 [fol. 3843] amounted to $151,263. For the same consumption the new TVA rates would cost $98,900, or a saving of $52,300 per year.

As compared with the lowest possible rate now available on the TPS lines, a residential user having lights and small electrical appliances would save 81 cents per month, or 38 per cent. A residence user having a refrigerator and electric range, would pay $6.95 under TPS promotional rates, and $5.83 under TVA rate, including 10 per cent surcharge, and would save $1.12 per month. A residence customer with a fully electrified home, including a refrigerator and electric range, water heater, lights, and small appliances, would pay $8.45 under the TPS promotional rate as against $7.15 under TVA rates and would save $1.30 per month.

Commercial users, such as cafes, stores, professional businesses, etc., showed savings running from $1.00 to $15.00 per month, representing reduction from present rates of from 30 to 60 per cent.

Industrial users show savings ranging from 35 to 50 per cent, which will result in immediate expansion in the industrial uses of electricity.

One industrial user with a demand of 50 kilowatts pays $3,288 per year under TPS rates. Under the TVA rates, [fol. 3844] his bill would be $1,980, or a reduction of $1,308.

COMPLAINANTS' EXHIBIT No. 876 (Excluded)

Another industrial user with a demand of 150 kilowatts would save $3,500 per year or 41 per cent. A very large user with a demand of 500 kilowatts and a fairly high load factor would pay an annual bill under TPS rates of $33,180 as against a TVA bill of $17,292. Under the new rates, this consumer will save $15,888 per year, or 47.9 per cent.

Further comparisons showing the marked reductions in rates that will soon be available are shown on the attached tables.

[fol. 3845] COMPLAINANTS' EXHIBIT No. 877 (Excluded)

TVA Press Release of July 18, 1934

"The TVA has been at work seeking to develop new uses for coal, so that the mining area can prosper with the rest of the region, Chairman Morgan said. "In some cases the existence of cheap power leads to a demand for more coal. For instance, the Authority has been negotiating with a large chemical industry which must have very cheap electric power, and also large amounts of cheap coal for chemical processes. The locality which seemed more promising is near a coal mine and also where TVA cheap power is available."

• • • • • • •

"There is no question but that in the years to come coal will be so valuable for use in chemical, metal and other manufacturing processes that it will seem a waste and misuse to use our coal resources for power where water power is available. It is the business of the Tennessee Valley Authority to try to combine both these values—to get the undoubted economics and values of water power, and also to work vigorously to develop new and additional uses for coal so that it will be used in constantly larger quantities.

• • • • • • •

[fol. 3846] A region which has both coal and water power is very fortunate. The combination of the two make possible the development of industries that could not thrive so well with either one alone. Such a development of the highest use of the whole resources is a part of economic planning.

• • • • • • •

[fol. 3847] COMPLAINANTS' EXHIBIT No. 878 (Excluded)

TVA Press Release of July 27, 1934

The Tennessee Valley Authority today approved the contract covering purchase of the Tennessee Public Service Company properties in Knoxville, and East Tennessee, David E. Lilienthal, Director in charge of power, announced. The contract, drawn in a series of conferences at Asheville, North Carolina has been signed by officers of the Power Company. It does not include the Knoxville Street Railway system.

Actual transfer of the properties is contingent upon bondholders turning in their bonds at the issued price of 96½ before August 21, 1934. Each party to the contract also has a right to cancel its obligations if litigation or other contingency arises which in the judgment of either party will unduly delay completion of the purchase.

"This provision protects the city of Knoxville against extended delay in receiving benefits of TVA electricity for which its citizens voted", Mr. Lilienthal explained. "The City has opened bids for construction of its own system with which to distribute TVA electricity. If there is unreasonable delay in closing the sale, TVA will rescind the con-
[fol. 3848] tract and the city can immediately construct a competing system."

Mr. Lilienthal explained that TVA has arranged with the Guaranty Trust Company of New York, whereby bondholders desiring to deposit their bonds under the agreement with TPS may deliver those bonds to the Guaranty Trust Company as the agent of TVA and receive in return TVA certificates of deposit. This certificate of deposit will entitle the bondholder to receive $965 for each bond turned in, (that is, 96½) together with accrued interest, if the deal goes through; if it does not go through, he is entitled to receive his bond back at the expiration of the period. Formal announcement of this deposit agreement plan will be made in a few days as soon as the necessary details have been worked—

The contract approved today embodies the general agreement between TVA and the electric company as announced on July 17th, with adjustments for contracts held by the Tennessee Public Service and real estate in which Knoxville Street Railway Company held a joint interest with the

electric division of the company. These adjustments are, as explained by Mr. Lilienthal:

[fol. 3849] (1) Tennessee Public Service Company has a power contract with Carolina Company whereby it is obligated to purchase all of its power requirements from Carolina Company at a rate very much in excess of the rate at which TVA sells power at wholesale to municipalities. This contract terminates June 4th, 1936. As a part of the purchase plan, TVA is assuming this contract with the Carolina Company, but the contract has been substantially modified. Instead of being obligated to take and pay for all of its power requirements, TVA's obligations are limited to a demand of 20,500 kw., and a consumption of 19,320,000 kwh. quarterly, with TVA free to use any other source of supply for its excess requirements. Instead of purchasing power at the former high rates, TVA will purchase at its standard wholesale rate, except that the billing period will be three months instead of one month, thus giving the TVA the benefit of lower brackets for a large amount of power. TVA will make a lump sum payment of $150,800 when it takes over the TPS properties and thereafter will pay quarterly for the power it takes under the contract.

(2) Under the contract TVA will transmit the Knoxville [fol. 3850] Street Railway's power requirements from the Carolina Company to the Street Railway sub-station until June 4, 1936, after which date the Street Railway's requirements will be purchased from the Authority at its regular rates.

(3) TVA agrees to pay $6,088,636 for the electric properties of TPS. In addition TVA is paying $102,000 for the purchase of the street railway's interest in certain properties which had heretofore been jointly used and owned by the street railway and the Electric Divisions of TPS. For this sum TVA eliminates the Street Railway's interest in the Washington sub-station and Steam Plant, the General Office on Gay Street, the General Storehouse and certain other joint properties in Knoxville.

(4) TVA agrees to pay for all net capital additions made between the present time and the date when TVA

takes over the properties but TPS agrees not to make any such additions or extensions exceeding $200.00 in value without the written consent of TVA.

(5) TPS agrees that until TVA takes the properties over, TPS will make all current repairs and replacements on the property just as though no change in ownership were contemplated.

[fol. 3851] "Upon the satisfactory conclusion of the negotiations, all of the TPS transmission and distribution properties, except the transmission line between Waterville and Kingsport, will be purchased by the Tennessee Valley Authority," Mr. Lilienthal said. "For a short interim period these properties will be retained and directly operated by the TVA. During this time, the Authority will complete such engineering improvements and changes as are required to put the system into excellent operating condition and will engage in an intensive program of load development under the EHFA program of making available low cost electric appliances at the end of this interim period, the distribution properties will be turned over to the various municipal and county units in the area which will assume responsibility for distribution operations.

"Low TVA rates will immediately be put into effect upon transfer of the properties from TPS to TVA. These new rates will be the standard TVA rates plus a 10 per cent surcharge. The surcharge will be the same throughout the area. It is estimated that the system in Knox County will be completely free of debt, interest, and amortization in from ten to twelve years; the period outside of Knoxville may run from 12 to 15 years."

[fol. 3852] COMPLAINANTS' EXHIBIT No. 879 (Excluded)

TVA Press Release of August 1, 1934

An Address by John B. Blandford, Jr., Tennessee Valley Authority, Coordinator. Presented July 31, over NBC Radio Hookup as One of the "You and Your Government" Series on a New Deal in Government, under Sponsorship of the Committee on Civic Education by Radio of the National Advisory Council on Radio in Education, and the American Political Science Association

The Tennessee Valley Program

One year ago, the three directors of the Tennessee Valley Authority held their first meeting in a hotel in Washington. Today, these directors in their offices in the Tennessee Valley look back upon more than a hundred similar meetings, and the activity and accomplishment of nearly 10,000 fellow workers.

Wilson Dam is turning out TVA kilowatts. The thirty-four million dollar storage dam on the Clinch River, near Knoxville, Tennessee, has received its first batch of concrete. The more-than-a-mile-long run-of-the-river dam on the Tennessee River, twenty miles above Wilson Dam, is excavating in its second coffer-dam. Both projects—Norris and Wheeler—are now one-fourth completed. Preliminary surveys are fixing the sites and determining the dimensions [fol. 3853] of future dams.

A power policy has been formulated. The content of the "yardstick" has been defined. Wholesale and resale rates have been fixed. The nucleus of a TVA power system has been established through the purchase of transmission and distribution facilities. A transmission line to connect Wilson, Wheeler and Norris dams is under construction. One hundred miles of rural transmission lines have been pushed out into new territory. Arrangements have been made to serve more than fifty municipalities at greatly reduced rates, and private power companies have been stimulated to substantial rate reductions in other parts of the valley.

* * * * * * *

* * * In a substantial way, this program has helped in the unemployment emergency. But the Authority is

not an emergency agency, nor exclusively a construction or operating organization. Underneath this surface picture is something more fundamental. Man power is transforming steel, cement, electric wire and phosphate into dams, kilowatt hours, and fertilizer. * * *

* * * The housing of workers is an opportunity for constructive personnel programs, and a demonstration in town planning and electrification of the home. A dam is [fol. 3854] not an isolated structure or operating unit, but part of a unified development of a water system with power produced at half the cost of unorganized development and with valuable by-products in flood control and navigation. A dam is the occasion for the planning of a region and a series of dams is an integral part of the planning of a valley.

Director David E. Lilienthal is buying power systems at fair prices and building lines where they do not now exist. He is accounting for his operations with full consideration for interest, depreciation, amortization and taxes, and thereby, establishing a "yardstick" for the nation. But more than this, he is looking into the average home and seeing a very limited use of electricity, and realizing that the full benefits of electricity are enjoyed by the few. Electricity can relieve the women in 20,000,000 American homes of much of the drudgery of housework and holds much hope for the rehabilitation of the rural areas.

But rates for service have been too high. The TVA rates are removing this obstacle. In Tupelo, the first city to utilize Muscle Shoals power, rates have been reduced [fol. 3855] sixty per cent, and the average use is more than fifty per cent greater than a year ago.

Electric appliance prices have been beyond the reach of many householders. The Electrical Home and Farm Authority, an agency of the TVA, was organized to meet this problem. With the cooperation of leading electrical manufacturers, dealers and the electric utilities, this agency has made it possible for housewives to obtain through regular dealer channels electric ranges, refrigerators and water heaters at prices from 25 to 35 per cent lower than those heretofore prevailing. The increased volume of sales is resulting in a fair profit to the manufacturer and retailers and is proving a great benefit to the consumer.

COMPLAINANTS' EXHIBIT No. 879 (Excluded)

Rounding out this program is an effort to spread the knowledge of all the ways in which electricity may be used.

* * * * * * *

The Tennessee Valley Authority is a new and significant piece of governmental machinery. It has all the powers of government to enable it to do a unique job in regional planning, and it has the flexibility of a private corporation [fol. 3856] and freedom from red tape to do an efficient job of business operation. It ties together the facilities and special knowledge of Valley agencies, and the resources of all Federal departments. More than that, it ties together the experiences and aspirations of the Valley and the Nation. For in the final analysis, the program has national implications. Methods successfully worked out in the Tennessee Valley should have nation-wide application.

[fol. 3857] COMPLAINANTS' EXHIBIT No. 880 (Excluded)

TVA Press Release of August 7, 1934

The Tennessee Valley Authority announced today that it was sending David E. Lilienthal, director in charge of its electric program, and Llewellyn Evans, chief electrical engineer, to England to study the "grid" system of transmission and distribution as developed there.

They will sail on the U. S. Line Manhattan on August 15 and will be gone one month.

The trip is the result of the Authority's effort to formulate the best procedure and policy for the allocation and distribution of future large blocks of power to be available. Purchase of the Knoxville system and distribution of TVA power in East Tennessee will exhaust the capacity of Wilson Dam until completion of Norris Dam. Mr. Lilienthal has been studying the problem from the point of view of recommending a course of action and policy, but before the Board made any decision regarding the allocation of future blocks of power to municipal and other applicants, it desired to study at first hand important world projects that parallel the Authority's problems.

"The nearest analogy to the situation in the Tennessee Valley," Mr. Lilienthal said today, "is the Central Elec-

tricity Board of Great Britain, now in its seventh year. [fol. 3858] "The so-called British Grid System represents the practical, forthright English approach to a problem of seeing that electricity is widely available for domestic and industrial use. Under the British Grid System, they have a combination of publicly-owned and privately-owned enterprises with the national Government owning all transmission lines and making arrangements with public and private enterprises so as to unify the power supply and thus utilize it in the most efficient way.

"As in the Tennessee Valley, decentralization of industry is one of the principal objectives and actual results have already appeared in this direction. In its governmental status and financial operations, the Central Electricity Board is closely comparable to the TVA. The Board is an independent agency, standing on its own, with a separate budget, separate issuance of securities, and is free from usual governmental procedure."

The trip to Europe also has a direct connection with Mr. Lilienthal's position on the newly created National Power Policy Committee. Chairman Ickes of the Committee has assigned him the problems of unification of power supply and the relations between public and private electric systems. In both of those the English Board has had years of [fol. 3859] practical experience.

Conferences have been arranged for Mr. Lilienthal and Mr. Evans with Sir Andrew R. Duncan, Chairman of the Central Electricity Board, and with Sir John Snell, G. B. E., chairman of the Electricity Commission of London.

The TVA officials also will visit Ireland to study the Shannon River Hydro-Electric development. This development has made progress with respect to rural electrification in a country where electricity had been heretofore very little used among farmers.

Inspection of the Shannon district will come first; the officials then will proceed to Dublin for a conference with Dr. F. S. Rishworth, chief engineer of the development. Following that they will go to London for ten days of conferences and inspections of the British Grid.

Following his return on September 14, Mr. Lilienthal will prepare a report of his findings both for the TVA directors and for the National Power Policy Committee.

TVA Press Release of August 27, 1934

A total of 189 cities and towns, 24 counties, and 37 individual business firms have made inquiries or applications for Tennessee Valley Authority power.

Applications of the individual firms were made confidentially to the Authority and accordingly their identity is not disclosed.

The counties applying or inquiring are interested in furthering the Authority's program of intensive rural electrification.

The complete list of applicants, other than private firms, follows:

[fol. 3864] COMPLAINANTS' EXHIBIT No. 882 (Excluded)

TVA Press Release of October 1, 1934

The relation of power development in the Tennessee Valley to the St. Lawrence waterway project will be studied by trustees of the Power Authority of the State of New York in a personal visit to the Valley October 5th to 8th. This was made known by Chairman Frank P. Walsh of the New York authority in a letter to Director David E. Lilienthal of the Tennessee Valley Authority in accepting the TVA's invitation to inspect progress of the work on the Tennessee River basin project.

Fellow trustees who will accompany Chairman Walsh to the Valley are James C. Bonbright, Professor of finance at Columbia University; Fred J. Freestone, chairman of the executive committee of the National Grange; George S. Reed, New York lawyer, and Leland Olds, secretary of the board. Said Chairman Walsh in his letter to Director [fol. 3865] Lilienthal:

"The Power Authority is charged with the development of a project affecting the entire northeastern section of the country, which may be regarded as your undertaking as a part of the President's broad plan for establishing the country on a more permanent basis of national well-being and prosperity.

"Your Authority's achievements in showing the way to lower electric rates and larger domestic and rural use of electricity have already been remarkable, especially in view of the shortness of the time since you undertook the work. Your plans for establishing a more stable relationship between agriculture and industry are also noteworthy.

"The Trustees of the Power Authority feel sure that the opportunity for direct personal conference with the members of your Board and for inspection of the work which you have so well under way will prove invaluable to them in making plans for utilizing the great hydro-electric power resources of the St. Lawrence to bring lower electric rates and greater prosperity to the region the project will serve."

"The Tennessee Valley Authority board of directors and the staff executives as well *will* would derive real benefit out of such visit, during which we could exchange ideas and get your reaction to many of the problems of the TVA,"

COMPLAINANTS' EXHIBIT No. 882 (Excluded)

[fol. 3866] declared Director Lilienthal in his letter of invitation, adding; "I believe you would find the work interesting and useful to you in carrying out the great project which has been entrusted to you."

Members of the Power Authority of the State of New York have expressed a deep interest in the TVA system of rural electrification, whereby farm residents receive the same low rate that those in the cities obtain. This TVA project is working exceedingly well in northeastern Mississippi. Another subject in which the New York body evinces keen interest is decentralization of industry. The TVA has made extensive research in this field.

Results obtained by the TVA in the cost of distribution of electricity will be made available to the New York visitors. Such costs have occasioned much study in the Empire State.

Conferences will be held with the TVA board of directors and a visit made to Norris Dam. An airplane flight over the basin area to Muscle Shoals will be included in the program to permit inspection of the Wilson Dam power plant and the construction work on Wheeler Dam.

[fol. 3867] COMPLAINANTS' EXHIBIT No. 883 (Excluded)

TVA Press Release of October 2, 1934

Text of an Address Delivered Before the Technical Club of Madison, Milwaukee Engineering Club and Other Groups, at Madison, Wisconsin, Monday Evening, October 1, 1934, by Arthur E. Morgan, Chairman of the Board, Tennessee Valley Authority.

The drainage area of the Tennessee River is about four-fifths as large as Wisconsin, and has about the same density of population The Tennessee Valley Authority Act provides that the work of the Authority shall be in this drainage area and in adjoining areas in which the same issues and problems exist. So we are dealing with an area somewhat larger than Wisconsin.

The lands drained by the Tennessee River have a much greater range of physical, social and economic character-

istics than does Wisconsin. At the headwaters of the river in North Carolina and Tennessee, there are mountain valleys three thousand feet above sea level; while low water at the mouth of the river is only about three hundred feet above sea level. With more than two thousand feet of fall in its streams, and with a rainfall about double that of [fol. 3868] Wisconsin, the possibilities for water power development are very great.

* * * * * * *

In three respects the Tennessee Valley Authority law is specific and definite. The power development at Muscle Shoals, lying idle for years through the obstruction of private power companies, must be put to work. The private power companies had been using this great plant as a standby plant, letting the power run to waste when they had plenty of their own, and using it as an emergency supply when they were short. Such use of power should bring the very highest wholesale price, yet they were paying for it less than a fifth of a cent per kilowatt hour, and were retailing it at three cities within ten miles at more than thirty times as much. In this way the private power companies were receiving a subsidy of millions of dollars from the Government. No wonder they were deeply grieved and shocked at the proposal to discontinue the arrangement.

The Tennessee Valley Authority Act directed the Authority to operate this plant, to build transmission lines, and to sell the power. The Authority has adopted a comprehensive power policy. To make a fair comparison between public and private operation, it is essential that the area served [fol. 3869] shall be comparable to that of a well-proportioned private utility system. It must sell electric power in this territory or give up its entire power program, and give up any opportunity to compare the effectiveness of public and private operation.

The Authority has determined, if possible, to buy existing facilities at fair prices, and though hundreds of communities have asked for its service, and a considerable number have voted to buy power from the Authority, yet not a single competitive line has been built. Negotiations with

private companies have been entered into in good faith, and contracts have been made for the purchase of transmission and distribution facilities. In case of the purchase of the Knoxville power system, some very unfair and misleading criticism has been leveled at the Authority. The critics have not told the public that the utility company involved, at one stroke of the pen, increased its capitalization from $12,000,000 to $17,000,000 without adding one cent to its actual properties. Neither did these critics disclose the fact that the utility company had been using high power rates to pay eight per cent dividends on an almost obsolete street car system which was not even paying its operating expenses. Over half the capitalization of the company was made up of water and of a non-pro- [fol. 3870] ductive street car system. The price offered by the Tennessee Valley Authority and accepted by the company is full payment of all the actual useful investment.

The Authority holds that power use would greatly increase if rates were lower. The community which has been served longest by the Tennessee Valley Authority is Tupelo, Mississippi. The Authority is selling power at wholesale to this city at about half the former rates. The city, in turn, is retailing the power at about half the old rates. Domestic consumers now pay three cents for the first fifty kilowatt hours, two cents for the next hundred kilowatt hours, one cent for the next two hundred, and four-tenths of a cent for everything thereafter. Under these new rates, the use of power has doubled in less than a year, and is still increasing. The city is meeting all charges for operation, maintenance, depreciation, repayment of capital and taxes, and is building up a substantial reserve. The Authority holds that there is no over-production of electric power, but rather a great under consumption, which can be overcome by lower rates and by lower prices on electrical equipment. The Authority is undertaking to conduct its power business as a self-sustaining project which will [fol. 3871] amortize its capital and pay its full share of taxes.

To promote the wider use of electric equipment the Authority organized the Electric Home and Farm Authority in order to make available low priced electric appliances. When manufacturers will reduce the price of appliances

and power companies will reduce the price of power, the Electric Home and Farm Authority will help finance sales. Under this program the price of appliances is being greatly reduced, and the sales greatly stimulated. These appliances are handled through the regular retail outlets.

Not all interests approve the electric program of the Authority. The coal interests and the ice interests have united in legal suits in Federal and State courts in an effort to block the program. The coal men fear water power will infringe on the use of coal, and the ice men fear the increase of electric refrigeration.

The electric power program is being directed by Mr. Lilienthal, formerly of the Wisconsin Utilities Commission.

A second specific provision of the Tennessee Valley Authority Act provides for the construction of additional dams and for the increase of power resources. Two great [fol. 3872] dams are now under construction—Norris Dam on Clinch River and Wheeler Dam on the Tennessee River. * * *

Below the Norris Dam there will be about ten dams on the main Tennessee River. The Tennessee varies greatly in flow between dry summers and wet winters, and the Norris Dam will so regulate the flow as to more than double the prime power at each of these dams.

By developing the water power of the Tennessee River as a single great coordinated system, storing water in a series of headwater dams during the rainy season and releasing it to the dams down below during the dry season, power can be developed at far less expense than by independent projects, and at the same time the interests of flood control and navigation can be promoted. Only the Government can properly carry on so far-flung an undertaking.

Private companies are saying that water power cannot compete with coal and that there is a great over-production of power; yet at this moment well financed private interests are spending substantial sums for new water power plants in this area, in an effort to circumvent the TVA and to keep the power possibilities for themselves. Their actions speak louder than words. It falls to my lot to have charge of the development of this power, navigation, and flood control development.

[fol. 3873] COMPLAINANTS' EXHIBIT No. 884 (Excluded)

TVA Press Release of October 6, 1934

Statement Filed by the Tennessee Valley Authority With the Alabama Public Service Commission

Knoxville, Tennessee, October 6, 1934.

Alabama Public Service Commission, Montgomery, Alabama.

GENTLEMEN:

In re Alabama Power Company, Petitioner, Docket 6636

The Authority has given most careful consideration to its position in the above entitled matter, and herewith informally submits its views to your commission.

Let us first summarize the facts, and state the issue.

The Alabama Power Company, a privately owned corporation operating for profit, has contracted to sell to the Tennessee Valley Authority, a governmental agency of the [fol. 3874] people of the United States, two groups of properties. The price in each case was reached after extended negotiation. Your Commission has already determined that the sale of the first group, which included transmission and distribution properties, is consistent with the public interest. This determination was made upon the facts submitted to you by the petitioning Alabama Power Company, and a brief statement by counsel for TVA. While the order of approval, based upon the finding of public interest, has been remanded by the Circuit Court, the Court's decision simply held that the notice was inadequate, and did not raise the issue which we are here discussing.

The question as to the second group of properties is the same as in the first; namely, whether it is consistent with the public interest that the Alabama Power Company sell certain of its properties. The two petitions are identical in principle; the distribution properties involved in the second petition are served from the transmission lines involved in the first, and all of these properties make but a single operating unit. In deciding the question of public interest on the first petition the Commission virtually considered all of these properties as a unit, although the order of approval was, of course, limited to the properties described in the peti-

[fol. 3875] tion. Notwithstanding the substantial identity of the two petitions, in the second case, Docket 6-36, your Commission, in a series of communications to the Tennessee Valley Authority, and, as we are advised, in statements made in the record of the proceeding, has taken the position that it cannot determine whether the sale to the Tennessee Valley Authority is consistent with the public interest upon the same kind of showing as was made by the Power Company petitioner in the case of the first group of properties. It appears that your Commission has concluded that a showing by the Alabama Power Company with respect to this sale is inadequate as a basis for a finding by your Commission, although we are advised that the Commission has not yet heard the Power Company's testimony, and therefore presumably does not know the scope and nature of that testimony.

In the second group of properties, as distinguished from the first, the Tennessee Valley Authority, at the insistence of your Commission, has filed an elaborate statement of facts, in response to a questionnaire by the Commission's Chief Engineer. Your position is that neither a showing [fol. 3876] by the Alabama Power Company (which was regarded as adequate in the first group of properties) nor the elaborate statement of facts informally filed with you by the Authority is deemed adequate by your Commission to enable it to determine whether the public interest will permit an agency of the United States government to operate in the State of Alabama. In your communication of September 21 you state, among other things, that it will be necessary that there appear before your Commission as witnesses some seven executives, officers and staff members of TVA to testify regarding the proposed sale of property. You state further that you desire the submission to you of the "final report" upon which the rates to be charged by the transferred properties were based, the supporting data pertaining to said report, and the individuals who were responsible for the report and the supporting data.

Your Commission would obviously not require testimony concerning the basis of Tennessee Valley Authority's rates if it did not consider that your Commission has jurisdiction

to disapprove this sale because in your opinion these rates are not proper rates.

[fol. 3877] Your Commission would certainly not demand testimony unless it felt that that testimony was pertinent to a discharge of its duties. If your Commission did not consider that it had jurisdiction to refuse to permit TVA rates to be charged in the State of Alabama, it would surely not call for evidence respecting the basis of those rates.

Calling for this testimony would give the intervening petitioners (and their allies) a further opportunity to stir up ill will in other sections against the South and against the Authority's program, to permit them to use the Commission's hearing room as a sounding board for propaganda against the President's program in Alabama, or to permit a "fishing expedition" which might assist the intervenors in the litigation now pending in several courts. The Authority believes that the Alabama Public Service Commission would not lend itself to such subversion of its functions. The Authority believes that the Commission's reason for calling for this testimony is its conviction that, having this testimony, it has jurisdiction to impose its views as to rates upon an agency of the United States: and this presents a fundamental issue of far-reaching implications which must be faced.

[fol. 3878] In a recent decision your Commission held that the Tennessee Valley Authority, as to its operations within the State of Alabama, is in a position of any public utility operated for profit, and therefore subject to comprehensive regulation by your body. The assumption that your Commission has jurisdiction to hold that the rates to be charged by the Tennessee Valley Authority are too low, and that therefore you may effectively bar the Tennessee Valley Authority from operations within the State of Alabama, is an inextricable part of your conclusion that the TVA is a public utility subject to regulation by your Commission. With all respect, the Tennessee Valley Authority disagrees with this conclusion, not merely as a matter of law, but as a matter of the basic policies of the program of the President and the Congress.

And since your Commission cannot directly determine the rates and rate policies of this national agency, it should not

try to do this indirectly, by calling for testimony concerning matters clearly beyond your control. To illustrate why Tennessee Valley Authority objects to the line of inquiry you propose to follow if our witnesses appear, let us take [fol. 3879] a few concrete situations. Let us suppose that the Commission, after reviewing the evidence which it has called for from the Authority, should decide that the Authority's rates were too high or too low, and should approve the sale on condition that the Authority increase or reduce these rates. Or suppose that the Commission should similarly hold that TVA rates for farm use should not be substantially as low as in towns, despite the mandate of Congress expressed in the Tennessee Valley Authority Act concerning rural electrification and agricultural development. The policies as to rates which govern the Tennessee Valley Authority are those derived from the Act of Congress. For the directors of the Authority to permit these policies to be changed or effected by the orders of your Commission would be a violation of our oath of office. In matters of rates, as in all other matters, the Authority cannot have two sources of authority.

Or suppose that your Commission, after a study of the Authority's books, records and accounting methods, which are covered in your letter of September 21, should come to the conclusion that our books and records were not kept in accordance with the Commission's standards and that, for [fol. 3880] purposes of uniformity or otherwise, it should condition its order of approval on our adoption of the Commission's standard accounting classifications. The Tennessee Valley Authority Act specifically provides that the Comptroller General of the United States shall audit our books and records and report to Congress. The Authority would here again be faced with a conflict of authority between your Commission and the Congress of the United States.

In view of your extended opinion of July 14, holding that the Authority is a mere public utility and as such subject to your control in every particular, there is considerable reason for believing that we must give serious consideration to the possibility that through this very proceeding, involving merely the transfer and sale of property, you will

seek, by the attachment of conditions, to exercise jurisdiction over all the Authority's operation in Alabama. Your action in calling our rate policies into question certainly gives support to this belief.

The Tennessee Valley Authority is at this moment and has for some weeks been ready to the last detail to take over and operate the properties now owned by the Alabama [fol. 3881] Power Company involved in these proceedings. Its Board of Directors has appropriated approximately one million dollars to be expended immediately in the rehabilitation and extension of these properties. The Authority has set aside substantial sums for the construction of a network of lines to farms not now served. The Authority has a considerable staff of technical experts at work on plans designed to stimulate industrial development throughout Alabama. A new construction project which will put thousands of men at work in Alabama within a few weeks, and which will continue for several years is ready for final approval of this Board. The Authority has plans well under way, and has expended substantial sums, looking toward small-scale industry in conjunction with agriculture within the State of Alabama. Certain communities in Alabama have officially expressed their desires with respect to this program, and have approved the TVA plans. The people in the affected area are cooperating, through their own agencies, in this program in a spirit which is most heartening. A delay of even a few weeks in moving forward with this program at this critical time in the history of the South we feel would be most unfortunate. But the Tennessee Valley [fol. 3882] Authority can not begin this complete program in the State of Alabama if it must do so at the sacrifice of a fundamental principle, the principle that this is a national project; that it is subject only to a single authority; the will of the people of the entire country.

The Authority has already submitted to you a statement giving in considerable detail particulars on the following matters, among others:

1. The Authority's wholesale and resale rates;

2. The Authority's form of power contract with municipalities;

3. The Authority's rules and regulations;

4. The Authority's plans for the ultimate disposition of the properties;

5. The Authority's plans for rehabilitation of the existing facilities;

6. The Authority's plans for the construction of additional rural extensions;

7. A comparison of existing rates with the rates which will be charged by the Authority upon approval of the petition.

8. An allocation of the purchase price among the various distribution systems.

You have asked, in your letter of September 29, "if the [fol. 3883] Authority may be expected by the Commission to aid in the hearing" of these causes, "and if so, to what extent you propose to aid in the hearing of these causes. • • •" The following specific suggestions are offered for your consideration, and we believe indicate a method whereby both your responsibility and our responsibility may be satisfied:

1. Under an agreement that jurisdiction will not be conferred thereby, the Authority will have present at the scheduled hearings, the witnesses requested by you, or any others you may designate.

2. The appropriate witnesses will, if the Commission desires, verify the extended information contained in the statement filed by the Authority the contents of which are listed above, and will testify, if the Commission so desires, on the technical and financial resources of the Authority.

3. The Authority will have counsel present who will seek to aid the Commission with respect to legal questions involved in the petition.

4. This participation would be conditioned upon the understanding that all matters pertaining to rates and rate policies, and accounting are for the sole determination of [fol. 3884] Congress and its agents, and, therefore, not a

proper subject for examination or cross-examination in these proceedings. It is a matter of public record, which can be filed with you, that these same rates and rate policies have successfully worked out in practice under closely comparable conditions in a substantial area in Northeast Mississippi and in the City of Athens, Alabama.

We suggest that the foregoing plan provides a means whereby your Commission can secure the fullest information, and yet not involve the proceedings in matters over which your Commission has no direct Jurisdiction, and should not seek to exercise indirect control.

We have sought to approach this matter throughout in a spirit of cooperation, in an effort to find some reasonable means whereby your wishes can be complied with which at the same time will permit us to meet our responsibilities as we see them.

We await your views on this matter in the hope that the foregoing suggestions will be acceptable to you and will permit these proceedings to be concluded at an early date.

[fol. 3885] Very truly yours, Tennessee Valley Authority, —— ——, Chairman; —— ——, Director; —— ——, Director.

[fol. 3886] COMPLAINANTS' EXHIBIT No. 885 (Excluded)

TVA Press Release of October 8, 1934

Muscle Shoals power was supplied to a system of approximately seventy miles of rural electrification lines in Lauderdale County, Ala., yesterday when Fred J. Freestone, trustee of the Power Authority of the State of New York, and a prominent farmer in central New York, threw the switch at a rural substation about two miles northeast of the Wilson Dam, which connects this system with the generators at the Wilson Dam power plant.

This system comprises a rural electrification project, which is wholly owned by the Tennessee Valley Authority and which serves a territory which never before has been supplied with electric power. Along the lines are ap-

COMPLAINANTS' EXHIBIT No. 885 (Excluded)

proximately 300 farms and 100 residences in small communities, which have indicated that they wish to receive service from these lines.

Included in the territory are the towns of Waterloo, St. Florian, Oakland, Wright, Gravelly Springs, Center High and Green Hill. One line extends out some distance along the Florence-Savannah Road.

The opening of these lines for service is in accord with the plan outlined last July by David E. Lilienthal, director of the Tennessee Valley Authority in charge of power [fol. 3887] development, for the electrification of north Alabama. Under that plan the systems which would be taken over from the Alabama Power Co., and the new lines and extensions which the Tennessee Valley Authority would construct, would be operated by the Tennessee Valley Authority until such times as the municipalities concerned could take them over. Meanwhile, in addition to the regular TVA resale rates for power, customers would pay a surcharge of ten per cent, which in turn would be applied against the cost of the systems to the municipalities.

The energizing of this rural system was a feature of the visit of the Chairman and Trustees of the New York Power Authority to the Tennessee Valley Authority's projects at Muscle Shoals. • • •

The members of the New York Power Authority are touring the Tennessee Valley with the view of studying the TVA's policies and achievements in bringing about lower electric rates and larger domestic and rural use of electricity; the effect of public distribution within cities and villages upon the cost of electricity to small consumers in the surrounding rural areas; extension of rural distribution lines; decentralization of industry; and agricultural problems and the realation of public electricity to those problems.

[fol. 3888] COMPLAINANTS' EXHIBIT No. 886 (Excluded)

TVA Press Release of October 9, 1934

Statement by David E. Lilienthal, Director of The Tennessee Valley Authority in Charge of Power, Upon the Conclusion of Visit to Tennessee Valley of the Trustees of the New York Power Authority

I was particularly struck in talking with Chairman Walsh and his fellow Trustees these past few days, by the similarity of the problems and of the point of view of these two Authorities in their job of developing abundant electricity and distributing it at the lowest possible rates. For one thing, we seemed agreed that electricity, if people are permitted to use it as liberally as they should and can, will largely influence the economic and social life of the country in the coming decade. Then too, as trustees of public property of great value, our New York colleagues and ourselves are both under a duty to consider ahead of any other consideration the good of the entire community in the development of great natural resources. In the St. Lawrence "yardstick" area and in the Tennessee Valley "Yardstick" area, we are both working toward the same end; To find economic ways and means for an ever wider use of electricity in homes, on farms and in industry.

TVA Press Release of October 22, 1934

An Address Delivered Before a Joint Meeting of the National Conference on City Planning and American Civic Association, October 22, 1934 at St. Louis, Mo.

"Large Scale Regional Development" by E. S. Draper, Director of Land Planning and Housing, Tennessee Valley Authority

In the planning of a large region, which is the subject of this discussion and one which means the cutting across political lines, county and state, there is bound to be a lack of political implementation using the term in its right sense, on account of the fact that the American political

system has constitutionally given the rights of administration in a large measure to the agencies of town, city, county and state. • • •

I would question whether any such regional agency could be successful, unless its set-up was such that an integral part of its activities were intimately and actively associated with the social and economic development of the region. • • •

[fol. 3890] I believe the most successful method is the basis on which the Tennessee Valley Authority has been set up, whereby the whole program grows out of the development of natural resources for which it has the funds and the authority and is able to cut through state lines in proceeding with such developments.

The planning of a large region cutting across state lines in seven states in the geographic region of the Tennessee River watershed involves more than the 42,000 square miles within the Valley. Fortunately the Act gives the right to plan beyond the geographic boundaries in such instances as the welfare of the region itself is affected.

In connection with power, I interpret that to mean that wherever power can be transmitted from generating plants along the Tennessee River or its tributaries and the distance to which that power can be effectively transmitted, therein lies the area or region within the influence of our planning activity. It would certainly seem short sighted to send power from Muscle Shoals to Birmingham, Alabama, from Pickwick Dam to Little Rock, Arkansas, from Aurora Dam to St. Louis or Terre Haute, or from Norris Dam to [fol. 3891] Asheville or Cincinnati, without giving consideration to the relationship of such power transmission to the country transversed by the lines and the effects in the way of industrial activity, population changes and transportation and communication adjustments.

So, any regional program must contemplate effects outside of the region itself as a part of its planning procedure. I would question the chances for success of TVA if it did not have as a part of its program the development of great dams and reservoirs for flood control, navigation and electric power. It is hard to imagine a more compelling relationship to the lives and activity of the people than that which may result from providing greatly increased electric

power, the use of which will change and alter the daily habits of millions of people. * * *

In the TVA we have an agency in which planning goes hand in hand with the basic development or extraction of natural resources. During the seventeen months that I have been connected with this undertaking I have had a gradually increasing respect for the power which planning [fol. 3892] may be able to exert in such a situation and the opportunity which exists for implementation.

I believe that there is a definite place in American planning for nonpartisan governmental agencies concerned with the planning of large regions and cutting through state lines. I feel that the planning work of such agencies should be related to a basic governmental program, and, if so related, the planning results from the work of such an agency can be made more effective and more beneficial than planning that is not so much implemented for its execution.

In England the effect of power transmission through the so-called grid system, whereby the distribution lines are under the control of the government whether the power generating plants are private or public, has brought the planners to the realization that this is perhaps the most important development necessitating regional rather than local planning that has ever come about in this country. The question uppermost in the minds of English planners today seems to be: How can we tie together the work of many local [fol. 3893] planning agencies so that the regions which have been established for power distribution can be made truly effective from a planning standpoint, if power is to be the motivating force of a new area of civilization, as many thoughtful men predict? Then it should and must be guided by the best planning thought, cutting across State lines and relating to great regions.

To achieve the ultimate of the TVA Act, we must seek not solely the production of cheap power, or low cost fertilizer or any of the other desirable results of our varied program, but through wise Planning to ensure these instruments of a better regional economy reaching into the lives of all the people in such a way as to benefit all who live in the region and those outside within the scope of influence.

[fol. 3894] COMPLAINANTS' EXHIBIT No. 888 (Excluded)

TVA Press Release of November 7, 1934

Norris Dam, the Tennessee Valley Authority's first major project in its Valley program, is one year old today. * * *

A Power policy has been formulated and the power "yardstick" defined. Wholesale and resale rates have been fixed, and arrangements have been made to serve more than 50 municipalities at greatly reduced rates. The nucleus of a TVA power system has been established through the purchase of transmission and distribution facilities. More than a hundred miles of rural transmission lines have already been pushed out into territory hitherto not served with electric power. Wilson Dam itself is turning out TVA kilowatts at rates that take electricity out of the luxury class of commodity. It is estimated that great savings will be made annually by consumers served by other power utilities in the Valley states through substantial rate reductions. Further, the Electric Home and Farm Authority has been set up by the TVA as an agency that is making it possible for housewives to obtain through regular dealer channels electric ranges, refrigerators, and water heaters [fol. 3895] at prices from 25 to 35 per cent lower than those heretofore prevailing. The EHFA is cooperating with manufacturers and utilities to encourage the wider use of electricity in homes and on farms.

And the work of the Tennessee Valley Authority has really just started.

[fol. 3896] COMPLAINANTS' EXHIBIT No. 889 (Excluded)

TVA Press Release of October 26, 1934

Attacks by the coal industry on the Tennessee Valley development and other Federal hydro-electric projects were yesterday met with a proposal by the Tennessee Valley Authority that the industry and the TVA mutually arrange an unbiased investigation of the respective costs of water power and coal energy.

In a personal appearance before the Bituminous Coal Research Division of the National Coal Association, in con-

vention at Washington, TVA Chairman Arthur E. Morgan reiterated the Authority's desire to cooperate with the industry in developing new uses for coal, including a smokeless fuel, adding:

"The coal industry has seen fit to oppose the plans of the Tennessee Valley Authority on several counts. First, that electric power generated by water power will use less labor than power generated by steam through the use of coal. The coal industry and the electric power industry can not claim that inefficient methods should continue in order to provide labor. The coal industry has done its utmost to improve mining methods by the introduction of labor-saving machinery. As a result, many thousands of coal miners have been thrown out of work. This policy of eliminating [fol. 3897] labor as far as possible is a settled policy of the coal industry within itself, and the coal industry can not object if the general public adopts the policy of the most economical and efficient methods of meeting its power needs.

"Moreover, during the present period of unemployment, the building of Norris Dam and Wheeler Dam is giving employment to nearly 10,000 men, and until these dams are completed they are actually increasing the demand for coal. Moreover, low-priced power will so stimulate the manufacture of electrical appliances in all parts of America, and will so increase the use of electric power that employment will be substantially increased in the total, even in coal mining areas, with benefits far more widely distributed. The Tennessee Valley Authority has vigorously pursued the policy of endeavoring to stimulate self-sustaining employment in this region, and to insure that the total result of its activities shall be fewer unemployed persons and fewer persons dependent on Government appropriations.

"The National Coal Association also claims that electricity developed from coal is cheaper than electricity developed from water power. We have two comments to make on this [fol. 3898] claim. First, the private utility companies have no predilection for either coal or water power; yet their development has been very largely in water power, and today practically all the power being used in the Tennessee Valley area is water power. Practically all steam plants are idle.

COMPLAINANTS' EXHIBIT No. 889 (Excluded)

"The Tennessee Valley Authority would propose to the Coal industry that instead of a campaign of denunciation, the Tennessee Valley Authority and the coal industry unite in selecting a body of competent, disinterested investigators to make an impartial investigation covering the following points:

"1. The cost of electric power generated by the Wilson, Norris and Wheeler dams, with such standby steam plants or such additional water storage as may be economical. In this estimate, the war-time development at Muscle Shoals would be appraised at a fair present value and not at the total investment made under war-time conditions for military purposes.

"2. The actual cost of coal as mined within reasonable transmission distance of these dams, including indirect tax subsidies, if any, to the coal industry in the form of relief of underpaid or destitute mine workers and other forms of subsidy. This investigation should include the [fol. 3899] total actual cost of coal, including its social costs, due to anti-social working and living conditions, if any, within coal mining communities, and what the total cost would be if the coal miners were self-sustaining.

"3. The extent to which steam plants are paying less than the market prices for coal by means of buying "distressed" coal.

"4. The actual cost at present of generating power in the actual steam plants within transmission distance of the three dams mentioned; also what the cost would be of abandoning the present steam plants: paying off capitalization, and building new and modern steam plants in accordance with the best modern practice.

"5. The cost of meeting additional requirements for power in this region by the construction of additional steam plants of modern design; and the comparison of this cost with the cost of hydro-electric power generated at the three dams mentioned."

Chairman Morgan declared that the TVA has carried on research for more than a year in an endeavor to pro-

COMPLAINANTS' EXHIBIT No. 889 (Excluded)

mote the welfare of the coal industry as part of the Tennessee Valley Authority program.

[fol. 3900] COMPLAINANTS' EXHIBIT No. 890 (Excluded)

TVA Press Release of November 19, 1934

The TVA Directors today concluded an arrangement with the Southern Industries and Utilities Company, for the evaluation of this company's property on the lower Tennessee near what is known as the Aurora Landing dam site. The valuation is to be made by the Federal Power Commission, before whom the Southern Industries and Utilities Company has pending an application for license to construct a power dam and which has heretofore been granted a preliminary permit. TVA will acquire the company's property on the basis of this valuation, which is to represent actual legitimate costs as determinable under the Federal Water Power Act.

Carl A. Bock, Assistant Chief Engineer, says TVA has since its organization steadily been pushing investigations on the lower Tennessee toward the development of a suitable project which will provide the greatest economic value to the Valley, and these plans are more comprehensive and more advanced than the plans heretofore made by any other agency.

[fol. 3901] On account of the very large problems, the large cost, and the important considerations involved in the treatment of the lower river, plans must be worked out with unusual care in order to avoid large waste through hasty or ill-considered construction. Surveys and investigations are progressing as rapidly as possible, but it will require some time to develop final plans.

Some years ago Southern Industries and Utilities Company, a Maryland Corporation, procured a preliminary permit from the Federal Power Commission to engage in work preliminary to the construction of a dam. Two months after the creation of the TVA the company applied to the Commission for a license. The Authority entered a protest to the granting of this license, taking the position that the proposal interfered with the unified development

of the river for the best public interest. The company relied for the major portion of its financing on an appropriation from the Federal Congress, on account of the Government's interest in navigation. This appropriation had not been secured and the whole proposal was left in an indefinite state.

In the meantime the publicity given to the company's proposal had caused the general public impression that [fol. 3902] final plans and appropriations had been completed and that construction could start at once. This is not the case, and the present action of the TVA Board is intended to clarify the status of the project in the public mind, as well as to permit the Federal Power Commission to dispose of the application for license which is still pending before it. TVA recognizes only the right of the company to compensation for property, but does not recognize any promotional costs or so-called water rights in the situation. The pending application of the company for a license created a special situation which needed clarification.

[fol. 3903] COMPLAINANTS' EXHIBIT No. 891 (Excluded)

TVA Press Release of December 17, 1934

Address Delivered by Dr. Arthur E. Morgan at the Wharton School, University of Pennsylvania, Philadelphia, on December 17, 1934

* * * * * * *

Certain other phases of the program are in full glare of publicity and of controversy, notably the issue of electric power. The TVA inherited this issue with Muscle Shoals, but it is not an unwelcome inheritance. In the new adjustment of agriculture and industry which must be a feature of wholesome economy in this region, and in a higher level of domestic economy, abundant and cheap electric power will be a most potent factor.

We believe that when the TVA was organized and its power policy was established, the prevailing rates for domestic power were about twice as high as were necessary

to meet all proper charges on necessary and reasonable investment. The power companies of the region headed up in a few great holding companies in New York. In recent years, electric power has been one of the richest sources of corporate income, and the powers that be are loath to see this domain infringed upon. The TVA holds that the advantages of electric power, beyond proper cost of fi- [fol. 3904] nancing and operation, should accrue to the people of the region where the power is generated and used. For a generation our railroads were stakes in a game played by high finance, rather than primarily a service to the people. Electric power should not repeat that history. With the coming of the TVA and of the present national administration and certain new state administrations, the power companies have made sudden and great reductions in rates. The following sentence is quoted from a recent advertisement of the Georgia Power Company:

"Minimum bill customers will continue to pay $1.00 a month. But the dollar now will buy 15 kilowatt hours, instead of 5 as was the case under the old rates. That's a reduction in price of electricity to such customers from 20 cents to approximately 6½ cents a kilowatt hour." Those are the words of the company. They describe an extreme case. For the average household the cut in residential rates was about 35 per cent. In the opinion of the TVA these rates are still too high, and are still placing the Tennessee Valley under unnecessary tribute.

But there is another reason why the public should be [fol. 3905] interested in the generation and distribution of surplus electric power. The Tennessee is a great river system, draining more than 40,000 square miles. It has great power possibilities, which can be developed along with flood control and navigation. If power developments on the Tennessee are by unrelated projects there will be great loss of economy and efficiency. Power plants on the main river have great capacity during high water, but lack storage possibilities for regulating the river. On the up-river branches there is great storage capacity. By uniting this entire river system into a single integrated system, to provide navigation flood control and power, electric power can be produced far more cheaply. This is planning

COMPLAINANTS' EXHIBIT No. 891 (Excluded)

and integration on a far greater scale than has heretofore been accomplished. Treated as a unit, the four great dams built or under construction by the TVA can bring about a far higher quality of navigation, and can produce power at a much lower cost than the most modern steam plant. Moreover, all the processes of construction and operation of the TVA water power system are with well-paid labor under modern wholesome working conditions, in striking [fol. 3906] contrast to conditions in much of the coal industry. It would seem a pity for the country to suffer the essential social loss which would come from unintegrated, haphazard development. * * *

Briefly, the power policy of the TVA is as follows:

The business of supplying power is not a private business, but concerns the public interest. It cannot be carried on effectively except by the exercise of governmental functions, such as the right to take private property for public use, and the right to maintain monopolies. The public may exercise these rights directly through the government, or may grant them to semi-private agencies. It is for the people to decide which course shall be taken.

Congress has established the policy of public generation and sale of surplus power in the Tennessee Valley region. Unless this act should be found unconstitutional, it constitutes a formulation of public policy. The TVA is authorized to acquire existing properties or to construct competing facilities. Many cities in the region have formally requested the TVA to supply them with power. To date, [fol. 3907] not a single mile of competing line has been built, though it may become necessary to do so if a policy of continual obstruction is continued. It has been the policy of the TVA to buy existing properties at a fair price rather than to build competing properties. It has offered to pay the fair actual value of such properties but has refused to pay for inflated capitalization. Where capital inflation has been extreme, there may be a marked difference between what the TVA will offer, and the total capitilization. It is the policy of the TVA, in calculating the cost of power, to include every legitimate cost including operation, depreciation interest, taxes, and amortization. Taxes are estimated to equal those paid by the private utilities. It is interesting to note that most private utilities do not

COMPLAINANTS' EXHIBIT No. 891 (Excluded)

provide for amortization. The program of legal entanglements being thrown about the power program of the TVA—There were several actions pending when I received the last returns—may serve to delay effective action and for a time support the claim that the government cannot be effective in business. The loss caused to the TVA and to the public by these obstructive actions may run into millions of dollars.

[fol. 3908] It is the aim of the Tennessee Valley Authority to develop the water resources of the Tennessee River system by a single coordinated system, and to sell its surplus electricity to municipalities and other users at rates that would pay all legitimate costs, including taxes. We believe that there is no over-production of power, and that lower rates will lead to such great increases that new facilities will very soon be necessary. Where TVA rates have been in effect, the use of power has doubled in less than a year.

[fol. 3909] COMPLAINANTS' EXHIBIT No. 892 (Excluded)

TVA Press Release of November 5, 1934

Address in Philadelphia, Pa., Given by Dr. Arthur E. Morgan, Before the Democratic Womens Luncheon Club, November 5, 1934

That was largely the burden of the President's mind in establishing the Tennessee Valley Authority. In the minds of Congress, another thought was dominant. During the World War, a great power plant was built on the Tennessee River at Muscle Shoals, the Wilson Dam and power plant. Twice, Congress had passed bills providing for government ownership and operation of that power plant. Twice such bills had been vetoed, by Coolidge and by Hoover. The temper of the American people was fairly well made up on that point.

In his campaign speeches, President Roosevelt expressed himself this way. He said he did not approve the taking over of the power resources of America by the government. He said he did approve, however, of a limited number of

projects which he called yardsticks of government owner-
[fol. 3910] ship and operation, where it might be possible to make a fair comparison of government ownership and operation and of private ownership and operation.

The Tennessee River is an excellent case, for two or three reasons. First, the government already owned a great power plant there. Then there is another reason that is even more compelling. The Tennessee River has a drainage area of 42,000 square miles, just about the size of the State of Ohio. If the power on that river is developed independently a project here and a project there, probably a third of its potentialities would be lost.

Let me illustrate. The Wilson Dam at Muscle Shoals has only a relatively small capacity for prime power, as they call it, that is, dependable power the year round, because the river varies greatly in its flow. A year ago last summer, during a dry season, there was only water enough in the river to produce 25,000 kilowatts of energy. A year or two before, in the winter time, there was water enough to produce 600,000 kilowatts of energy, a range of about twenty-five to one. On the other hand, up on one of the branch streams we are building the Norris Dam and reservoir, a reservoir larger than any now existing in the United
[fol. 3911] States, big enough to hold the entire flow of the river above for a year at a time. The Norris Dam, taken by itself, might not be profitable, because if you spread that flow throughout the whole year, the energy might not be worth the cost. But suppose you take the Norris Dam and the Wilson Dam at Muscle Shoals together, what do you get? For about eight or nine months in the year, there is an abundant flow in the Tennessee River, and then for two or three months there is a low flow. Now, if you use the up river power plant to store water when there is abundance below, and to let it out during the one or two or three months when there is low water below, you can bring up the flow in the lower river so that instead of having 25,000 kilowatts capacity, it will have 150,000 kilowatts capacity. You can fill up those low periods, and you can make the Wilson Dam worth very much more than it would be worth alone. So that neither of these projects is fully valuable by itself, but taken together, they produce some of the cheapest hydro-electric power in America.

Those are just two cases. Below Norris Dam there are places for about eight or ten power plants along the Tennessee River. There is very little storage at any of those. [fol. 3912] By building the Norris Dam up river, you can more than double the value of each of the eight or ten down river. By building additional dams up river, you can further increase the value of every one down river. Taken independently, those power plants are of doubtful merit. Taken together, they produce one of the most economical power developments on the American continent.

Now, there is a place where the facts of the case indicate the need of social and economic planning. • • •

This principle of a yardstick of a comparison, has been established by Congress. If we are to have a case of public ownership and operation, it must be somewhere, it can't be up in the air. Now, while those who are interested in preventing the government from having such a case, were preventing the use of Wilson Dam at Muscle Shoals, they were surrounding that area with their private transmission lines. They were putting in their investments in that area, and they were selling securities to widows and orphans in that region. I recently saw about one hundred and fifty letters that had been written to the President, protesting against the government development of this power, and it happened that a large part of those were from widows and [fol. 3913] orphans. Whether there was an effort to sell them for publicity purposes, I don't know, but perhaps a car- catalogue is kept of widow and orphan investors which can be used at the right moment.

Now, if we are going to have a case of public ownership, it must be somewhere; we must take an area. That area must be on a large enough scale to be comparable with other power developments. It can't be a little corner that is too small to be efficient. A natural unit of production is the Tennessee River watershed. Nature has made that a unit. The natural unit of consumption is an area that would use that power.

The policy of the Tennessee Valley Authority is this: to develop power as cheaply as it can be actually developed, paying good wages and meeting all actual costs, and to purchase from the private companies an area large enough to

distribute that power. The law provides that we can build competing lines against private companies. • • •

We believe the power companies are in their own light in keeping their rates so high that the public can not make use of power. So we have set a price for power which we believe will pay all the proper costs—taxes, amortization, inter-
[fol. 3914] est—all proper costs, but no more.

Now we have taken over a few towns. There is a campaign put on by those who try to prevent us from establishing a yardstick, that is obstructing the program. I believe it would be a fairer deal if they would cooperate with us and say, "You take that property, buy it from us at a fair price, and see which is better." It seems to me that if the private utilities are so certain that they are more competent, more efficient, they would welcome a chance to have a comparison. So we have invited them to cooperate with us. We would like to have them be acquainted with our books and our records in every way to see just how it turns out when you have this comparison.

At Tupelo, Mississippi, we have been furnishing power for about eight or nine months at about half the rate charged before. During that time, the use of power in that town has more than doubled. Those people are buying electric appliances. In those eight or nine months, they have bought more appliances than they had bought in all the history of the town before. Other towns are following, and the factory towns of the North are prospering by making the equipment that is being sold.

I believe that the power policy of the Tennessee Valley
[fol. 3915] Authority is a sound policy, that it will reflect to the advantage of the private utilities and of the public utilities. One of the large private utilities that we are competing with has lowered its rates, not as much as ours, but about 30%. The increase of power sold has been so great that its income was greater than it was before it lowered rates. • • •

At the same time, we have been developing an electric utility system. Just as there is difference in State administrations, some good and some bad. In utility administration there has been a watering of stock, there has been a corrupting of legislators, there has been a corrupting of public utility administrators. Sometimes the lid blows

COMPLAINANTS' EXHIBIT No. 892 (Excluded)

off as it did in the Insull case. I doubt whether the Insull system was the only great national system run in an unsound manner. * * *

We have been buying certain utility properties in the Tennessee Valley. A great deal has been said about our purchase of the Knoxville system. There are certain things that are not advertised to the public. For instance, at a time when the Tennessee Public Service Company, owning the Knoxville system, had a capitalization of $12,000,000, its [fol. 3916] directors sat down one day and wrote $4,500,000 of water into that capitalization, added approximately 30% to its capitalization over night, without adding one cent to its valuation. We are refusing to buy that water in buying that property.

Again, that company owns a street car system in Knoxville. Those of you who know public utilities know that a street car system in a town of 100,000 isn't always worth a great deal. That street car system has not been paying its actual monthly running expenses, to say nothing about interest on bonds, or dividends on stock. Yet the people have been charged enough for electric light to pay interest on the actual investment, interest on all this water, and interest on the street car system.

Now, prudent financial management would have stopped paying dividends on that street car system and would have begun to amortize the capital, knowing it was a dying system. That was not done. In buying these systems, we have tried to offer a fair, honest price for the actual values, that much and no more, and I believe those facts ought to be brought out in public discussion.

TVA Press Release of January 16, 1935

The Tennessee Valley Authority announced today that its Birmingham office will be opened Friday, January 18. The office, which occupies the first floor of the building at 1916 First Avenue, will be under the supervision of Mrs. Pattie R. Jacobs of Birmingham, who recently left NRA to accept this position with the Authority.

COMPLAINANTS' EXHIBIT No. 893 (Excluded)

It was announced at the same time that Miss Willie L. Byrd, also of Birmingham, has been employed as secretary to Mrs. Jacobs. Mrs. Jacobs will also be assisted by Claude Manning of the TVA.

The first floor of the building has been remodeled and an educational exhibit installed. In addition to having a regular staff of three, the office will serve TVA officials when in the Birmingham district.

The Authority now employs more than 6,400 persons in Alabama and its purchases in that state to date have totaled $1,250,000. For the construction of Pickwick Landing Dam, the Authority will expend approximately $1,000,000 in the Birmingham district for cement alone.

The educational exhibit in the fore part of the office consists of charts, maps and photographs which give a graphic explanation of many phases of TVA activities.

[fol. 3918] COMPLAINANTS' EXHIBIT No. 894 (Excluded)

TVA Press Release of May 13, 1935

Confidential Advance of Talk by Chairman Arthur E. Morgan, to be Given Before the Rotary Club of Columbus, Ohio, at Noon, Monday, May 13, 1935. For Release After 12 Noon, Monday

A private company could not afford to build Norris Dam, for it is not worth while of itself; the investment is too great for the power developed. It is profitable only because it will about double the prime power of all the dams down river. If these developments were in the hands of half a dozen companies, there would be no assurance to the company owning the Norris Dam and power plant that it would sell water it had stored. Owners of power plants down river could say "we do not need your stored water today," and would not use it except at unprofitable low prices. For years private industry had opportunity to build Norris Dam, and did not dare build it because there would be no assurance of cooperation with developments below. There is room ultimately for half a dozen or more great dams on the headwaters. These upriver dams need not only to be harmonized

COMPLAINANTS' EXHIBIT No. 894 (Excluded)

[fol. 3919] in their operation with the dams down river, but also with each other. A storm may fill one reservoir, while another is nearly empty. Only a single coordinated program can give full value at lowest cost. • • •

We are working on distribution of electric power. You have recently seen advertisements by the private power companies to the effect that the American people spend only one per cent of their income for electricity. That is a situation to be ashamed of, not to boast about. Americans should spend more than five per cent of their income for electric power. They would if it were cheap enough. At the Norris Dam we built one hundred and fifty houses properly equipped for electrical appliances, and we sell power at the low rates we think reasonable. Most of these are workmen's houses. We find the use of electric current in these small houses is about twenty times the average for American homes which are electrified. There is no surplus of electric power in America, only under-consumption. With reasonable rates, home use would double, and double again, and now industrial uses would add to our industries and to our prosperity. The Federal Power Commission reports a pending power shortage.

[fol. 3920] In my opinion, at the time the TVA was organized in 1933, of all the money paid for domestic power in America, only about half was a reasonable charge, and about half was unfair tribute taken from the people over and above a fair charge. Is it surprising that the little handful of men in control do not want to give up that source of financial power? Few Oriental monarchs ever had such tribute pouring in upon them. Since the organization of the TVA, power rates have been sharply reduced. In Cincinnati the reduction was more than a third. The president of the Commonwealth & Southern Corporation, which controls much of the South, testified before a committee of Congress that the TVA had forced their reductions. Before the same committee, the vice-president of the same organization testified that the TVA had nothing to do with it—that they would have reduced rates anyway. In our opinion there is still room for further reductions.

TVA Press Release of July 31, 1935

Dr. Arthur E. Morgan's Talk

Chattanooga Flood Protection District Commission, et al., at Chamber of Commerce on July 31, 1935

One of the first things that confronted us at the formation of the Tennessee Valley Authority was the flood problems in Chattanooga. We have had that in mind and have been working with it ever since. Your problem here is not one that is going to be solved over night. Information necessary to determine upon a definite program doesn't as yet exist. We have some of it, we are getting more of it, but with such information as we have nobody can say "This is a program to be followed." Before a program can be adopted, there is necessary a large amount of information and an exactness of information that is gradually being developed.

I have been interested in flood control now for something [fol. 3922] over thirty years, and necessarily have been very much interested in estimates as to what kinds of floods, what size of floods, what frequency of floods should be taken into account. It may not do much good to prepare against floods, if the floods you are preparing against are going to be greatly exceeded. Sometimes work that is being done may be a menace instead of a help if it is inadequate.

In Europe, floods have been recorded over such long periods that people have been somewhat adjusted to their recurrence. Even there, they have floods that cost a good many millions of dollars. This country has been built up rapidly. Most of our development has come between flood periods and there are cities in America that have never experienced floods of anything like the maximum that is bound to strike them some day.

In 1921, when the great flood occurred in Pueblo, Colorado, New York City papers asked me as to the full significance that flood had for the rest of the country. I remarked that I could indicate at least one city in New York that was just waiting for its disastrous flood. I got a telegram next day from a certain city in that state. The editors wanted to know if I meant their city. It happened that they had de- [fol. 3923] veloped a flood program of their own and had

built some local works. The works they had constructed were inadequate and they had a feeling of security whereas there was no security at all. A few weeks ago, there was a large flood in northern New York. If that flood had shifted its location one hundred miles, that city would have been very greatly damaged. That New York State city is waiting for its castastrophe.

At Dayton, Ohio, in about 1909, they had a flood, a serious one, which did a good deal of damage. The people got together to work out a flood control plan. They got some "level-headed" engineers who weren't going to be spectacular about the job. They recommended "A good sensible degree of flood control," issued bonds to secure that flood control, let contracts, and started to work. A few weeks after they started to work, a flood came along two and a half times the size they planned against, and destroyed a hundred million dollars worth of property and drowned hundreds of people.

When one makes a study of flood possibilities and determines what degree of flooding can occur, it is then necessary to face the facts so that we shall know whether we can get full security, and that we are not assuming that we [fol. 3924] have something when we do not have it. I think that is one of the first necessities in handling flood control. I think that is necessary here in Chattanooga.

You have a very serious flood control problem. Your region has not been settled long enough to discover what the maximum flood possibilities are. My engineering firm, during the past twenty-five years, has tried to exhaust all available records concerning flood possibilities. We have searched every scrap of record we could find in this country, Europe and Asia. What is the biggest flood of the last ten years? Fifty years? One hundred years or two hundred years? We have gradually formed in our minds a judgment as to what is likely to be the biggest in fifty years, and what the biggest in one hundred years. We feel that we have probably as good judgment as can be arrived at because we have spent much time and effort. Surprisingly, there is but a limited amount to be learned by studying the records of storms over a great deal of this country. The records do not run back very far. Of course, in almost any country some of the people soon begin to make measure-

ments on floods, but in recently settled countries it is difficult to get any good record that runs back very far. Even [fol. 3925] in the long-settled European countries, it is hard to find a river channel that has not changed its shape and size, one that has not changed its location from time to time, or along which the timber has not been cut, etc. It is hard to get a permanently definite shaped channel in which there has been recorded the height of water during floods over a long period, so that an engineer can determine how much water flowed in the channel.

In the case of the Tiber river at Rome, there has been so much filling of land, so much change in the shape and size of the channel, that stage records for two thousand years back don't mean much now. The same is true of many other streams. Some have been so changed by filling in banks, by building walls, and filling low lands, that you can't state what the flow was even though there are records of stage heights. One river on which there is a good permanent channel is the Danube in Austria. There, the channel is very definitely defined in a solid rock gorge. It happens to be in that natural channel that one of these old feudal barons built a castle in the narrow gorge. They were the forerunners of the present day monopolists. They blocked off the mountain highway and charged toll to everyone who [fol. 3926] passed by. These men made marks in the rocks indicating stages of water during floods a thousand years back, and we can get records of stages and records of quantities of water flowing, and frequency of occurrences. Here and there we find places where we can get such definite records. In this case on the Danube, we find that the greatest flood of nine hundred years was about fifty per cent greater than any other flood that occurred in that period. It occurred in the year 1055. Thus, it may be quite possible that a flood double the magnitude of any of record over a comparatively short period of years can occur. We have found a few cases like that.

We have gone over all the storm records of this country to get probable flood magnitudes. For instance, when the flood occurred in Dayton in 1913, it was twice as big as any that had occurred in one hundred twenty-five years, which was as far back as the records went. That is how a really great flood compares with a moderately great flood.

COMPLAINANTS' EXHIBIT No. 895 (Excluded)

Records aren't long enough to justify a definite judgment, but from our very general study for the past twenty-five or thirty years, and from our judgment, we believe that here in Chattanooga it is not only probable but it is almost certain that you can have floods during long intervals [fol. 3927] much greater than any floods you have ever had in your recorded history of the city. That fact has a bearing on flood control in this way. The biggest flood you have record of is that of 1867. Chattanooga was then a town of five thousand people. You wouldn't have drowned more than five thousand people whatever flood you had.

Suppose you go ahead and protect your city against floods by means of levees that are just about safe for the greatest flood of record. For a period of years you may develop undisturbed. You feel safe. You build your houses and factories in the low areas. Then suppose you have a flood ten feet higher than that for which you have provided. Your protection is overtopped and broken and the conditions are much worse that if you had no protection at all. When it does break, the water doesn't rise gradually—a few inches at a time—but comes in as a great wave and is extremely destructive. If you are to protect yourselves by levees you don't want any inadequate job done, you want protection against the ultimate floods.

If you happen to be in a place where you can improve the condition of a large channel the situation is different. Suppose you protect yourself by channel enlargement against an 1867 flood, and then a greater one occurs. In [fol. 3928] that case the channel enlargement would give partial protection. Whether it pays to have partial protection on the cost and on what happens if a greater flood than that provided for does occur.

I have handled flood control problems in a good many cities. It doesn't pay to pay for complete protection in some cases if an unusually great flood which may occur at infrequent intervals will cause only a moderate increase in flood damage. In such instances, it may be wiser to have protection from moderate floods or fairly big floods and stand the extra loss at long intervals. On the other hand, it is a serious matter to only get partial protection if you must depend on levees where a failure would be a complete failure and the catastrophe overwhelming. You don't want

anything to do with that type of protection unless you go all the way and make yourselves safe.

At Chattanooga, the chances for channel improvement seem to be very slight. The cost of widening this river through your city would be practically prohibitive. I think you can dismiss that prospect. You may improve somewhat by trimming up the banks, clearing trees, bettering the alignment, removing sand bars, etc. You might add ten [fol. 3929] per cent to the channel capacity in that way, and reduce the height of levees a few feet.

Generally speaking, there are two primary methods of protection available to you against main river floods: One is by levees that will keep the river out and the other by building reservoirs to hold back the water up river. These two seem to be the only proper approaches to protection from the main river. As to Chattanooga Creek, you have another problem. It may be possible to enclose that or to separate it by levees, but for main river it seems to rest primarily on levees or walls—about the same thing—and reservoirs. Chances for Chattanooga to protect itself entirely by local protection works are not good for the larger part of the town. It might be conceivable to protect much flooded area in the valley of Chattanooga Creek and some up the river without reservoirs. That would be an expensive undertaking. As to the up river parts of the city, it is a question whether the lay of the land is such as you can feasibly do the job independent of the storage above.

On the other hand, I think it is a fairly safe statement to say that there probably will not be enough dams built [fol. 3930] at any time in the near future to control Chattanooga floods. If we should build all the dams that have been suggested upstream, we might have all the storage necessary, and that might solve the flood problem in Chattanooga. The building of all of those dams is not to be expected within fifty or one hundred years. We expect that a few of the main ones may be built and these should cut the flood stages down to a point where you could supplement their action with local work, and the combined protection of dams and local protection works would make you safe. I suspect that is the most feasible way to handle the situation. Get all the storage you can above and supplement

with your own works. The two methods together will give protection.

The building of the Norris Dam will cut off about one-seventh of your flood possibilities. The Fowler Bend Dam on the Hiwassee River will cut off about half as much as Norris Dam. But you would need five times as much reservoir storage to complete the job. If a large storage dam could be built on the French Broad and another on the Holston, and if the proposed development on the Little Tennessee should be carried through, then I think the problem would be brought down to where you could handle it yourselves within reasonable limits of cost.

[fol. 3931] Consider now the dams on the main river. They will help in moderate floods; in great floods they do not mean very much. The Chickamauga dam, for instance, will help in more moderate floods. In times of great flood, Chickamauga will amount to very little in control of floods here.

With storage reservoirs on the main tributaries, Chickamauga would then add to protection. Without those storage reservoirs, Chickamauga will help with the moderate floods, but in the greatest floods it will be of no advantage at all. You can't count on Chickamauga Dam plus levees to do the job. You must rely on upstream reservoirs.

The situation in Chattanooga is one of the most serious in the country from the point of view of flood danger. It isn't very popular to say that, but it is a public duty to direct attention to the conditions, so that you may not discover it all at once with a great loss of life and tremendous loss of property.

As to what the proper program should be for Chattanooga in relation to floods, I think your first necessity is that of knowing the facts. We don't, today, know what the possibilities are. Suitable designs cannot be made without [fol. 3932] reliable surveys and information. There have been surveys—limited surveys—but at no time has there been a collection of information that is adequate for handling the problem.

There are such problems as that of enlarging the gorge below Chattanooga. That is an intriguing possibility, but the cost has never been determined. Whether it would be possible to lower the flood stage through the city three or

four feet by that method, or whether the cost of widening and deepening the river for a number of miles is entirely too great; we do not know, as to the cost of diverting Chattanooga Creek in an effective manner and the cost of pumping the water from the local areas during floods. I think that problem has had no more than a good guess. As to the cost of moving railroad yards above the mouth of Chattanooga Creek or possibly combining all railroad yards in the present flooded lands, I think there has not been adequate information assembled.

The first necessity is to get information thoroughly developed so that the possibilities will be fully known, and danger of flood frequency can be known as well as can be estimated, and the effects of the reservoir construction should be fully understood, and then I think probably a program as to how to handle the situation can be worked out.

[fol. 3933] In the meantime, a program of how to handle a flood before you have your full protection should be worked out so that you have a definite plan of campaign in case of flood. What you would do first on the approach of a flood, how you would give warnings, how you get people out of the low lands, just how to handle the situation point by point. With reference to individual industries, each should be informed regarding what danger it is in. It should be possible to work out methods of handling the individual industries in time of flood. It is possible to have a program worked out so that with flood warnings given, industries in the flood area could get perishable goods upstairs out of reach of the water. In some cases it may be possible to build water-tight walls around buildings and so greatly reduce probable damages.

The possibility of damage and loss of life in your poor residence districts in these floods is very great. I have seen whole blocks of houses in other cities piled up and jammed together until they caught fire and burned. Experiences like that are tragic. And you are all ready for such experience here. You have hundreds of houses on flood land here that would be entirely covered by any great flood rise.

[fol. 3934] In handling Tennessee River as a whole—while Chattanooga is the largest city on the river, it is

COMPLAINANTS' EXHIBIT No. 895 (Excluded)

still a small element in the whole pattern of the valley, and I am inclined to think that flood control for Chattanooga must be an incident in the main program of navigation, flood control, and power.

I can't see a way out for Chattanooga acting by itself alone. It seems to me you are in the same boat with the whole Tennessee Valley, and that your salvation lies in the continued development of the TVA program, especially as to those storage dams above you. I think one is speaking for the interests of Chattanooga when he speaks for those projects up river. They are essential to your safety and their construction is your first reliance.

[fol. 3935] COMPLAINANTS' EXHIBIT No. 896 (Excluded)

TVA Press Release of September 22, 1935

Fayetteville, Tenn.—Fayetteville and Lincoln County are looking forward to entertaining Mrs. Franklin D. Roosevelt, Secretary of State Cordell Hull, Speaker Joseph W. Byrnes of the House of Representatives, the Directors of the Tennessee Valley Authority and a long list of notables at a large celebration, which the citizens of Fayetteville and Lincoln County are sponsoring on October — when the first segment of the new TVA rural electrification * * * in Lincoln County will be put into service and taken over from TVA by the newly formed Lincoln County Electric Membership Association.

The electrification network in Lincoln County comprising the first TVA rural electrification project to be put into operation in Tennessee. When completed, it will consist of approximately miles of rural lines serving the communities of Camargo, Moline, Blanche, Elora, Kelso, Coldwater, McBurg, Boons Hill, Lincoln, Flintville, Belleville, Howell Hill, Taft, Cyruston, Cash Point, Bellview, Frankewing, Mimosa, Kirkland, Liberty, Brighton, Yukon, Pearl City and Egam. All of these communities will be represented in the celebration. Other rural systems now [fol. 3936] being projected in Tennessee are Rhea, McMinn, Meigs, Giles, Harden and Haywood Counties. * * *

Invitations have been sent to Governor Hill McAllister of Tennessee; Governor Bibb Graves of Alabama; Senators

COMPLAINANTS' EXHIBIT No. 896 (Excluded)

Kenneth McKellar and Nathan L. Bachman of Tenn. Congressman J. Ridl Mitchell and the entire Tennessee Congressional delegation; O. C. Van Cleve, Tennessee Commissioner of agriculture; L. R. Neal of the Tennessee agricultural experiment station at Columbia; J. Frank Porter of the Farm Bureau of Tennessee; the members of the Tennessee Rural Electrification Board and State Planning Board; Mayor Hila E. Howse of Nashville; Mayor Watkins Overton of Memphis; Mayor Ed. Bass of Chattanooga; James G. Stahlman, publisher of the Nashville Banner, George Fort Milton, editor of the Chattanooga News; Julian Harris, editor of the Chattanooga Times; Marshall McNeill, editor of the Knoxville News Sentinel; Lit Purdue, publisher of the Nashville Tennessean; Edward J. Meeman, editor of the Memphis Press-Scimitar; George Morris, assistant publisher of the Memphis Commercial Appeal.

The mayors of cities in middle Tennessee and North Alabama have been invited to attend and to appoint delegations to represent their cities at the celebration. The Ten- [fol. 3937] nessee cities include Lewisburg, Pulaski, Winchester, Columbia, Lawrenceburg, Murfreesboro, Dickson, Franklin, Shelbyville, Lynchburg, Elkton, Manchester, McMinnville and Mount Pleasant. The Alabama cities include Scotsboro, Huntsville, Athens, Guntersville, Decatur, Hartselle and Ardmore.

TVA Press Release of October 1, 1935

Bringing Electricity to the Farm

Advance Text—Excerpts of Speech by David E. Lilienthal, Director, Tennessee Valley Authority, at Celebration Upon Opening of Farm Lines of Lincoln County, Tennessee) Electric Membership Association, Fayetteville, Tennessee, October 1, 1935

Above all else, the American people today demand action of their government. Talking and discussing and planning are necessary, but what the country wants is action—and

plenty of it. To me, TVA is the New Deal in action. This [fol. 3939] celebration today is part of that action.

Two years ago TVA had a mere handful of employees. A big job had been handed to it. It had to lay plans. It had to build up an organization. It had to take all the steps that are preliminary to action. Those plans and preliminary steps were taken and action began almost at once. Today, as you know, only two years after the very beginning up on the Clinch River, TVA has moved a mountainside into a canyon and is ninety per cent completed with the construction of Norris Dam. More than 900,000 cubic yards of concrete have already been placed. Today, less than two years after TVA began work at Wheeler, that dam is also within a relatively few months of completion, stretching a mile across the Tennessee River. Pickwick Landing Dam is well under way, with thousands of men working night and day to rush that job along. After lying idle for twelve years, electricity from Wilson Dam is now bringing comforts to the homes of thousands of our neighbors. A fertilizer plant has been built and is producing, and that fertilizer is being applied on demonstration farms in more than eighty counties throughout the length and breadth of this area. That is action—the kind of action the American people expect and have a right to demand of their government.

[fol. 3940] There is the same demand for action to bring electricity to the farm. We have talked about the electrification of farms in this country for a good many years. You have heard a great deal about it. It has been discussed. Hopes have been expressed. Plans have been laid. There has been talk and talk and talk. What the farmers now need in order to get electricity is some action—sensible and intelligent action—but action, not more talk and more promises. We are in the action stage here today. This occasion today celebrates action about farm electricity. Today a ten year old youngster has thrown a switch, and electricity is at the service of many of your neighbors. More action is right ahead. By the first of January your Association will have 110 miles of lines in Lincoln County, with 1100 farm homes being served. As you know, the same thing is happening elsewhere where the farmers, the townspeople, and TVA together have tackled this prob-

lem of bringing electricity to the farmer and his family.

Up to the present, electricity has been denied the farmers of the Tennessee Valley area. After all these years of talk, and in spite of the great need and insistent demand, only two farms have electricity out of every hundred in the Ten- [fol. 3941] nessee Valley Area. Ninety-eight farms out of every hundred are still without it. These are the facts. We can deplore it; we can listen to the reasons and the alibis time without end. But the stubborn fact remains that at this late day ninety-eight farmers and their families out of a hundred are still without electricity in this area. That situation is going to change. It must change. It will change, if that group of selfish interests that have steadily bled the farmers for a generation doesn't block the way. TVA and the farmers and townspeople, working together, are going to see to that. It won't be changed by mere talk, but by action—the kind of action that you and TVA have taken in Lincoln County in recent months.

What is going on in Lincoln County is going on in other parts of the Tennessee Valley area. You know, for example, about the Alcorn County Electric Power Association in northeastern Mississippi. There the city of Corinth and the farms and villages throughout the county are working the problem out on a countywide basis. Down there they have recognized what you recognize here, and what I believe will soon be generally recognized—that to really do this job of farm electrification adequately, the town and the country must join hands. County after County in [fol. 3942] Mississippi and in Tennessee have already followed this principle of the town and the country going together to see to it that electricity is cheap and abundant all over the country. They realize, and I can't emphasize this too much, that for farmers to get electricity widely, the town must cooperate with the country. That is a sound business proposition. It is sound public policy. That's just what they've done in seven Mississippi counties served by TVA; town and country have joined a single association and are pulling together. The plan works. In Alcorn County they cut rates 50%. Yet at the end of the first year the Association had 37¢ of every dollar they took in, as net profit. And remember; that profit stayed in the local community. It wasn't drained out of the county by

outsiders. It meant more money in circulation right there at home.

It won't be many years until those folks in the county-wide associations will own their own electric systems free of the last cent of debt. For example, Alcorn County paid $51,000 off on their initial debt of $114,000 (almost half) in a little more than a year. When the debt is all paid off then rates can be cut even lower, for there won't be interest and amortization to take care of. Their plans are working [fol. 3943] out successfully because they are based on these three sound principles of business:

1. Low rates and plentiful use of power;

2. Town and country together;

3. Keep the profits at home, with consumers as business partners.

You are making history here today. What you are doing here in Lincoln County I believe will spread all over this Valley. Farmers, I believe, realize that farm life cannot take its rightful place in the life of the whole community so long as it continues to be true, as it is in the Tennessee Valley area, that only two farms out of a hundred have electricity. The farmers and their families are headed for action and are going to get it, the town and the country working together and the TVA cooperating with both. They are getting ready for action, and plenty of it, in your neighboring community, Giles County. Pulaski is the town and Giles County is the farm — community working together to get rural electricity throughout that County. The same thing is going on at Dayton and its farm neighborhood. So with West Tennessee, where we look forward to the cooperation of the towns in that area in getting electricity to farmers through perhaps twenty-five counties.

[fol. 3944] TVA has an ample source of electricity from the Tennessee River. That electricity belongs to all of us. Transmission lines are being built. The townspeiple want to cooperate. Your Senators and Congressmen have put their shoulders to the wheel. The State has cooperated through the Acts of the Legislature, through the Tennessee

COMPLAINANTS' EXHIBIT No. 897 (Excluded)

Rural Electrification Administration, and the help of your far-sighted Governor. The farmers and their representatives and agencies are working together. With cooperation as the formula, we will have more action like that in Lincoln County, like the action in the many counties in Mississippi, like the action in Giles County and in Rhea County. And I don't hesitate to predict that the time is soon at hand when the disgrace, for it is nothing less than a disgrace, of having only two farms in the Tennessee Valley out of a hundred electrified, will be a thing of the past.

[fol. 3945] COMPLAINANTS' EXHIBIT No. 898 (Excluded)

TVA Press Release of October 21, 1935

Tupelo, Miss., Oct. 21.—The sixth cooperative electric power association supplying TVA power to small towns and rural areas was formally launched here today with the signing of a contract between the TVA and the Tombigbee Electric Power Association, which will take over and operate the present TVA lines in Lee and Itawamba Counties, Mississippi, beginning November 1, 1935.

The property transferred is valued at more than $350,000 and will, at the outset, supply electric service at TVA rates to 1,742 customers, located in the communities of Guntown, Saltillo, Sherman, Verona, East Tupelo, Shannon, Nettleton, Fulton, and a series of rural lines. The Tombigbee Association is the first TVA cooperative association to undertake to serve the whole of two counties. The main office will be located in Tupelo, county seat of Lee County, and a collection and service office will also be located in Fulton, county seat of Itawamba County. The Executive Committee of the new association is as follows:

[fol. 3946]

President	Keith Barnett, Nettleton
1st Vice-Pres.	Rex Reed, Tupelo, R. F. D.
2nd Vice-Pres.	G. T. Mitchell, Guntown
Treasurer	V. S. Whiteside, Tupelo, R. F. D.
	A. J. Mattox, Fulton

COMPLAINANTS' EXHIBIT No. 898 (Excluded)

The Tombigbee Electric Power Association is the sixth non-profit cooperative association now engaged in the distribution of TVA power. The first of these associations was the Alcorn County Electric Power Association, which began operations on June 1, 1934. Since then similar associations have gone into operation in Pontotoc, Prentiss, and Tishomingo Counties, Mississippi, and Lincoln County, Tennessee. Other associations have been organized and are now planning construction of lines in Rhea and Meigs Counties, Tennessee, Monroe County, Mississippi, and other areas in the Tennessee Valley.

TVA Press Release of October 24, 1935

Power Shortage and Business Recovery

Excerpts from Address of David E. Lilienthal, Delivered at Eight-County Mass Meeting at Dickson, Tennessee, on October 24, 1935

This is an unusually interesting gathering. For here in this enterprising city farmers from a half dozen counties in the trade area of Dickson have come together with the residents of your city. You are drawn together by your interest in the greatest force of modern times: Electricity. This meeting is itself a demonstration in concrete form that town and country are bound together in ties of mutual interest, and that when they cooperate, that cooperation benefits both the farmer and his neighbor in the city.

First of all I want to talk to you of a subject that is of interest to those of you, particularly the business men, who live in Dickson and other towns and cities. And then let [fol. 3948] me describe what is going on in this Valley in the job of getting electricity to the farmers who have for so long been denied its benefits. Those two phases of electricity—in the town and the country—are part of a single picture—they fit together.

Within the past twelve months the United States has gone a long way toward recovery and prosperity. This

COMPLAINANTS' EXHIBIT No. 899 (Excluded)

movement has been notable and marked in the Tennessee Valley region. The full recovery of the country and its onward stride toward a new level of prosperity for all depends in large measure upon an adequate, abundant, and cheap source of electrical power.

What is true of the United States as a whole is true also of individual communities. A town or city which has an abundant and cheap source of electricity has a great opportunity and advantage in the march toward recovery. A community which is not assured of an almost unlimited supply of cheap electricity may be under a genuine handicap. Throughout the country you will find business men who are thinking of the progress of their city, and city officials who are thinking of industrial payrolls and property values for their cities are equally determined [fol. 3949] that their town or their city shall have an abundant supply of cheap electricity, for the expansion of industry that lies ahead for the country and for our region.

A shortage of power would be nothing less than a calamity. A power shortage would put hobbles on business, retard recovery, destroy returned confidence. And yet that is what the Tennessee Valley region might be facing next summer if Norris Dam were not ahead of schedule, and ready to store water next February. The business men of the Tennessee Valley region can give the order "Full speed ahead" secure in the knowledge that there will be an adequate supply available for the period of renewed activity which lies ahead.

When TVA was planning the installation of power generating facilities in the navigation and flood control dams at Norris and Wheeler, you heard a good deal of criticism from certain quarters. The utilities said: "There is a huge surplus of electricity in this area now; don't add to this surplus." But you don't hear much about this "power surplus" in recent months and weeks—and you probably won't hear much about it, because the "huge surplus" of dependable power just doesn't exist. Lower rates and industrial recovery have brought consumption of electricity [fol. 3950] throughout the country and in this area to a new all-time peak. For example, production of power in this region in July was 21% higher than in July a year ago. Domestic use has made sensational gains. New uses

for industrial power are appearing. Old steam plants that have not been operated for a long time have been pressed into service. If Norris Dam had been completed last winter all the extra power its stored water would produce would be valuable and have a ready sale, and at the same time water levels for navigation would be improved.

This has been a very dry year. That is no justification for a power shortage. Factories have to have power in dry seasons as well as normal ones; homes and farms need electricity regardless of rainfall. The dry years come and must be planned for. An adequate supply of electricity must take dry years into account, and emergencies of all kinds require an adequate reserve.

We are just entering the power age. No man can see what lies ahead. The use of power has increased by leaps and bounds right through the depression. The "saturation point" in electric use is hardly fixed until it has been far exceeded. What low rates will do has already been demonstrated in your neighbor cities using TVA electricity. [fol. 3951] Under low TVA rates the people of Alcorn County, Mississippi, used three times as much electricity as they had under high rates, all in the course of a single year. Comparable results in even shorter periods have been experienced elsewhere in Pulaski and Dayton, Tennessee, in Athens, Alabama, and in other towns. The private utilities have also had a remarkable growth in use. And we are only at the beginning. A power plant adequate today may be wholly inadequate a year hence, as the people really put the force of electricity to work for them.

If every individual town and city had to build a generating plant large enough to care for all the future growth required by industrial expansion and increased home and farm use, it might well tax the resources of that town; but when a number of towns are connected together with high transmission lines to a large potential source of power supply produced at very low cost, the communities that are so served have a great advantage in cost and in assurance of supply.

I suppose it was considerations of this kind that were in the minds of your city officials when they conferred with the Tennessee Valley Authority more than a year ago seeking a source of power supply from the Tennessee Valley

COMPLAINANTS' EXHIBIT No. 899 (Excluded)

[fol. 3952] Authority. I have been told that when your municipal electric plant was constructed it was adequate for the needs of your city, but as the city has grown, as the use of electricity expanded, that plant has gradually become inadequate. To replace or add to this plant would involve the city in a large capital expenditure. But the Tennessee Valley Authority has under construction certain dams which will make the Tennessee River navigable and aid in the prevention of floods, and at the same time and with the same structures, be capable of producing large quantities of cheap hydroelectricity. These structures in the Tennessee River make possible a supply of power from which all the various communities of the Tennessee Valley region within transmision distance may draw. And remember this: The potential power in the Tennessee River belongs to you. That power is ready to work for you and your fellow citizens throughout this region.

The directors of TVA have been gratified to find throughout this Valley that the people of the towns have been intensely interested in cooperating to get electricity to the farmers of their trade area. Dozens of business men and city officials have talked to me on this subject. With few [fol. 3953] exceptions they have taken the same position: They realize that the town is the key to the problem of getting electricity to the farmer. And throughout this Valley the town and the country are cooperating. It is not something in the future. It is here. The plan is at work. It benefits the town by developing its trade area, by improving its relations with its farm neighbors and customers, and by giving the farmer additional means of increasing his income. And it benefits the farming communities, relieving the farmer of much of the drudgery of the farm and giving him a tool by which he can increase his income and make farm life more attractive and satisfying.

[fol. 3954] COMPLAINANTS' EXHIBIT No. 900 (Excluded)

TVA Press Release of November 2, 1935

Completion of the first steps in negotiations for the TVA transmission loop in West Tennessee was announced last night by David E. Lilienthal, director and general counsel. Mr. Lilienthal reviewed details of the proposed $1,000,000, transmission line uniting 8 municipal light and power plants in West Tennessee, Bolivar, Somerville, Trenton, Milan, Covington, Dyersburg, Jackson, and Union City. He said the plan, which was drafted at the request of the West Tennessee Mayors Association, had now been submitted to the Mayors of all 8 cities.

"To explain details of the plan and to cooperate in working out individual contracts adaptable to special conditions of each city," Mr. Lilienthal said, "Representatives of the Authority have been stationed in Jackson for the past few weeks and have held meetings with city officials and groups of citizens in all cities.

"Rural meetings have also been held in each of the counties affected to obtain preliminary information so that rural lines may be constructed just as soon as the cities take [fol. 3955] action and thus make sources of TVA power available in their trade areas.

"Several of the cities have already signed contracts for TVA power and in the other cities committees have been appointed or consultants engaged to study the matter further and, when ready, to consult with the Authority.

"Definite action in the construction of the loop must now await the outcome of these studies and action by the remaining municipalities. This will necessarily take some time. However, our engineers are already at work on plans for supplying service to municipalities and rural areas immediately adjacent, so that construction may be rushed forward without delay when a decision is reached by the municipalities concerned."

TVA Press Release of November 26, 1935

The Work of The Tennessee Valley Authority

Advance Text of Remarks of David E. Lilienthal, Director and General Counsel, Tennessee Valley Authority, Before a Meeting at Louisville, Kentucky, under the Auspices of the City of Louisville, November 25, 1935, at 8:00 P. M., held at the Auditorium

Kentucky is one of the states most directly affected by the work of the Tennessee Valley Authority. The headwaters of the river rise near your borders, and it is in this state, at Paducah, that the Tennessee River joins the Ohio. One of the principal dams of the Tennessee Valley Authority now nearing completion is only twenty-five miles from the soil of your state. And it is in Kentucky that TVA for some time has been exploring foundations for a huge dam on the lower river. But most important of all, Kentucky, by geography, soil, climate, culture, and history, is natural kin to that vast area in which President Roosevelt and Congress have set up the country's first program of region-wide development.

Close as TVA is to you of Kentucky, it is quite likely that most of you have no more than a fragmentary picture of this project, gathered from newspaper accounts or perhaps from a visit to one of the construction sites. I am therefore particularly pleased at this opportunity to describe the project as a whole, to attempt to tell you the [fol. 3957] objectives of the TVA as laid down by Congress and the action the Authority has taken in its two and a half years of life to translate those objectives into actual accomplishment.

The TVA is something new in American government, but the problems it was directed to work out are by no means new. Nor are those problems peculiar to one section of the country; they are critical national problems, concerned with the basic resources upon which the well-being of the entire country depends: (1) the control and use of our water; (2) the preservation of our land—our soil; and (3) the more widespread use of our chief source of energy—electricity.

The background, the setting of TVA's activities with respect to land, water resources, and electricity are well-known

to all of you; for Kentucky is one of the seven states of the Tennessee Valley. The other states forming part of the Tennessee Valley, as you probably recall, are North Carolina, Virginia, Tennessee, Alabama, Georgia, and Mississippi. In this great drainage basin are more than twenty million acres of land of every kind and description; the highest mountains in the United States east of the Rockies: rolling country; flat lowlands; forests; every kind of land [fol. 3958] from the richest to the poorest. Most of you have traveled through the region by automobile and know how varied a region it is: cotton, tobacco, corn, cattle, mining, manufacture of every description. I hope you will keep this picture of the Tennessee Valley area in mind while we are discussing the job the President and Congress turned over to the TVA and what we have been trying to do to meet these obligations. • • •

"I spoke earlier of three national issues TVA was concerned with: (1) the control and utilization of water resources on a regional basis; (2) stopping our waste of soil; and (3) a wider use of electricity, our major source of energy in the home and the factory.

• • • • • • •

Mr. Lilienthal explained how the construction of dams by the TVA for navigation and flood control necessarily resulted in the creation of water power by the same structure that provides for navigation and flood control.

• • • • • • •

Shall this vast power in the water of a public stream be wasted, or shall it be used to relieve men and women of drudgery, give them comforts and conveniences, and turn the wheels of industry? To ask the question is to answer it. [fol. 3959] The thought of wasting a great source of energy is against every American tradition. And so President Roosevelt and Congress have provided that the power in the Tennessee River shall no longer run unused to the sea, but that power shall be put to work.

The production of power by these navigation and flood control dams furnishes the answer, in part, to the question: "How is this vast project to be paid for?" By selling the power the Federal Government will receive a cash return

which will not only make the electricity program self-supporting, but in the course of years will repay the investment in the navigation and flood control works.

TVA at present has only one dam in operation, that is at Muscle Shoals. From this dam the Authority has realized operating revenues totaling $1,850,000. In the last four months alone, power of a value of $452,000 was produced and used. The TVA has signed contracts for the sale of the entire output of Wilson Dam, though most of this revenue cannot be received until pending litigation is decided.

You are familiar with the fact that contracts with TVA contain a schedule of electricity rates which are often described as "yardstick" rates. In creating TVA, Congress in effect declared it to be the Government's policy to dis- [fol. 3960] tribute the surplus power, necessarily created by navigation and flood control dams, at the lowest possible rates and in such a manner as to encourage increased domestic and rural use of electricity. A number of electric cooperative associations have been formed in the area of the Authority's operations. These organizations and a number of municipalities purchase power from TVA at wholesale and distribute to ultimate consumers. The experience of these distributors of TVA power has been a remarkable demonstration of the effect of reduced electric rates on the extent to which people will put electricity to work for them. The so-called TVA rates for home use begin at 3¢ per kilowatt hour and with greater use decrease to as low as 4 mills per kilowatt hour. A householder having lights, an electric refrigerator, washing machine, vacuum sweeper, toaster, and iron, and doing all cooking by electricity, pays about $5.00 a month where these rates are in effect. Establishment of these rates by the wholesale customers of TVA effected an initial rate cut of 50% and yielded an average saving to users of approximately 2¢ for every kilowatt hour used. • • •

We are in a new age, the age of electricity. No man today can foresee what electricity holds for us a decade hence. [fol. 3961] And yet the American people are being barred from the full benefits *fo* the era of electricity by rates that prevent a full use of this servant of men. I believe the people of the country are going to demand an end of high rates and low use of electricity. Low rates are financially sound;

COMPLAINANTS' EXHIBIT No. 901 (Excluded)

they are necessary to our national well-being; they mean an electrified America.

We have been asked many times whether TVA electricity will be available in Kentucky. The answer is yes. The TVA law requires the Authority to provide for an equitable distribution of the power among the states, municipalities, and other agencies within reasonable transmission distance of the dams. Norris Dam is within transmission distance of Kentucky, of course, being only twenty-five miles from the state line.

A great backlog of cheap power at Kentucky's door, supplementing its present sources of supply, is a great asset to the whole state. The power resources of the country are today undergoing a strain to meet the needs. This is due to a number of factors: the resumption of industrial activity, the effect of low rates in increasing use, the discovery of new uses for power, the needs of widespread farm electrification just ahead. In some parts of the country a power [fol. 3962] shortage is something to give real concern. That would be a calamity, and block business recovery. Whatever may be true elsewhere, the early completion of Norris and Wheeler Dams by the TVA will prevent a shortage in this area. The people of the Tennessee Valley can proceed with their plans for industrial expansion and rural electrification secure in an adequate supply of cheap electricity.

[fol. 3963] COMPLAINANTS' EXHIBIT No. 902 (Excluded)

TVA Press Release of July 29, 1936

Address Before TVA Employees, by Arthur E. Morgan, First Methodist Church, Knoxville, Tennessee, July 29, 1936

There are many ways in which we may work in this region toward a better ordered social and economic life, such as the President has so often expressed as his idea of the proper work of the TVA. Sometimes those results can be secured by simply furnishing an opportunity, sometimes by a little benevolent despotism. The Tennessee Valley Authority has used both. For instance, there is our training program. We might have compelled workmen to take those courses. We might have said, you are perfectly free to work for the

COMPLAINANTS' EXHIBIT No. 902 (Excluded)

TVA or not as you choose, but if you choose to work for us you must take part in our training program. We did not do that. We simply offered the opportunities. We did not require workmen to accept them, and we did not offer any additional security to those who did so. That is an example of assistance without any compulsion.

In other fields, however, it sometimes occurs that it seems better for us to impose our judgment upon the localities, [fol. 3964] to use a certain amount of benevolent despotism, to say from the outside that we have better judgment and greater experience and that we should dictate what the course should be. Sometimes one way seems better and sometimes the other. For instance, we might leave the determination of electric power rates to the communities. However, we have a picture of what would be a good policy for the communities, and so we ask the individual communities to defer to the TVA judgment; we want to say not only what we shall be paid for current but what it shall be sold for to each person in the community. In that case it is not enough to simply present an opportunity, we specifically dictate for the good of the community. Sometimes we must work by the free choice of methods as in our training program. Sometimes we work by benevolent dictation as in our power rates. We will find that the TVA is too complex, to- varied a job to set any hard and fast method. We must feel our way and work by rule of reasonableness rather than by rule of government.

(Omitted)

[fol. 3971] COMPLAINANTS' EXHIBIT 910-A

TVA Water Control Bulletin, Dated December 19, 1936

The Water Control Committee advises that at each flood this winter, Wheeler Reservoir will be filled to elevation 556. The reservoir will be operated for the control of floods at Pickwick and other critical points below Wilson Dam so far as possible, with the incidental benefits in the way of regulation of flood flows in the Mississippi River. To accomplish this, the operation will follow a schedule approximately as follows:

After the passage of each flood the reservoir will be slowly drawn down at about the rate of 2 feet per week until it reaches level 553, where it will be held until the approach of the next flood. Just before the occurrence of a flood the reservoir will be drawn down as much more as seems necessary, but not below 550. Then during the flood it will be filled up to 556, at such a time as to be of most benefit to Pickwick.

RURAL ELECTRIFICATION SURVEY

Neighborhood Plan

Instructions to County Chairmen

GENERAL

The following pages outline a suggested "Neighborhood Plan" for conducting rural electrification surveys. It is intended that the plan shall be simple, clear cut and practical, so that interested local groups such as the Farm Bureaus may conduct their own surveys, and thus save considerable time and expense in finding out if rural lines are practical in their area.

This plan is not arbitrary or final. Minor changes may be made to fit local conditions. Therefore, before starting the survey it is desirable for the local Chairman or Committee to arrange a meeting with the nearest representative of the TVA's Department of Electricity. (His name and address can be obtained by writing to the Division of Electrical Development, Old Post Office, Chattanoog, Tenn.). He will then be able to answer questions, and assist with plans for your survey.

SURVEY MATERIAL

It is first suggested that you read carefully the material contained in this Manual.

As explained in the "Information Sheet" (Sheet 2), the main emphasis of the plan is on the profitable use of electricity by the consumer. Naturally rural lines cannot be built unless there is enough business or revenue to make the line self-supporting. But instead of the "old-fashioned" methods of obtaining enough revenue through high rates or heavy line charges, or through cash contributions to the cost of the lines, this plan seeks to solve the problem in a way that will give the customer maximum profit and pleasure from

Instructions to County Chairmen

GENERAL

The following pages outline a suggested "Neighborhood Plan" for conducting rural electrification surveys. It is intended that the plan shall be simple, clear cut and practical, so that interested local groups such as the Farm Bureaus may conduct their own surveys, and thus save considerable time and expense in finding out if rural lines are practical in their area.

This plan is not arbitrary or final. Minor changes may be made to fit local conditions. Therefore, before starting the survey it is desirable for the local Chairman or Committee to arrange a meeting with the nearest representative of the TVA's Department of Electricity. (His name and address can be obtained by writing to the Division of Electrical Development, Old Post Office, Chattanoog, Tenn.). He will then be able to answer questions, and assist with plans for your survey.

SURVEY MATERIAL

It is first suggested that you read carefully the material contained in this Manual.

As explained in the "Information Sheet" (Sheet 2), the main emphasis of the plan is on the profitable use of electricity by the consumer. Naturally rural lines cannot be built unless there is enough business or revenue to make the line self-supporting. But instead of the "old-fashioned" methods of obtaining enough revenue through high rates or heavy line charges, or through cash contributions to the cost of the lines, this plan seeks to solve the problem in a way that will give the customer maximum profit and pleasure from his electric service. Rates are low. There are no line charges. The farmer is not asked to buy any stock or to make any cash contributions for poles or lines or transformers.

Instead of all these outlays, the farmer is asked only to share in the program by agreeing to install such electric equipment on his own farm as he needs and can afford. Thus his money stays at home and works for him on his farm.

By experience, the average electric use (in kilowatt hours) of most types of equipment is pretty well known (see Information Sheet, page 1), and so, after the farmers have indicated (on Sheet 3) what equipment they agree to buy, it is possible to estimate the use of this equipment, add up the total for any given extension, and see if the revenue from this much use will be enough to justify the cost of the line.

There is no fixed rule as to what is "enough business." This will vary, depending on the cost of the line and other factors. However, experience in other communities in the Tennessee Valley has shown that lines are generally feasible when customers agree to install enough equipment to use an average of 662 kilowatt hours per month per mile of line; and where surveys reach this total, it has in most cases been possible to arrange for construction of the lines either through TVA or the Rural Electrification Administration. In over 20 counties of Tennessee, Alabama, and Mississippi rural lines have been built or are under construction to serve farmers and in most cases they have been surveyed by this Neighborhood Plan, using the objective of 662 kilowatt hours per month per mile of line. It is generally agreed that this plan is more practical and workable than any other previously attempted. But it should be pointed out that its success must always depend on two things: 1. An active and enthusiastic committee of volunteer canvassers; 2. An understanding, by the farmers, of the many profitable uses of electricity on the farm.

The last point is the most important. Many farmers still think of electricity as "lights and radio." If this is all they use, then no project can ever be successful. The main job of the committee and canvassers is an educational job, explaining the many money-making and money-saving uses of electricity on the farm, so that the farmers will gladly sign up for enough equipment to reach the objective.

the revenue from this much use will be enough to justify the cost of the line.

There is no fixed rule as to what is "enough business." This will vary, depending on the cost of the line and other factors. However, experience in other communities in the Tennessee Valley has shown that lines are generally feasible when customers agree to install enough equipment to use an average of 662 kilowatt hours per month per mile of line; and where surveys reach this total, it has in most cases been possible to arrange for construction of the lines either through TVA or the Rural Electrification Administration. The last point is the most important. Many farmers still think of electricity as "lights and radio." If this is all they use, then no project can ever be successful. The main job of the committee and canvassers is an educational job, explaining the many money-making and money-saving uses of electricity on the farm, so that the farmers will gladly sign up for enough equipment to reach the objective.

PROCEDURE

In preparing for a survey the following supplies are required:

1. One large County Map
2. One Chairman's Manual.
3. One Information Sheet per customer (Sheet 2).
4. One Customer's Application Agreement per customer (Sheet 3).
5. One Canvasser's Mileage Sheet per 8 customers (Sheet 4).

The county map must be obtained locally. Samples of other forms are attached, and additional copies may be obtained by application to the address given on the preceding page. In estimating the number required, the following considerations should be kept in mind: (1)

3935

for extensions to ar as immediately adjacent to existing rural lines furnishing TVA power, any number of applicants may be considered provided the proposed extensions meets the necessary requirements per mile of line; (2) in areas calling for the formation of a separate county power association, it is wise to plan for at least 400 or 500 customers along not more than 70 or 80 miles of line.

In organizing the survey, it is first recommended that the Canvassers or Committee Members be called together by the Chairman, and that a TVA representative be present to answer questions and explain details. The areas to be surveyed should then be blocked out, and one area assigned to each Canvasser, who should be given an adequate supply of Information Sheets (Sheet 2), Customer Application Agreements (Sheet3) and Canvasser's Mileage Sheets (Sheet 4). Full instructions should be given and a definite date set, at which time Canvassers should report back and turn in the completed Agreements to the Chairman. Than call in the TVA representative to determine feasibility of the project. Where feasible projedts have been prepared, he can then outline the necessary legal, financial and engineering steps which must be taken for final action.

Notes: For the sake of brevity, this review omits discussion of several details which are apt to vary in different areas. These should be discussed with the TVA representative and carefully explained to the Canvassers, covering particularly the following matters:

1. Proposed seurce of energy supply.
2. Proposed method of organization.
3. Policy on computing customer tap lines over 200 feet in length.
4. Policy on surveying areas served in part by existing lines.

Emphasis must be placed on the need for thorough instruction on the uses of electricity. Canvassers should be grounded on all the facts contained in the Information Sheet and instructed to review these sheets with each customer. Much help can be obtained from local electrical dealers and contractors who will be glad to display equipment and discuss cost of house wiring and appliances, and from the County Agents, Home Agents, and others who can discuss the uses and applications of electric service at their regular meetings or classes. A two-reel TVA moving picture on "Electricity on the Farm" is now available for such meetings and other material may also be obtained on request.

Sheet 4

RURAL ELECTRIFICATION SURVEY

Neighborhood Plan

Canvasser's Mileage Sheet

This sheet is to be filled out by each Canvasser while he is travelling his route. This must be done to assist the engineers in laying out the line for construction.

How to Proceed: Start at bottom of the sheet and work up. Enter speedometer reading for "Starting Point" in Column 4. Then enter every home, giving mileage in Column 4, and posting name of resident to right or left, according to their location along the road. List all residents, but enter Application Numbers only for those who have actually signed Sheet 3. For each resident indicate the approximate distance from the center of the road in yards.

Yds. from Road	App. No.	Customers on LEFT (List signers & non-signers)	Speedometer Reading	Customers on RIGHT (List signers & non-signers)	App. No.	Yds. from Road

Customer's Notice Form

After the Customer's Application Agreements (Sheet 3) have been received and tabulated on the Summary Sheet (Sheet 5) the TVA representative will then be able to advise you whether or not the project can be approved for construction. If approved, (see form below) notice should then be sent to all customers advising them of this decision and instructing them to complete valid contracts for wiring and the purchase of appliances, as agreed upon.

If desired, standard contract forms may be obtained from the TVA, or electrical dealers may use their own forms. In any event, however, the contracts should contain the following provision: "This contract is conditioned on the availability of electric service at my premises at _____ and I shall be under no obligation for wiring or the purchase of appliances unless and until such service becomes available."

Following is the suggested notice to be sent to customers after the Committee has finished its survey and completed negotiations for financing and constructing of lines:

_____, Tenn. _____, 193

Dear Sir:

We note with very much interest your willingness to cooperate with the _____ County Power Association and your neighbors in the extension of rural power lines in _____ County. We have checked your petition and are pleased to advise that this line will be constructed when you and the other residents in this district complete contracts for house wiring and appliances as mentioned in your agreement of _____, 193____.

FOR AND IN CONSIDERATION of the mutual advantage to be derived from the construction of a Rural Distribution Line, and other good and valuable considerations, receipt of which is hereby acknowledged, the undersigned, _____ _____ _____ hereby grant unto the _____ a permanent easement and right of way through my or our property for the purpose of entering, erecting, maintaining, and operating a Rural Distribution Line, including all other distribution structures upon, under, across the following described land, lying in the _____ Civil District, _____ County, _____, more particularly described as follows to-wit:

TO HAVE AND TO HOLD the said easement and right of way to the said _____, its successors and assigns.

IN WITNESS OF all of which _____ have hereunto subscribed _____ name on this the _____ day of _____, 193___,

_____

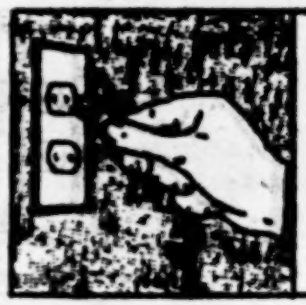
_____

STATE OF _____)
) ss:
COUNTY OF _____)

Personally appeared before me, _____ a Notary Public, in and for said County and State, _____ the within named bargainer___, with whom I am personally acquainted and

or $15.00 to the cost of three-wire service as soon as the range or water heater is actually installed. Thus, if you are planning a range or water heater, it will be cheaper to start off with three-wire service.

5. Wiring must conform to the standards and specifications of the National Board of Fire Underwriters, or such equivalent standards as may be set by your Municipality or Association. The service entrance, or place where the wires enter the house, must be made according to TVA specifications, available from your Municipality or Association.



When you wire, have plenty of these "convenience outlets" for your appliances.

* * * * *

Finance Plans:

In planning your house wiring and purchase of equipment, you can be greatly assisted by the finance plans which help you pay off this expense in small amounts over a period of years. In some cases these payments are made monthly, in others seasonally at the time of your crop returns.

Your local Committee or County Agent can give full details about the finance plans which are available in your community. Principal agencies are as follows:

1. Electric Home and Farm Authority (EHFA). This agency has approved a number of electric appliances for financing (FHA). In this case money may be borrowed from a local bank, like any other loan, except that terms and rates are more liberal than ever before. FHA loans, up to $2,000, may be obtained for all major electric equipment, and also to cover cost of wiring, plumbing, sinks, bathrooms, etc., and other modernization, such as built-in kitchen cabinets. There is no down payment (except on refrigerator, washing machine and ironer), loans may extend up to three years, and repayments may be made monthly or seasonally. See your local banker for details.

3. Production Credit Corporations. These are maintained in many areas and are often willing to assist in financing loans for wiring and equipment for farm users. Terms are generally similar to those for FHA. Full details may be obtained from the local County Agent or Farm Bureau.

4. Private Agencies. In addition to the above plans, there are a number of liberal finance plans maintained by private finance companies. Full details may be obtained from local dealers and mail order houses. However, customers should always check up to obtain the best terms and interest rates.

To see how these plans make it possible to spread out the cost of appliances, note the following examples, at EHFA rates:

Appliance	Cash Price	Minimum Down Payment	Minimum Monthly Payment
1. Refrigerator	$ 79.50	$3.50	$2.54
2. Range	74.50	3.50	2.38
3. Water Heater	60.00	3.00	2.27
4. Range and Refrigerator	154.00	5.00	3.83
5. All Three	214.00	6.00	5.30

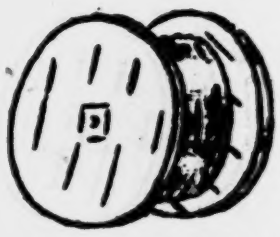
RURAL ELECTRIFICATION SURVEY

Neighborhood Plan

Information Sheet



Farm Uses of Electricity:

There are several hundred practical uses for electricity on the farm, and many of these will help to make money or save money on the farm. A few of the main farm and home uses are indicated below, with estimates of the amount of power they will use and approximate cost of equipment. These estimates, of course, represent averages only. The actual cost and operating expense will vary more or less depending on the size and type of equipment.

NAME OF EQUIPMENT	ENERGY CONSUMPTION	APPROXIMATE COST
Dairy Equipment		
Bottle Washer	1/3 KWH per 1,000 bottles	$7.50 to $60
Cream Separator	1/2 KWH per 1,000 lbs. milk	$50 to $150
Milking Machine	60 KWH per mo. per 25 cows	$30 up
Sterilizer	6 KWH per day per 25 cows	$150 up
Water Heater	10 KWH per day per 25 cows	$46.50 to $68.25*
Dairy Refrigeration	1 KWH per day per 10 gals.	$240 to $675
Churn	2 KWH per 100 lbs. milk	$20 to $75
Poultry Equipment		
Incubator	1/4 KWH per chick hatched	$10 up
Brooder	1/2 to 1 KWH per chick (season)	$6.50 up
Poultry Lights	20 KWH per year per 100 birds	$4.50 up per 100 birds
Meal and Feed		
Ensilage Cutter	1 KWH per ton	$50 to $400
Meal and Feed Grinder	1/2 KWH per bushel	$8 up
Sausage Grinder	1/2 KWH per 100 lbs. meat	$4 to $10
Hay Baler	2 KWH per ton	$300 to $600
Miscellaneous		
Large Meat Box Refrigerator	240 KWH per mo.	$400 to $1,000
Electric Hotbeds	1/2 to 1 KWH per day per sq.yd.	$10 to $20 per 6'x12' bed
Irrigation	2 KWH per acre inch per 10 ft. lift	$10 up per acre
Farm Motors	1 KWH per H.P. per hr.	$6 to $270
Household		

First	50 KWH	@ 3¢
Next	150 "	@ 2¢
Next	200 "	@ 1¢
Next	1000 "	@ 0.4¢
All over	1400 "	@ 0.75¢

Minimum residential bill is $0.75 per month and entitles the customer to use 25 KWH per month.

This rate is subject to an amortization charge of one cent (1¢) per KWH for the first 100 KWH used per month, such charge to be not less than $0.25 nor more than $1.00 per customer per month. This charge is kept separate and used to pay off the cost of the lines. When lines are paid for, the charge is eliminated.

churches, schools, grist mills, garages, tourist camps, hotels, signs, cold storage plants and small factories up to 10 h.p.

First	250 KWH	@ 3¢
Next	750 "	@ 2¢
Next	1000 "	@ 1¢
Excess over	2000 "	@ 0.8¢

Minimum commercial bill is $1.00 and entitles the customer to use 33 KWH per month.

This rate is subject to a developmental surcharge of 10% of net monthly bills, and to an amortization charge of one cent (1¢) per KWH for the first 100 KWH used per month, such charge to be not less than $0.25 nor more than $1.00 per customer per month.

Operating Costs:

Kilowatt hours are the unit of measure for electricity just as gallons are the unit for water or bushels are the unit for wheat. The table on page 1 shows about how many of these kilowatt-hour units are used by the different appliances. Table A above shows how much electricity costs per unit. With this information it is now easy for you to check off the equipment you want and figure just what will be the monthly operating cost of your equipment as shown in the examples below. In figuring the cost of power to you, be sure to compare the cost with what you are now spending in labor or cash for your present form of cooking, refrigeration, water pumping, etc.

HOW TO FIGURE OPERATING COSTS

Appliance	KWH Used Per Mo.	Electric Bill	Amortization Charge	Total
Lights and Small Appliances (Fan, Iron, Radio, etc.)	30 KWH	$ .90	$ .30	$1.20
Lights and Refrigerator	80 "	2.10	.80	2.90
Lights and Pump	80 "	2.10	.80	2.90
Lights, Refrigerator and Pump	130 "	3.10	1.00	4.10
Lights, Refrigerator, Pump, and Range	280 "	5.30	1.00	6.30
Lights, Refrigerator, Pump, Range and Water Heater	480 "	6.82	1.00	7.82

For further information, write
TVA, Division of Electrical Development, Old Post Office, Chattanooga, Tennessee

How The Survey Works:

This survey plan has been developed because it offers an easy, rapid way for farmers to survey their own rural electric lines and arrange for construction.

Due to various government agencies, it is now easier to develop rural electrification projects than ever before.

Through the Tennessee Valley Authority (TVA) or the Rural Electrification Administration (REA), your association or municipality can obtain funds for line construction without any financial liability to you either as a taxpayer or a customer.

Through other agencies (described on next page) it is possible to obtain loans for house wiring and the purchase of appliances on easier and more liberal terms than ever before.

But in spite of these great advantages, there still remain certain problems, and you must understand these thoroughly if your project is to be successful.

First of all, rural lines must be self-supporting. That means that each line must have a certain amount of business before the Government can afford to advance the money to build it.

The Government does not ask customers to put up large sums of money for line construction (that was the old method of rural electrification). It does not ask you to pay any heavy "line charges" or "monthly guarantees" or to assume any financial liability for the operation of the system.

On the other hand, it does ask you and your neighbors to see that there is enough business to make it possible for your line to pay its own way, gradually over a period of years.

liberal than any other plan previously developed. Instead of spending money for poles and transformers, the money you spend goes into labor-saving equipment for your own farm. If this equipment is selected wisely, it will, in many cases, help to make enough money, or save enough, to take care of the cost of electricity on the farm. This is especially true in view of the low TVA rates, and the low finance terms which now exist for the purchase of equipment.

Below will be found answers to some of the questions that will occur in planning for electric service on the farm.

* * * * * *

Cost of House Wiring:

If your home is already wired for Delco lights, the wiring will normally be satisfactory, requiring only the addition of a service entrance switch and connections, costing between $5.00 and $15.00.

If your home is not wired, this can be done by a reliable local electrician. In addition to the entrance switch ($5.00 to $15.00), wiring usually costs $2.00 to $3.00 per outlet. (Each switch, convenience outlet, or light receptacle counts as one outlet.) In planning your wiring remember these points:

1. Specify adequate wire to supply your equipment. (No wire lighter than #12 gauge for 110 volt circuits.)
2. Provide enough convenience outlets or wall plugs for all the equipment you will want to use.
3. Avoid "drop cords" and unshaded light bulbs which cause

Authority (TVA) or the Rural Electrification Administration (REA), your association or municipality can obtain funds for line construction without any financial liability to you either as a taxpayer or a customer.

Through other agencies (described on next page) it is possible to obtain loans for house wiring and the purchase of appliances on easier and more liberal terms than ever before.

But in spite of these great advantages, there still remain certain problems, and you must understand these thoroughly if your project is to be successful.

First of all, rural lines must be self-supporting. That means that each line must have a certain amount of business before the Government can afford to advance the money to build it.

The Government does not ask customers to put up large sums of money for line construction (that was the old method of rural electrification). It does not ask you to pay any heavy "line charges" or "monthly guarantees" or to assume any financial liability for the operation of the system.

On the other hand, it does ask you and your neighbors to see that there is enough business to make it possible for your line to pay its own way, gradually over a period of years.

What is "enough business"? There is no ready-made answer. But as a general rule, other communities have found that it is practical to build rural lines at low TVA rates when the customers install enough equipment to use an average of 662 kilowatt hours per month per mile of line. Thus, if there were four customers, each would agree to install equipment which would use 165 kilowatt hours per month.

This is the customers' obligation under the plan, and authorities have agreed that it is more practical and rates, and the low finance terms which now exist for the purchase of equipment.

Below will be found answers to some of the questions that will occur in planning for electric service on the farm.

* * * * * *

Cost of House Wiring:

If your home is already wired for Delco lights, the wiring will normally be satisfactory, requiring only the addition of a service entrance switch and connections, costing between $5.00 and $15.00.

If your home is not wired, this can be done by a reliable local electrician. In addition to the entrance switch ($5.00 to $15.00), wiring usually costs $2.00 to $3.00 per outlet. (Each switch, convenience outlet, or light receptacle counts as one outlet.) In planning your wiring remember these points:

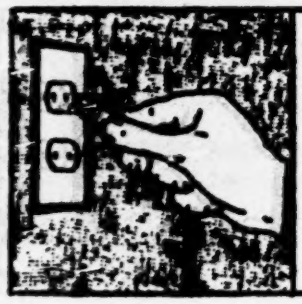
1. Specify adequate wire to supply your equipment. (No wire lighter than #12 gauge for 110 volt circuits.)

2. Provide enough convenience outlets or wall plugs for all the equipment you will want to use.

3. Avoid "drop cords" and unshaded light bulbs which cause glare and eye strain. Shaded lights are best. Inexpensive "kitchen units" are available with enclosed globe and a cord which combines a switch and outlet for your iron, percolator, etc., thereby eliminating wiring cost for a convenience outlet.

4. Consider right at the start the wisdom of installing "three-wire" service (suitable for range, water heater, air heater, etc.) rather than "two-wire" service (suitable for lights and small appliances only). Two-wire service entrances are a little cheaper. On the other hand, they give you less service. Also, in most cases, the local county power association makes a contribution of $15.00 to the cost of three-wire service as soon as the range or water heater is actually installed. Thus, if you are planning a range or water heater, it will be cheaper to start off with three-wire service.

5. Wiring must conform to the standards and specifications of the National Board of Fire Underwriters, or such equivalent standards as may be set by your Municipality or Association. The service entrance, or place where the wires enter the house, must be made according to TVA specifications, available from your Municipality or Association.



When you wire, have plenty of these "convenience outlets" for your appliances.

* * * * *

Finance Plans:

In planning your house wiring and purchase of equipment, you can be greatly assisted by the finance plans which help you pay off this expense in small amounts over a period of years. In some cases these payments are made monthly, in others seasonally at the time of your including: range, refrigerator, water heater, pump, motor, dairy cooler, cream separator, vacuum cleaner, washer, and kitchen heater. Models may be bought from approved local dealers with a small down payment, and small monthly payments on your electric bill, which may extend for as much as 48 months where two or more major items are purchased.

2. Federal Housing Administration (FHA). In this case money may be borrowed from a local bank, like any other loan, except that terms and rates are more liberal than ever before. FHA loans, up to $2,000, may be obtained for all major electric equipment, and also to cover cost of wiring, plumbing, sinks, bathrooms, etc., and other modernization, such as built-in kitchen cabinets. There is no down payment (except on refrigerator, washing machine and ironer), loans may extend up to three years, and repayments may be made monthly or seasonally. See your local banker for details.

3. Production Credit Corporations. These are maintained in many areas and are often willing to assist in financing loans for wiring and equipment for farm users. Terms are generally similar to those for FHA. Full details may be obtained from the local County Agent or Farm Bureau.

4. Private Agencies. In addition to the above plans, there are a number of liberal finance plans maintained by private finance companies. Full details may be obtained from local dealers and mail order houses. However, customers should always check up to obtain the best terms and interest rates.

To see how these plans make it possible to spread out the cost of appliances, note the following examples, at EHFA rates:

Appliance	Cash Price	Minimum Down Payment	Minimum Monthly Payment

TVA Rates:

All customers should be familiar with TVA rates schedules so that they can take full advantage of the economies offered.

Following are the schedules for Residential and Commercial Users:

Table A **RESIDENTIAL RATES**

	For Homes and Farms	
First	50 KWH	@ 3¢
Next	150 "	@ 2¢
Next	200 "	@ 1¢
Next	1000 "	@ 0.4¢
All over	1400 "	@ 0.75¢

Minimum residential bill is $0.75 per month and entitles the customer to use 25 KWH per month.

This rate is subject to an amortization charge of one cent (1¢) per KWH for the first 100 KWH used per month, such charge to be not less than $0.25 nor more than $1.00 per customer per month. This charge is kept separate and used to pay off the cost of the lines. When lines are paid for, the charge is eliminated.

Table B **COMMERCIAL RATES**

For all stores, filling stations, churches, schools, grist mills, dairies, tourist camps, hotels, signs, cold storage plants and small factories up to 10 h.p.

First	250 KWH	@ 3¢
Next	750 "	@ 2¢
Next	1000 "	@ 1¢
Excess over	2000 "	@ 0.8¢

Minimum commercial bill is $1.00 and entitles the customer to use 33 KWH per month.

This rate is subject to a developmental surcharge of 10% of net monthly bills, and to an amortization charge of one cent (1¢) per KWH for the first 100 KWH used per month, such charge to be not less than $0.25 nor more than $1.00 per customer per month.

Operating Costs:

Kilowatt hours are the unit of measure for electricity just as gallons are the unit for water or bushels are the unit for wheat. The table on page 1 shows about how many of these kilowatt-hour units are used by the different appliances. Table A above shows how much electricity costs per unit. With this information it is now easy for you to check off the equipment you want and figure just what will be the monthly operating cost of your equipment as shown in the examples below. In figuring the cost of power to you, be sure to compare the cost with what you are now spending in labor or cash for your present form of cooking, refrigeration, water pumping, etc.

[fol. 3999] COMPLAINANTS' EXHIBIT No. 922 FOR IDENTIFICATION

(Omitted)

[fol. 4000] COMPLAINANTS' EXHIBIT No. 923

Water Control Bulletin Number 1

June 30th, 1936

Reservoirs of the Authority are to be operated: First, to serve as navigation channels and maintain navigation depths in the reaches of the river below the reservoirs; and Second, to reduce the magnitude of flood peaks below. Requirements for the control of malaria and the temporary needs of construction shall be given due consideration. So far as consistent with the above procedure, as much water power available at the dams shall be converted into electricity as is feasible.

Water Control Operations

The Board of Directors on June 30, 1936, adopted Bulletin Number 1 and approved Bulletin Number 2, as recommended by the Hydro-electric Committee, and established the following procedure with reference to the preparation of subsequent bulletins and the administration of the requirements of these bulletins:

1. A committee on Water Control Operations is created consisting of the Chief Water Control Planning Engineer and the Chief Electrical Engineer. This Committee shall prepare general regulations as to the control of water through the operation of reservoirs. In formulating these regulations the Committee shall confer with the Chief Construction Engineer, the Chief Medical Officer, the General Solicitor and the Superintendent of Power Operations or their representatives. The regulations shall be transmitted to the office of the General Manager in the form of bulletins for submission to the Board of Directors and for general distribution after approval by the Board.

2. The Superintendent of Power Operations shall be responsible for the day to day operation of the gates within the limits of and consistent with the requirements estab-

lished by the regulatory bulletins of the Committee. He shall fix the responsibility for load dispatching and gate operation at each dam. On dams under construction a representative of the construction organization shall be designated to operate the gates.

3. The Engineering Data Division shall maintain current records of rainfall, runoff and river flow, furnish daily reports and predictions, and designate a representative who will maintain daily contact with the Chief Load Dispatcher at Wilson Dam for the exchange of information.

[fol. 4001] Water Control Bulletin Number 2

June 30, 1936

Confirming direction of June 18, 1936, which was responsive to recommendations for increasing navigable depths in the lower river, until further notice water shall be released from Norris Reservoir so as to maintain as nearly as may be a constant flow at Florence, Alabama, of 15,000 c. f. s.

Variations in the daily peek discharges at Wilson Dam should not be so large that minimum flow at the Florence gage will ever be less than 13,000 c. f. s. The regulation of the water level in the Wilson pool should be accomplished by varying the discharge at the Wheeler Dam. The water level above the Wheeler Dam should be varied so as to iron out, as far as possible, any fluctuations in the amount of water flowing into the Wheeler Reservoir.

Water Control Bulletin Number 3

October 24, 1936

The Committee on Water Control Operations, having conferred with the several departments and divisions of the Authority interested in or concerned with the filling of Wheeler Reservoir, and with the District Engineer, U. S. A., Nashville, Tennessee District, has formulated and hereby announces the following regulations for the filling of Wheeler Reservoir.

Wheeler Reservoir will be filled so as to reach elevation 540 at the dam by, but not before, midnight, October 28, 1936. This elevation will not be exceeded without further

notice from the Committee. As water becomes available during the next two months, after Wheeler Pool has filled to elevation 540 at the dam, the filling operation will be continued until normal pool level 555 has been reached. This filling operation between elevations 540 and 555, will be supervised by the Committee after due consideration of all factors involved in the best interest of the Authority.

Committee on Water Control Operations, Sherman M. Woodward, Chief Water Control Planning Engineer. Llewellyn Evans, Chief Electrical Engineer.

Approved by the Board of Directors, October 24, 1936.

[fol. 4002] Water Control Bulletin Number 4

March 10, 1937

The Committee on Water Control Operations has formulated the following general principles of control of Norris Reservoir for the spring runoff period of 1937 until April 1.

To provide the maximum amount of flood control, Norris Reservoir shall be drawn down to elevation 1010 by March 17, and then held approximately at that level until April 1. In case of heavy storms on the Tennessee water-shed, the outflow from the reservoir shall be controlled to limit the flow at Chattanooga to approximately 140,000 second feet, if possible. Storage accumulated above elevation 1010 by the withholding of flood flows shall be released as soon as possible at a rate not exceeding 30,000 second feet. Changes in rate of outflow shall be made in increments of not more than 5000 second feet every six hours.

Committee on Water Control Operations, Sherman M. Woodward, Chief Water Control Planning Engineer. Llewellyn Evans, Chief Electrical Engineer.

Approved by the Board of Directors, March 12, 1937.

Water Control Bulletin Number 5

April 1, 1937

The Committee on Water Control Operations has formulated the following general principles for the control of Norris Reservoir during April and May, 1937.

COMPLAINANTS' EXHIBIT No. 923

To provide the maximum quantity of water in Norris Reservoir for release during the summer and fall for navigation requirements on the Tennessee River below Florence, Alabama, Norris Reservoir shall be gradually filled during April and May to reach elevation 1020 by June 1. In case of heavy storms in the Tennessee Basin, the outflow shall be controlled to limit the flow at Chattanooga to approximately 140,000 second feet, if possible. Normally changes in rate of outflow shall be made in increments not [fol. 4003] exceeding 2,500 second feet so that the total change will not exceed 5,000 second feet in twelve hours. In special cases, changes may be made in increments of not more than 5,000 second feet in six hours.

Committee on Water Control Operations, Sherman M. Woodward, Chief Water Control Planning Engineer. Llewellyn Evans, Chief Electrical Engineer.

Approved by the Board of Directors, March 31, 1937.

Water Control Bulletin Number 6

April 1, 1937

The Committee on Water Control Operations has formulated the following general principles for the control of Wheeler and Wilson Reservoirs to May 1, 1937.

For malaria control purposes, Wheeler Reservoir shall be gradually filled to elevation 556 by April 10 and held approximately at that level until May 1. Wilson Reservoir shall be held at approximately elevation 505.8 until May 1. In case of heavy storms in the Tennessee Basin, these reservoirs shall be controlled to limit the flood flow at Florence to approximately 200,000 second feet, if possible. During this period of operation a discharge of not less than 20,000 second feet shall be maintained at Florence for navigation.

Committee on Water Control Operations, Sherman M. Woodward, Chief Water Control Planning Engineer. Llewellyn Evans, Chief Electrical Engineer.

Approved by the Board of Directors, March 31, 1937.

COMPLAINANTS' EXHIBIT No. 923

[fol. 4004] Water Control Bulletin Number 7.

April 30, 1937

The Committee on Water Control Operations has furmulated the following general principles for the control of Norris, Wheeler, and Wilson Reservoirs to October 1, 1937.

For Navigation purposes, water shall be released from Norris, Wheeler, and Wilson Reservoirs so as to maintain an average discharge of 17,000 second feet at Florence.

For malaria control purposes, Wheeler Reservoir shall be gradually drawn down, beginning May 1 *, from elevation 556 to elevation 553 by October 1 *. The rate of drawdown shall be about 0.3 ft. during May; about 0.8 ft. per month during June, July and August; and about 0.3 ft. during September. This schedule shall be subject to interruption when necessary, by regulation for floods, navigation, or construction operations; provided, upon completion of each such operation, the drawdown shall be resumed.

For malaria control purposes, Wilson Reservoir shall be drawn down about 0.6 ft. per month during June, July, and August, and 0.4 ft. during September, beginning at elevation 505.8.

Accompanying the drawdown, the reservoir shall be fluctuated weekly. The amount of the fluctuation shall be:

1. 1 ft. fluctuation for May, June, July, and August, provided the river flow is sufficient to refill the reservoir within the period.

2. During September the weekly fluctuation will gradually be reduced to reach 0.5 ft. by October 1.

For the protection of construction operations, in case of heavy storms, these reservoirs shall, if possible, be controlled as follows:

(a) The flood flow at Pickwick shall be limited to approximately 100,000 second feet.

---

* The initial and final days of the malaria season shall be determined by the time when water temperatures are favorable for breeding mosquitoes, on written advice from Dr. Bishop.

(b) The water surface of Wheeler Reservoir at Guntersville Dam shall be kept under elevation 560.

Committee on Water Control Operations, Sherman M. Woodward, Chief Water Control Planning Engineer. Llewellyn Evans, Chief Electrical Engineer.

[fol. 4005] Approved by the Board of Directors, May 5, 1937.

Water Control Bulletin Number 8

May 21, 1937

The Committee on Water Control Operations has formulated the following general principles for the control of Norris Reservoir until about October 1, 1937.

As soon as Norris Reservoir has been filled to elevation 1020, the water will be allowed to spill over the dam, provided that sufficient releases will be made to prevent the reservoir level exceeding elevation 1021.

For malaria control purposes, after June 15 the reservoir level will be gradually drawn down at a rate of not less than 0.6 foot per month, provided that in case it should be necessary in storing flood water to raise the level, the gradual drawdown will then be resumed.

When releases are required for maintaining navigation below Florence, Norris Reservoir will be controlled as provided in Water Control Bulletin Number 7, dated April 30, 1937. At other times a small release (in the order of 200 second feet) will be maintained throughout the low flow season for purposes of sanitation in the Clinch River.

In case of heavy storms in the Tennessee Basin, Norris outflow will be controlled to limit the flow at Chattanooga to approximately 55,000 second feet until about June 15 and thereafter to limit the stage at Guntersville Dam to elevation 560, if possible.

Committee on Water Control Operations, Sherman M. Woodward, Chief Water Control Planning Engineer. Llewellyn Evans, Chief Electrical Engineer.

Approved by the Board of Directors June 3, 1937.

COMPLAINANTS' EXHIBIT No. 923

[fol. 4006] Water Control Bulletin Number 9

June 28, 1937

The Committee on Water Control Operations has outlined the following special water control operation of Wheeler and Wilson Reservoirs.

In order to facilitate certain work at Wheeler Dam requiring lower stages in Wheeler and Wilson Reservoirs and to aid the construction forces in making closure of the third stage cofferdam at Pickwick Landing Dam, the following water control operation will be performed:

Beginning about July 1, Wheeler Reservoir shall be gradually drawn down so as to reach elevation 548 or 549 by July 17, Florence discharge during this period being regulated at not in excess of about 30,000 c. f. s. Wilson Reservoir shall also be drawn down to elevation 503 by July 17. The refilling of Wheeler and Wilson Reservoirs shall be done in such manner as to regulate the flow at Pickwick Landing Dam at not in excess of 8,000 c. f. s. beginning July 19 and continuing for an estimated period of from 7 to 10 days, or until the 3rd stage cofferdam closure has been completed.

Upon completion of this special operation, the operation of these reservoirs shall be resumed under Water Control Bulletin No. 7, dated April 30, 1937.

Committee on Water Control Operations, (S.) Sherman M. Woodward, Chief Water Control Planning Engineer. (S.) Llewellyn Evans, Chief Electrical Engineer.

Approved by the Board of Directors July 2, 1937.

[fol. 4007] COMPLAINANTS' EXHIBIT No. 924

Water Control Memorandum No. 1

The Health and Safety Department wants to have the Wheeler Pool raised to Elevation 551 as soon as convenient. To obtain this result we think that a uniform release from Norris of 6,000 c. f. s. may well be maintained and that as

soon as the Golden Eagle is out of the way the release at Wilson may be reduced slightly below 17,000 c. f. s., but not to less than about 16,200 c. f. s. As soon as the Wheeler Pool reaches the level of Elevation 551, the regular schedule of drawdown for malaria control should be resumed.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 2

The Health and Safety Department desires, for malaria control purposes, a somewhat rapid fluctuation of about 0.5 foot in Wheeler Reservoir as soon as practicable between the levels of about 551 and 551.5.

To conserve as much water as possible, this operation may be performed by reducing Norris release to about 4,000 c. f. s. on July 29; by saving water in Wheeler Reservoir during the drawdown fluctuation of Wilson Reservoir on August 3; and by drawing Wheeler Reservoir down by about 0.5 foot during the 3-day period, August 4, 5, and 6, after which the regular schedule of drawdown for Wheeler Reservoir may be resumed. About August 1, Norris release should be increased to about 6,000 c. f. s. in order to maintain the navigation release required at Florence.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 3

After an inspection of the Wheeler Reservoir area by the Health and Safety Department, it has been found desirable, for malaria control purposes, to draw Wheeler Reservoir down 1.0 foot to Elevation 550.3 as soon as practicable instead of 0.5 foot as stated in Water Control Memorandum No. 2, dated July 29, 1937.

To best serve the purpose, the drawdown should begin this date (August 3, 1937) and be completed as soon as practicable without adversely affecting Pickwick Landing Dam through excessive Wilson releases. This may be accomplished by extending the drawdown of one foot over a 3-day period, after which the regular schedule of drawdown stated in Water Control Bulletin No. 7 may be resumed.

(Signed) Robert A. Monroe for Sherman M. Woodward.

COMPLAINANTS' EXHIBIT No. 924

[fol. 4008] Water Control Memorandum No. 4

In view of the continued heavy rainfall over a considerable part of the basin, it appears advisable to make preparations for protecting Pickwick Dam in case a considerable flood should develop.

To avoid filling Wheeler Reservoir prematurely, and to provide additional storage space if possible, Wilson release should be increased to 30,000 c. f. s. as rapidly as the operation can be safely executed, and maintained at that release until a change becomes advisable.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 5

Indications are that Wheeler Reservoir inflows will decrease sufficiently within the next few days to warrant the reduction of Wilson Dam release to about 17,000 c. f. s.

The present 30,000 c. f. s. release at Wilson Dam, discussed in Water Control Memorandum No. 4, should be continued until Wheeler Reservoir is lowered to about elevation 549.6, after which the regular scheduled drawdown for malaria control stated in Water Control Bulletin No. 7 may be resumed, with such minor fluctuations as are desirable for operating purposes.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 6

Existing flows in the upper Tennessee River indicate that Wheeler inflows will require some regulation for the protection of Pickwick Landing construction.

Wilson releases should be regulated to pass about the flow of the river until Florence discharge reaches 25,000 c. f. s. This discharge should be continued until Wheeler Reservoir is again lowered to follow the scheduled drawdown from elevation 549.6 set forth in Water Control Bulletin No. 7, after which a minimum discharge of 17,000 c. f. s. may be maintained at Florence.

(Signed) Sherman M. Woodward.

[fol. 4009] Water Control Memorandum No. 7

The continuance of the wet season through much of the summer has resulted in abnormally low demands for water

releases for navigation from Norris Reservoir and consequently in a higher reservoir level at present than would normally prevail. It seems apparent that all water now stored in Norris from the last flood season will not be required for maintaining navigation on the Tennessee River during the remainder of the low flow period. It is believed desirable to draw the reservoir down to about elevation 980 by December 15, 1937 so that adequate storage space will be available during the next flood season.

In order to accomplish this purpose, the release from Norris Reservoir should be gradually increased to about 7,000 c. f. s. and maintained at that rate except in case of flood when it may be found necessary temporarily to reduce or discontinue the release. At present, regulated flows at Chickamauga Dam should not exceed 45,000 c. f. s.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 8

The Health and Safety Department is agreeable to discontinuing during the remaining few days in September the drawdown of Wheeler Pool for malaria control purposes, and to raising that pool to not higher than elevation 550.2 at the dam.

Conforming with the above, all water in excess of that needed for navigation below Florence (17,000 c. f. s. Florence discharge) may be stored in Wheeler Reservoir, provided the pool elevation at the dam is not raised above 550.2 for the present.

It is no longer necessary to regulate flows at Pickwick Landing Dam to 30,000 c. f. s. or less as construction operations will now permit flows up to 100,000 c. f. s. or more, if necessary.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 9

The Design Department and the Department of Operations report that it is necessary during the present month to make certain inspections, repairs, and tests of the turbines at Norris Dam and that at certain times during the progress of this work it will be necessary that Norris re- [fol. 4010] lease be discontinued or held at a very low rate.

In order that water may be available for maintaining a discharge at Florence of about 17,000 c. f. s. for navigation, it is essential that, in the absence of increased natural flows, water be released from Norris and stored in Wheeler Reservoir for this purpose.

To accomplish this purpose, the release from Norris Reservoir should be gradually increased, beginning at midnight Sunday, October 3, 1937, to about 15,000 c. f. s. and maintained at that rate until about 100,000 acre-feet have been stored in Wheeler Reservoir or until further notice. Meanwhile, if natural flows should increase sufficiently, Wheeler reservoir may be filled to, but not above, elevation 554. The exact date for reducing release for execution of the work at Norris will be determined later.

Temporary recorders have been installed at Clinton and Edgemoor for the purpose of obtaining data on wave travel. For this reason it is particularly desirable that the 15,000 c. f. s. release be held as steady as practicable during the first four days of the period.

(Signed) Sherman M. Woodward.

Water Control Memorandum No. 10

Confirming telephone conversation with the Chief System Operator, Wilson Dam, on October 3, 4, and 5, the release from Norris Reservoir will not be increased to about 15,000 c. f. s. as provided in Paragraph 3 of Water Control Memorandum No. 9, but instead will be reduced to about 4,000 c. f. s. and held steady at that rate until the weather becomes settled, or until further notice. This change was necessitated by the heavy rainfall over the Basin during the past few days subsequent to issuance of Water Control Memorandum No. 9.

The surplus water above 17,000 c. f. s. required for navigation at Florence may be temporarily stored in Wheeler Reservoir for subsequent release for navigation purposes when Norris release has been discontinued, provided that Wheeler Reservoir should not be filled above Elevation 554 until the present rebrushing operations in that reservoir have been completed.

The Director of Health has advised by memorandum that the fluctuation of Wilson Reservoir for malaria control

purposes may be discontinued upon completion of the present operation, October 7, 1937. Accordingly, this reservoir may be raised to Elevation 505.8 after that date.

(Signed) Sherman M. Woodward.

[fol. 4011] Water Control Memorandum No. 11

Referring to Water Control Memorandum No. 10, rainfall in the basin having subsided and the weather appearing more settled, the release from Norris Reservoir may now be gradually increased to a maximum of 15,000 c. f. s. in order to lower Norris Reservoir to a suitable elevation for certain inspections, repairs, and tests of the turbines at the dam during the last half of October. It is essential for the above work that Norris Reservoir elevation be between 991 and 1006.

In drawing Norris Reservoir down as above, releases should not be made which will raise the stage on the Chickamauga tailwater gage above elevation 637, which represents a discharge of about 50,000 c. f. s. In the event of heavy rainfall above Chattanooga, sufficient to produce a stage above 637, the release at Norris should be reduced promptly or discontinued if necessary to regulate the river at Chickamauga as above.

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

Water Control Memorandum No. 12

The Sanitation Section of the Health and Safety Department is continuing rebrushing operations in the Wheeler Reservoir until about October 15 and desires that the reservoir not be allowed to fill above elevation 553 before that date.

Norris Reservoir release should be gradually reduced to about 1500 c. f. s. by 6 A. M. October 11 to provide a tailwater elevation suitable for certain turbine inspections and repairs by the Operating Department. During the period that this work is in progress, it is desirable that releases be maintained at as large a volume as the work permits.

Tests on Norris turbines are planned to begin on October 18, and it is desired that the reservoir be between elevations 991 and 1006 for this purpose. During the period that tests

are in progress, such releases should be made as are consistent with and necessary for the turbine tests, provided that the changes and volumes of releases are not detrimental to other interests.

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

[fol. 4012] Water Control Memorandum No. 13

Tests on Norris turbines are planned to begin on October 19 and releases will probably be too small to provide 17,000 c. f. s. inflow into Wheeler. During this period the 17,000 c. f. s. discharge at Florence for navigation purposes should be maintained by releases from Wheeler and Wilson reservoirs when it is necessary to supplement the inflow.

As it is desired to lower Norris reservoir to about elevation 980 by December 15, 1937, to provide storage space for flood control and also to hold reservoir stages between elevations 991 and 1006 (preferably at about 1,000) for turbine tests, Norris releases should be maintained at as large a volume as the turbine tests permit, limiting releases to a maximum of about 10,000 c. f. s. in order to avoid excessive damage to crops on the Clinch River below the dam. At the same time, Chickamauga Dam lower gage should be held at not higher than elevation 637.

Norris turbine tests should be expedited as much as possible as higher Tennessee River flows may be expected at any time and special river regulation will shortly be necessary for construction, both of which will interfere with lowering Norris reservoir.

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

Water Control Memorandum No. 14

The Construction Department desires that, if practicable, flows at Pickwick Landing Dam be regulated so as not to exceed 25,000 c. f. s. during the period November 3 to November 23, 1937. This is essential in order that spillway openings in the dam may be closed. It also desires that, beginning about November 15, Wheeler Pool be filled to

elevation 555 or 556 to aid the third stage cofferdam closure at Guntersville Dam about December 1st.

In order to accomplish the above, Wheeler Reservoir should be gradually drawn down to elevation 550 by November 1 to provide storage space for regulating the flow at Pickwick Landing Dam. This will also facilitate certain construction work at Decatur. It is estimated that, under present flow conditions, a steady flow of about 33,000 c. f. s. at Florence will lower the reservoir to elevation 550 by the date desired. Changed flow conditions will require changes in Florence discharge.

About November 15, or as soon as the water control operation for Pickwick Landing Dam will permit, Wheeler Reservoir should be raised as fast as inflows will permit to about elevation 555 or 556 and then held steady during the closure of cofferdam at Guntersville.

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

[fol. 4013] Water Control Memorandum No. 15

Since the issuance of Water Control Memorandum No. 14, rainfall in the Tennessee Basin above Wheeler Reservoir has increased stream flow considerably. As a result of this, it appears desirable to provide additional storage space in Wheeler Reservoir for use in regulating flows at Pickwick Landing Dam during the closing of spillway openings in the dam between November 3 and November 23, 1937.

To accomplish this purpose, Wheeler Reservoir should be gradually drawn down to about elevation 549, one foot lower than previously proposed, by November 1st. It is estimated that under present flow conditions, a steady flow of about 55,000 c. f. s. at Florence will lower the reservoir as above. Changes in flow conditions will require corresponding changes in Florence discharge.

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

Water Control Memorandum No. 16

The correct date of Water Control Memorandum No. 15 is October 27, 1937, and not October 19, 1937, as shown on the copies distributed.

It is desirable to draw Norris Reservoir down to about elevation 960 by January 1, 1938, to provide storage space for flood control during the winter and spring flood season. To accomplish this, the release from the reservoir should be increased to about 15,000 c. f. s. and maintained at that rate except in case of flood, or other need for stream flow regulation downstream, when it may be essential temporarily to reduce or discontinue the release. Regulated flows at Chickamauga Dam should not exceed 637 on the down stream gage until the completion of work in the second stage cofferdam in the near future.

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

[fol. 4014] Water Control Memorandum No. 17

With the completion of spillway closures, Pickwick Landing Dam is in condition for stages to the top of the cofferdam at elevation 390. Flows at Pickwick Landing Dam should be regulated so as not to exceed 230,000 c. f. s.

The Construction Department desires that Wheeler Reservoir be raised to about elevation 555 or 556 and held steady during the closure of the third stage cofferdam at Guntersville Dam which should be completed about December 1. Wheeler Reservoir should be raised to about elevation 555 as fast as inflow in excess of 17,000 c. f. s. permits and held steady unless stream flows develop which require regulation for the protection of Pickwick Landing Dam. In case heavy rainfall occurs, Wheeler Reservoir should be lowered in advance of the peak flow to provide storage space for regulating the flow at Pickwick Landing Dam.

(Signed) Robert A. Monroe, for Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

Water Control Memorandum No. 18

As construction of the third stage cofferdam at Guntersville Dam is in progress, Wheeler Reservoir should be raised to about elevation 556 as fast as inflow permits and held

steady at that elevation unless stream flows develop which require regulation for the protection of Pickwick Landing Dam. In case that heavy rainfall occurs, Wheeler Reservoir should be lowered in advance of the flood peak to provide storage space for regulating the flow at Pickwick Landing Dam so as not to exceed 160,000 c. f. s.

Flow at Florence should be maintained at 19,000 c. f. s. between 7 a. m. and 4 p. m. on Wednesday, Friday, and Saturday of this week as an aid to dredging by the U. S. Engineers. At other hours the flow may be reduced to 17,000 c. f. s. Should inflows fall below 17,000 c. f. s., the deficiency should be supplied from Wilson Reservoir, holding Wheeler Reservoir steady at elevation 556.

In order to reduce stream flow as an aid to Guntersville Dam cofferdam closure, Norris release should be reduced, beginning about noon November 25, to about 2,000 c. f. s. Unless stream flow conditions require a change, it is contemplated that the 2,000 c. f. s. release will be held until about December 4, except as required for power production and plant testing. This reduction in release will also provide farmers on Clinch River bottomland and islands an opportunity to harvest crops.

(Signed) Robert A. Monroe, for Sherman M. Woodward.

Recommended (Signed) J. H. Wilkinson.

[fol. 4015] Water Control Memorandum No. 19

In order to provide water in excess of the present flow of the Tennessee River to raise Hales Bar Pool as an aid to navigation Norris release should be increased to 4,000 c. f. s. beginning about 5 p. m. Thursday, December 2, and continued at about that rate until enough water is released to fill the pool, after which the release should be reduced to about 2,000 c. f. s. except as required for power production and plant testing.

It is contemplated that Hales Bar Dam will continue to pass the present flow of the river and store the 2,000 c. f. s. increase in Norris release as arranged by Mr. C. L. Karr. The flow at Guntersville Dam should not exceed the present flow of the river during cofferdam closure.

Wheeler Reservoir should be held at about elevation 556 except in case of heavy rainfall. Should heavy rainfall occur, the reservoir should be lowered in advance of the flood peaks to provide storage space for regulating the flow at Pickwick Landing Dam so as not to exceed 160,000 c. f. s.

Flow at Florence should be maintained at a minimum of 17,000 c. f. s., supplying any deficiency in inflow from Wilson Reservoir.

(Signed) Robert A. Monroe, for Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

Water Control Memorandum No. 20

Referring to last paragraph of Water Control Memorandum No. 18, the Guntersville Dam cofferdam has now been closed and the drawdown of Norris Reservoir to elevation 960 to provide storage space for flood control should be resumed. Also, Wheeler Reservoir should be drawn down to elevation 550, in order to provide first, storage space for regulating flows for Pickwick Landing Dam construction operations, second, a suitable stage at Wheeler Lock to permit the U. S. Engineers to construct a concrete retaining wall, and third, additional depths below Wilson Dam to aid the U. S. Engineers in removing stone dikes before the Pickwick Pool is raised.

To accomplish the above, Norris release should be gradually increased, beginning today, to 15,000 c. f. s. and maintained at that rate until the reservoir is lowered to elevation 960, except in case of floods. Regulated flows at Chickamauga Dam should not exceed a maximum elevation of 640 on the tailwater gage (about 69,000 c. f. s.) and it is desirable that, if practicable, the flows at that point should be held below elevation 637 on the tailwater gage (about 50,000 c. f. s.).

[fol. 4016] Water Control Memorandum No. 20

Wheeler Reservoir should be lowered, beginning Monday, December 13, 1937, by gradually increasing the release to about 50,000 c. f. s. and maintaining that rate until the reservoir reaches elevation 550, after which the reservoir should

be held at elevation 550, passing the flow of the river, except in case of floods. In case of floods, Pickwick Landing Dam flows should be regulated so as not to exceed headwater elevation 390 (about 160,000 c. f. s.) until December 15. After December 15 flows at Pickwick Landing Dam should be regulated so as not to exceed tailwater elevation 372 (about 115,000 c. f. s.).

(Signed) Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

Water Control Memorandum No. 21

In view of the present unsettled weather conditions and the possibility of rain throughout the basin, it is desirable that the flood storage space above elevation 550 in Wheeler Reservoir be made available for the protection of Pickwick Landing Dam as soon as practicable.

To accomplish this the release at Wheeler Dam should be gradually increased to about 65,000 c. f. s. and maintained at about that rate until the reservoir reaches elevation 550, after which the reservoir should be held steady passing the flow of the river, except in case of floods. In case of floods, Pickwick Landing Dam flows should be regulated so as not to exceed tailwater elevation 372, at which the discharge is about 115,000 c. f. s.

(Signed) Robert A. Monroe, for Sherman M. Woodward.

Recommended (Signed) Nicholls W. Bowden.

[fol. 4017] Water Control Memorandum No. 22

In view of the present continued unsettled weather conditions, it is desirable that the flood storage space above elevation 547 in Wheeler Reservoir and above elevation 503 in Wilson Reservoir be made available for the protection of Pickwick Landing Dam as soon as practicable.

To accomplish the above, the release at Wheeler Dam should be gradually increased to about 66,000 c. f. s. and the release at Wilson Dam should be gradually increased to about 70,000 c. f. s. and maintained at about these rates until Wheeler Reservoir is lowered to elevation 547 and Wilson Reservoir is lowered to about elevation 503. After being

COMPLAINANTS' EXHIBIT No. 924

lowered to these elevations, both reservoirs should be held steady, passing the flow of the river, except in case of floods. In case of floods, Pickwick Landing Dam flows should be regulated so as not to exceed tail-water elevation 372, at which stage the discharge is about 115,000 c. f. s.

Beginning about 6 P. M. today Norris release should be gradually reduced to about 5000 c. f. s. After this reduction is accomplished, the release should be maintained at about 5000 c. f. s.

(Signed) Sherman M. Woodward.

Recommended (Signed) J. H. Wilkinson, for Nicholls W. Bowden.

Water Control Memorandum No. 23

The unsettled weather conditions indicate that rain may continue for several days. In order to lower Wheeler and Wilson Reservoirs, the discharge at Wheeler should be gradually increased to 75,000 c. f. s. and at Wilson to 80,000 c. f. s.

(Signed) Sherman M. Woodward.

Recommended (Signed) J. H. Wilkinson, for Nicholls W. Bowden.

[fol. 4018] Water Control Memorandum No. 24

The present releases at Wilson and Wheeler Dams should be continued until Wilson Reservoir is lowered to elevation 503 and Wheeler Reservoir is lowered to elevation 550. Both reservoirs should then be held steady except in case of floods requiring regulation.

(Signed) Sherman M. Woodward.

Recommended (Signed) J. H. Wilkinson.

[fol. 4022] COMPLAINANTS' EXHIBIT 928

Power Contract Between Tennessee Valley Authority and City of Florence, Alabama

This Agreement, made and entered into this 12th day of March, 1934, pursuant to the Tennessee Valley Authority Act of 1933, between the Tennessee Valley Authority, hereinafter called "Authority", a corporation created by and acting under said Act, and the City of Florence, a municipal corporation duly organized, created and existing under and by virtue of the laws of the State of Alabama, hereinafter called "Contractor",

Whereas Authority, by Section 10 of said Act, is authorized to sell the surplus power generated by it and not used in its operation, and is directed to give preference to States, Counties, Municipalities and cooperative organizations of citizens or farmers not organized or doing business for profit; and

Whereas, by Section 11 of said Act it is provided that the sale of power by Authority shall be primarily for the benefit of the people of the section as a whole and particularly the domestic and rural consumers to whom the power can economically be made available; and

Whereas, the electors of the Contractor have by referendum authorized Contractor to acquire by construction or purchase a municipal electric distribution system, and Contractor intends, with all possible diligence and expedition, to acquire by construction or purchase and to operate such a system; and

Whereas, Contractor desires to purchase power from Authority for municipal purposes and for resale and proposes to make the necessary appropriations in payment therefor; and

[fol. 4023] Whereas, Contractor has by ordinance of its council duly authorized the making of this contract, and Authority, by its by-laws and resolutions, has likewise so authorized;

Now Therefore, for and in consideration of the mutual covenants herein contained, the parties hereto mutually covenant and agree as follows:

1. Term of Contract.—This contract shall become effective upon the execution hereof, and shall continue in effect for thirty years; Provided, however, that all obligations of

the parties hereto with regard to the rendition of service and payment therefor shall begin at such time (hereinafter designated "date of initial delivery") as Contractor shall have acquired its distribution system, or any part thereof, and shall be in physical position to take such service for its said system or part thereof. All service and payment periods hereinafter referred to shall be computed (as) from the date of initial delivery.

2. Acquisition of Plant.—Contractor agrees to use all reasonable diligence in acquiring by construction or purchase a municipal distribution system for the City of Florence with the utmost expedition, and to do all acts and things which it may legally do, which may be necessary or helpful in effectuating such acquisition. Authority agrees, upon request of Contractor, to render to Contractor without compensation such accounting, legal and engineering assistance looking to the acquisition of said system as Authority may deem helpful or advisable.

3. Power Supply.—Authority will, from the date of initial delivery to the expiration hereof, supply electrical energy to Contractor for municipal purposes and for re-sale. Contractor agrees to purchase from Authority, and Authority agrees to supply, the entire power requirements of Con- [fol. 4024] tractor. Said energy will be delivered in the form of three phase, alternating current at approximately 60 cycles per second and approximately 4,000 volts, or at such voltage as the parties may from time agree. The maximum amount of electricity (called "reserve power"), which Authority agrees to supply within the first two year period is 7,500 kw., but thereafter Contractor shall have the right to increase such maximum demand as herein specified, and Authority shall deliver the same to Contractor. After two years from the date of initial delivery, as Contractor foresees the necessity for more than 7,500 kw. Contractor shall make written demand upon Authority for an increase of reserve power. Such increase shall take effect nine months after date of demand if the amount demanded be less than 5,000 kw. twelve months after date of demand if the amount demanded be over 5,000 kw., and not over 10,000 kw., and two years after date of demand if the amount demanded be in excess of 10,000 kw.

4. Conditions of Use and Service.—(a) Point of Delivery: The energy to be supplied Contractor hereunder shall be delivered at the outgoing side of main switch or switches on the low tension side of the main step-down transformers of the substation to be owned and operated by the Authority, and to be located on Lot 170 in the City of Florence, Lauderdale County, Alabama, said lot fronting on Sweetwater and Chestnut Streeets in said City, or at such other point as Authority may select which will not occasion greater costs to Contractor.

(b) Grant of Franchise to Authority.—Contractor agrees to grant Authority a franchise, extending to the date of termination of this contract, in a form acceptable to Authority, for the use of the streets and alleys of Contractor for the construction of poles and lines serving Contractor's substation or substations and/or areas outside the corporate limits of Contractor.

[fol. 4025] (c) Joint Use of Poles.—Authority agrees to permit Contractor, subject to such reasonable conditions as Authority may prescribe in the interest of safety and the prevention of electrical interference, to permit Contractor to use Authority's poles within Contractor's corporate limits, within the terms of this contract, for local distribution wires.

(d) Use of Substation Facilities.—Authority agrees, during the term of this contract, to permit Contractor the exclusive use of the 2300 volt portion of the Florence Central Substation, beginning at the load side of Authority's metering apparatus, located on Lot 170 in the City of Florence, together with all equipment and appurtenances. Contractor undertakes, at its own expense, to operate, maintain and repair, and to extend or alter as the situation may require, such substation facilities as are granted for the use of Contractor, and to save Authority harmless with respect thereto. Contractor shall be responsible for any damage to such facilities from any cause whatsoever. Contractor agrees to pay Authority for such use the sum of Twelve Thousand ($12,000) Dollars, at the rate of Two Hundred ($200) Dollars monthly beginning two years after the date of initial delivery. All facilities which Contractor

may install shall be considered personalty and at the expiration of this contract, Contractor may remove all facilities which it has purchased and installed without expense to Authority.

Authority will from time to time as it contemplates a change in the physical characteristics of the supply system, notify Contractor of the resulting short-circuit characteristics, so that Contractor may govern its use of the aforesaid equipment accordingly. It is understood and agreed that Authority has an option to purchase said Florence Central Substation, and that the covenants of this sub-article are conditioned on the exercise of such option. The obli- [fol. 4026] gation of this Subsection shall not bind the general credit or revenue of Contractor but is payable only from revenues of Contractor's electric system. In event of default in Contractor's obligations hereunder Authority may by written notice terminate Contractor's right to the use of the substation facilities above described and Authority may retain all payments theretofore made for such use as liquidated damages.

5. Schedule of Rates.—Attached hereto, and hereby made a part hereof by reference, the same as though physically incorporated herein, is a "Schedule of Rates and Charges". Contractor agrees to pay for the energy supplied by Authority at the rates fixed in Schedule A, entitled "Tennessee Valley Authority Wholesale Power Rates".

6. Resale Rates.—In order to carry out the obligations of Authority with respect to the promotion of a wider use of electricity throughout the area in which it operates, Contractor agrees to charge all of its consumers the rates prescribed for the several classes of consumers in Schedule B, entitled "Tennessee Valley Authority Resale Rates", and not to depart therefrom except with the written consent of Authority, Authority may from time to time prescribe additional resale schedules for special classes of customers or special uses of electricity, and Contractor agrees to be bound thereby. If it should appear that the rates provided for in said schedule with the surcharges provided for therein do not under economical and efficient management by Contractor produce revenues sufficient to maintain the system on a self-supporting and financially sound basis, then upon

application by Contractor, Authority shall consent to such changes in rates as will provide for such increased revenues as will place the system upon a self-supporting and financially sound basis when operated under economical and efficient management.

[fol. 4027] 7. Rules and Regulations of Authority.—Attached hereto, and hereby made a part hereof by reference, the same as though physically incorporated herein, is a schedule entitled "Schedule of Rules and Regulations", and it is understood that the several provisions of said schedule, as well as the several provisions of this contract and of the Schedule of Rates and Charges, are of the essence of this contract, and that their violation by Contractor renders this contract voidable at the option of Authority, unless such violations are cured upon reasonable notice.

The Schedule of Rules and Regulations is standard and of uniform applicability to all municipal customers of Authority, and the Contractor hereby agrees to be bound during the term hereof, by any future additions or amendments of such Schedule of Rules and Regulations prescribed after conference with representatives of Contractor, the same as though such additions or amendments were incorporated herein. If there should be any conflict between any Rules or Regulations prescribed pursuant to this and the following article, and the terms of this contract, the contract shall control.

8. Rules and Regulations of Contractor.—In the interest of uniformity, and for the protection of both Contractor and Authority, Contractor agrees to adopt and enforce such rules and regulations for the sale of electricity to the public as Authority may, after conference with representatives of Contractor, from time to time prescribe during the term of this contract for uniform application to all of the municipal customers of Authority deemed to have similar characteristics.

9. Declaration of Policy.—This contract is entered into in a spirit of cooperation and with the desire on the part of Authority and Contractor so to administer the relationship established by this contract as to operate to the benefit of Contractor and its residents and of the residents of the

COMPLAINANTS' EXHIBIT 928

[fol. 4028] Tennessee Valley. In furtherance of this cooperative relationship Authority will, by every means within its power, seek to further the economic welfare of Contractor by fostering and promoting the increased use of electricity within Contractor's corporate limits, and by such other means as are provided by law. Contractor agrees to cooperate with Authority in such program within Contractor's area of operation and to work with Authority in furthering the economic well-being of the entire Tennessee Valley. This contract shall be construed and administered in accordance with this statement of policy.

10. Contract Not Transferable.—Neither this contract nor any interest therein shall be transferable or assignable by Contractor to any other party without the consent of Authority, other than by involuntary transfer or assignment pursuant to proceedings brought by a governmental agency to enforce the payment or satisfaction of an indebtedness arising out of money borrowed by Contractor to finance the purchase or construction of its electric distribution plant and/or equipment.

In Witness Whereof, the parties hereto have caused this instrument to be signed and attested by their duly authorized officers, the day and year first above written.

Tennessee Valley Authority, by Arthur Morgan, Chairman, Board of Directors. (Swidler.)

Attest: C. A. Bock, Secretary (Acting).

City of Florence, by Lee Glenn, President of the Board of Commissioners, and ex officio Mayor.

Attest: S. B. Howard, City Clerk.

Approved as to form and correctness, as adopted by the Commission of the City of Florence, Ala.

W. H. Mitchell, City Attorney.

ing, legal and engineering assistance looking to the acquisition of said system as Authority may deem helpful or advisable."

3. The maximum amount of electricity which TVA agrees to supply within the first two year period is 4500 kw.

4. The point of delivery shall be at a point to be designated by TVA at or near the western boundary of Nitrate Plant No. 2.

[fol. 4031] COMPLAINANTS' EXHIBIT No. 931

Subpoena Duces Tecum

The President of the United States to Tennessee Valley Authority, Greeting:

You are hereby commanded to appear before the District Court for the Eastern District of Tennessee, Northern Division, in the courtroom of the Federal Building at Chattanooga, Tennessee, on the — day of ——, 1937, at — o'clock A. M., and bring with you the following, to wit:

Copy of report of United States Department of the Interior, Bureau of Reclamation, entitled "Economic Height of Norris Dam" by E. B. Debler, Hydraulic Engineer, dated November 1, 1933,

and fail not under penalty of law.

Witness the Honorable Judge of the United States District Court for the Eastern District of Tennessee, this — day of ——, 1937.

—— ——, Clerk, by —— ——.

Let this writ issue. —— ——, Presiding Judge.

(Here follows one photolithograph, side folio 4032)

COMPLAINANTS' EXHIBIT NO. 932

COMPARATIVE LOCKAGE TIMES PER LOCK
(No allowance for Open River Navigation)

Based partly on witness Barker's total time for single passage through low lift lock of 31 minutes and through high lift lock of 39 minutes. (Transcript 4669).

A tow consisting of 8 barges and 1 towboat is assumed. To carry 250 to 300 carloads (Transcript 3311) the barges would approximate 175' long by 26' wide, carrying about 800 tons each or a total of 6,400 tons. Four of these barges can enter a lock 60' x 360' at one time as their outside dimensions will be 52' x 350'. In locking, four barges could go through in the first section, four in the second, and the towboat in the third. With a lock 110' x 600', the entire fleet could go through in one operation, as the outside dimensions would not be over 92' x 525'.

[fol. 4041] COMPLAINANTS' EXHIBIT No. 938 (Excluded)

June 2, 1932.

Memorandum Covering Proposed Electric Service to Elora, Tennessee, Flintville, Tennessee, U. S. Fish Hatchery in Warren Hollow, Kelso, Tennessee

Property of J. J. Moyers on New Highway #15 (Near Fayetteville), Property of Tom Bagley on New Highway #15 (Near Fayetteville)

A considerable amount of investigation and preliminary work has been done in connection with proposed electric service to Elora from Huntland and since this subject has been under discussion for a period of one and one-half years, it might be well to review the matter from the beginning.

History:

In December 1930 two estimates were prepared covering the construction of 6.3 miles of 11,000 volt line from Huntland to Elora with a distribution system for approximately 74 customers in Elora. One estimate, amounting to $10,270, covered a single phase line with distribution and the other, amounting to $13,930, covered a three phase line with distribution. The reason for two estimates being, that if the cotton gin load could be secured in Elora, a three phase line would be needed. In March 1931 the above estimates were revised in detail with resulting amounts of $11,130 and $14,050 respectively.

In July 1931 it was thought that possibly Elora might be served to better advantage by a line out of Fayetteville inasmuch as the communities of Kelso and Flintville could be served along the way. A survey was then made and alignment plotted for a route from Fayetteville via new highway #15, Flintville and Elora to Huntland. Also plane table surveys were made of Kelso, Flintville and Elora. The attached sketch shows the relative location of these towns.

Sufficient revenue, however, could not be obtained to justify building extensions to these communities so the matter was dropped for the time being.

COMPLAINANTS' EXHIBIT No. 938 (Excluded)

In February of this year the question was again reopened due to a petition being received from parties at Fayetteville asking for electric service for the farmers along new highway #15, for the new U. S. Government Fish Hatchery in Warren Hollow and for the communities of Kelso and Flintville.

Correspondence following this petition indicates that one J. J. Moyers is taking the lead in the matter and inspection of the highway maps indicates that he together with Mr. Tom Bagley own over a mile frontage on new highway #15 about 3 miles out from Fayetteville. Since this is a new highway there are very few houses near it. Under date of February 24, 1932, Mr. Moyers wrote a letter to Hon. Ewin L. Davis at Washington about the matter, the closing paraagraph of which reads as follows:

[fol. 4042] "I am asking that for the benefit of the Fish Hatchery and the farmers from Fayetteville to Kelso along Route #15 that you use your influence with the Tennessee Power Company in the manner you see fit."

Under date of April 4, 1932, Mr. Moyers wrote Mr. Bunn, local manager at Fayetteville, again expressing his desire for electric service.

Present Status:

The writer has discussed the proposition of service to this territory with Messrs. Parks and Watson and their distribution engineers and has also gone over the whole matter in the field. It is believed that the following represents the combined views of all on the subject.

Considering the number of miles of line to be built, the character of load to be served and the relative small number of customers this territory is rather lean. For this reason no general comprehensive plan for service to this section is warranted at this time and any extensions should be made on an individual basis. Our views on the prospective loads are as follows:

Elora (74 Prospective Customers):

This town located 6.7 miles from Huntland and 18.7 miles from Fayetteville, along the surveyed route, is the best prospect in the entire section, nevertheless it would be hard

to justify an extension even to it at the present time. In December 1930 when the proposition was most active, a guaranteed revenue of about $81.00 per month was secured, the estimated construction cost at that time being $10,270. Using our most economical rural construction we could probably serve them today for aroung $8,000, which on the 2% minimum plan would call for a guaranteed revenue of $160.00 per month. Elora located near the Alabama line depends on cotton for her income and under present economic conditions it is doubtful that the residents would be able to guarantee twice the revenue they did in 1930. We expect to keep working on the proposition though and sooner or later it may materialize. The logical method of serving Elora is with 11 kv. from Huntland.

Flintville (54 Prospective Customers):

Service to this town which is located about half way between Huntland and Fayetteville depends on our making the extension from Huntland to Elora. We could then build up the highway at 11 kv. from Elora and serve Flintville at about the same guarantee per customer as required in Elora.

U. S. Government Fish Hatchery:

Correspondence with Mr. Henry O'Malley, U. S. Commissioner of Fisheries indicates that their requirements will be relatively small. A copy of his letter to Mr. Shultz on the matter is attached. The cost of serving this load at present with a special line would be prohibitive. In the event, however, that we should get service into Flintville it might be possible to work out a satisfactory proposition with the Fish Hatchery at that time.

[fol. 4043] Kelso (20 Prospective Customers):

Kelso with 20 prospective customers could be most economically served from the end of the Joe Smith line, however, in view of the future possibilities along highway #15 from Fayetteville it might be more practical to use the latter route though longer. A minimum of $3500 would be required to serve Kelso which on the 2% plan would amount to a guarantee of $70.00 per month of $3.50 per customer. It

would not be possible to secure such a guarantee at this time.

J. J. Moyer & Tom Bagley Property:

These properties could be most economically served by an extension down new highway #15 which would tap off of the present Fayetteville-Mulberry line. As shown the Fish Hatchery and load would have little bearing on reducing the cost of the extension desired by Mr. Moyer. If these gentlemen with their neighboring property owners can secure sufficient guarantee to cover the construction of 3.2 miles of 2300 volt line it would be an easy matter to serve them.

In this event we might be able to extend the line on down to Kelso which would be about the limit for 2300 volt transmission.

Conclusions:

1. The prospects of securing profitable business in this territory at the present time are not very good but we expect to keep on working on it.

2. Elora is the best prospect of all and the Cumberland District will continue their efforts to serve them.

3. Service to the Fish Hatchery without special financial arrangements is prohibitive until service is made available at Flintville.

4. Service to properties of Messrs. J. J. Moyers and Tom Bagley depends on their ability to finance the proposition and the fact that Kelso and the Fish Hatchery are potential customers does not make proposed service to their properties any more attractive.

5. If Messrs. Moyer and Bagley feel that a proposition could be worked out with them and the farmers along Route #15 whereby they would guarantee sufficient revenue to construct a line we will be glad to work with them and prepare estimates to serve such customers as are interested. Our survey made in July 1931 shows no houses along new highway #15 between Fayetteville and Kelso a distance of nearly 6 miles. The properties of Messrs. Moyers and Bagley are located in this section.

[fol. 4045] COMPLAINANTS' EXHIBIT No. 939 (Excluded)

Letterhead of Railroad and Public Utilities Commission of the State of Tennessee

November 10, 1932.

Mr. Joe C. Guild, Jr., V. P. & Gen. Mgr., The Tennessee Electric Power Company, Chattanooga, Tennessee.

DEAR MR. GUILD:

I am enclosing copy of report made by Mr. Beatty, Assistant Engineer of the Commission, relative to estimated cost of proposed extensions at Mulberry and Fayetteville, Tennessee.

I understand that the Company has made an investigation of the proposed extensions and refer you to your letter of September 2, 1932 addressed to Mr. John B. Southall, Supt. of Construction for the Government Bureau of Fisheries, Fayetteville, Tennessee. We wish that you would have this extension investigated again and take up with Mr. Moyers of Fayetteville the requirements necessary to secure the extension. You will find in Mr. Beatty's report to me his estimate of the cost of making the necessary installation to render the service. We trust that sufficient business may be secured to justify this extension.

Yours very truly, (Signed) Malcolm R. Williams, Engineer.

MRW/b.

[fol. 4046] Letterhead of Railroad and Public Utilities Commission of the State of Tennessee

Memphis, Tennessee,
September 27, 1932.

Mr. M. R. Williams, Engineer, Railroad and Public Utilities Commission, Nashville, Tennessee.

Rural Extension, Fayetteville, Tennessee

DEAR MR. WILLIAMS:

In accordance with your instructions, I was in Fayetteville on the 16th and accompanied by Mr. Moyers of that

City, Mr. Southall with the Gov. Bureau of Fisheries and Mr. Bunn of the Tennessee Electric Power Co. made investigations regarding the feasibility of extending the Power Company's lines East on Highway #15 approximately 12 miles to serve the Fish Hatchery and also the towns, Kelso and Flintville, along the way.

It is my understanding that the Power Company's Engineers have made some previous estimate for the building od a 11000 volt line through Kelso to the Hatchery but not including Flintville. My estimate is based on extending a single phase 2300 volt line from a point approx. two miles East of Fayetteville, known as Renegar Station, through Kelso to the Gov. Hatchery and also a tap off this line approx. two miles in length to reach Flintville. This estimate covers complete cost of distribution systems in both Flintville and Kelso and amounts to a total of $11,689.84 made up as follows:

to and including Kelso	$4,527.92
add to include Flintville	5,424.53
" " " Gov. Hatchery	1,737.39
making a total of	$11,689.84

The attached sheets will show what the Proposed Subscribers have signified thier willingness to pay. You will note Kelso has subscribed $83.00, Flintville, though there are some errors in th-r set up $72.50 and it is my understanding the Hatcheries will use about $30.00 worth of energy making a total of $185.50 which, on the 2% basis, falls short of the required amount by approximately $50.00.

I was informed, while in Fayetteville, that the Power Co. proposes to make further investigation regarding this matter and it may be that the probable future business will be sufficient to justify.

Respectfully submitted, Charlie Beatty, Assistant Engineer.

[fol. 4047] COMPLAINANTS' EXHIBIT No. 940 (Excluded)

Memorandum as to the Feasibility of Extending a 2300 Volt Single Phase Line from Fayetteville to Serve the Communities of Kelso, Flintville and the U. S. Government Fish Hatchery

1. As shown on the attached sketch it is approximately 13.3 miles from the Fayetteville substation to Flintville along a practical distribution line route.

2. 2300 volt single phase transmission for this distance is considered very uneconomical and impractical by distribution engineers.

3. With a single phase #4 copper 2300 volt line, calculations show that with the present load at Mulberry and estimated loads taken on at Kelso, Flintville and Fish Hatchery a regulation of 30% and a voltage of 94 would result at Flintville. This type of service would be useless.

4. With a single phase #4 copper 2300 volt line extended to Flintville and with estimated loads taken on at Kelso and the Fish Hatchery, it would only be possible to deliver 2 Kva. to Flintville with a satisfactory voltage regulation (11.4%). This would mean that one small electric stove would load the line to capacity.

5. The economical voltage to supply this load is 11,000 volts. This voltage is not now available at Fayetteville and the cost of the necessary substation changes together with the cost of an 11 kv. line would make the extension to Flintville prohibitive.

The sketch is the same as that contained in Complainants' Exhibit No. 938.

[fol. 4051] COMPLAINANTS' EXHIBIT No. 943

The Charter of Incorporation of Lee County Electric Power Association

1. The corporate title of said company is: Lee County Electric Power Association.

2. The names of the incorporators are: Gene Watson, Postoffice, Guntown, Miss.; S. P. Evans, Postoffice, Tupelo, Miss.; J. C. Partlow, Postoffice, Plantersville, Miss.; Keith

Barnett, Postoffice, Shannon, Miss.; Lee Riley, Postoffice, Saltillo, Miss.; A. L. Burdine, Postoffice, Verona, Miss; Byron Long, Postoffice, Tupelo, Miss.; G. W. Ruff, Tupelo, Miss.; A. L. Gregory, Saltillo, Miss.; N. B. Buchanan, Tupelo, Miss.; J. G. Underwood, Guntown.

3. The domicile is at Tupelo, Mississippi.

4. Amount of capital stock and particulars as to class or classes thereof: This corporation is organized without capital stock and is to issue no shares and is not to engage in business for profit, but shall function as a civic improvement company or association.

This corporation shall not be required to make publication of its charter, shall issue no shares of stock, and shall divide no dividend or profit among its members. Expulsion shall be the only remedy for non-payment of dues and each member shall have the right to one vote in the election of all officers. The loss of membership by death or otherwise terminates all interest of such member in the corporate assets, and there shall be no individual liability against members for corporate debts, but the entire corporate property shall be liable for claims of creditors.

5. Number of shares for each class and par value thereof: None.

6. The period of existence (not to exceed fifty years) is Fifty years.

7. The purpose for which it is created: The purpose or object of this corporation shall be the following:

Section 1. To construct, purchase, add to, maintain, conduct and operate electric light and power distributing systems for the purpose of furnishing light and power service to the members of this corporation at cost and without profit.

Section 2. To acquire, erect, maintain and operate poles, wires, lines, conduits, transformers, lamps, motors, dynamos, and all other appurtenances necessary for distributing electricity for aforesaid purposes.

COMPLAINANTS' EXHIBIT No. 943

[fol. 4052] Section 3. To purchase such electricity from others for its own use and for the purpose of distributing the same to its members, only, at cost without profit.

Section 4. To acquire real or personal property, by purchase or otherwise, and to hold, sell, mortgage, or otherwise dispose of the same, to borrow money on bonds, notes or otherwise, for corporate uses, to acquire privileges and franchises, and to sell those now owned or hereinafter to be owned and generally to perform anything which may be necessary for the promotion of the objects hereinbefore stated.

Section 5. To apply for, and obtain, any franchise necessary for carrying out and making effective these Articles of Incorporation.

Section 6. To adopt by-laws, and to amend or repeal same.

Section 7. To promote the construction of electric power lines to the various communities of Lee County for the purpose of securing and distributing electric power from the Tennessee Valley Authority or others, to promote the use of electric power in every way possible and to cooperate with the Tennessee Vally Authority to this end.

The rights and powers that may be exercised by this corporation, in addition to the foregoing, are those conferred by Chapter 24, Code of Mississippi of 1906, and House Bill No. 655, Laws of Mississippi of 1928, and Chapter 100, Code of Mississippi of 1930.

8. Number of shares of each class to be subscribed and paid for before the corporation may begin business. None.

Byron Long, Tupelo, Miss.; Keith Barnett, Shannon, Miss.; S. P. Evans, Tupelo, Miss.; Gene Watson, Guntown, Miss.; A. L. Gregory, M. D., Saltillo, Miss.; Jno. G. Underwood, Guntown, Miss.; J. C. Partlow, Plantersville, Lee Riley, Saltillo, Miss.; Geo. W. Ruff, Tupelo, Miss.; A. L. Burdine, Verona, Miss.; N. B. Buchanan, Tupelo, Miss.; Incorporators.

COMPLAINANTS' EXHIBIT No. 943

Acknowledgment

STATE OF MISSISSIPPI,
County of Lee:

This day personally appeared before me, the undersigned authority Byron Long, Keith Barnett, S. P. Evans, Gene Watson, A. L. Gregory, M. D., Jno. G. Underwood, Joe Partlow, Lee Riley, Geo. W. Ruff, A. L. Burdine, N. B. Buchanan, incorporators of the corporation known as the Lee County Electric Power Association, who acknowledged that they signed and executed the above and foregoing articles of incorporation as their act and deed on this the 8th day of Jan., 1934.

G. W. Ballard, Ci. Clerk, by, Chas. Patrick, D. C.

[fol. 4053] Amendment to Charter of Incorporation of Lee County Electric Power Association

Under and by virtue of resolution passed by the stockholders, incorporators and members of the Lee County Electric Power Association of Tupelo, Lee County, Mississippi, on the 24th day of July, 1935, authorizing the same, the charter of incorporation of the Lee County Electric Power Association, which said corporation is domiciled at Tupelo in Lee County, Mississippi and which was incorporated on the 26th day of February, 1934, and the charter of which is recorded in book 33-34, pages 526 and 527 of the records of incorporations in the office of the Secretary of State, Jackson, Mississippi, is hereby amended so as to change the name of said corporation from that of "Lee County Electric Power Association" to "Tombigbee Electric Power Association."

Section seven (7) of said charter is amended to read as follows:

7. The purpose for which it is created:

The purpose or object of this organization shall be the following:

Section 1. To construct, purchase, add to, maintain, conduct and operate electric light and power distributing systems for the purpose of furnishing light and power service

to the members of this corporation at cost and without profit.

Section 2. To acquire, erect, maintain and operate poles, wires, lines, conduits, transformers, meters, lamps, motors, dynamoes, and all other appurtenances necessary for distributing electricity for aforesaid purpose.

Section 3. To purchase electricity and electrical appliances from others for its own use and for the purpose of distributing same to its members only at cost without profit.

Section 4. To acquire real or personal property by purchase or otherwise, and to hold, sell, mortgage, or otherwise dispose of the same, to borrow money on bonds, notes or otherwise, for corporate uses, to acquire privileges and franchises and to sell those now owned or hereafter to be owned and generally to perform anything which may be necessary for the promotion of the objects hereinbefore stated.

Section 5. To apply for, and obtain, any franchise necessary for carrying out and making effective these Articles of Incorporation.

Section 6. To adopt by-laws, and to amend or repeal same.

[fol. 4054] Section 7. To promote the construction of electric power lines to the various communities in Lee and Itawamba counties and vicinities for the purpose of securing and distributing electric power from the Tennessee Valley Authority or others and to promote the use of electric power in every possible way throughout the said area and to cooperate with the Tennessee Valley Authority to this end.

Keith Barnett, President. W. C. Inzer, Secretary.

STATE OF MISSISSIPPI,
County of Lee:

This day personally appeared before the undersigned Keith Barnett, President and W. C. Inzer, Secretary of the Corporation known as Lee County Electric Power Association, who acknowledged that they signed and executed the above and foregoing amendment to the charter of said corporation on the day and date therein set forth.

Witness my signature and seal this the 29th day of July, 1935.

W. H. Patton, Notary Public (Seal.)

84—Table showing dates of flood peaks at Johnsonville on the Tennessee River, Paducah on the Ohio River, and Cairo on the Mississippi River for past floods exceeding 50 feet at Cairo..... 4177 4098
85—Table showing Tennessee River flow at Gilbertsville Dam site, flood of January-February, 1937 ..... 4178 4098

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.

Defendants' Exhibits Nos.—Continued.	Original	Print
86—Chart showing effect of natural storage in Gilbertsville Reservoir area in the flood of 1937 (original exhibit) [omitted]	4179	4099
87—Chart entitled "Elimination of Dead Storage" (original exhibit) [omitted]	4179	4099
88—Diagram showing divisions of Ohio River drainage basin within which reservoirs have been built or considered (omitted)	4179	4099
89—Chart showing operation of suggested detaining basin system (original exhibit) [omitted]	4179	4099
90—Chart showing comparison between Norris reservoir and Cove Creek reservoir suggested by Fort Kurtz (original exhibit) [omitted]	4179	4099
91—Map entitled "Alluvial Valley of Lower Mississippi River" (original exhibit) [omitted]	4180	4099
92—Map entitled "Tennessee River Drainage Basin" (original exhibit) [omitted]	4180	4100
93—Chart showing profile of the Tennessee River in its natural unimproved condition (original exhibit) [omitted]	4180	4100
94—Table headed "Maximum and Minimum Rates of Stream Flow, Tennessee River"	4181	4100
95—Chart and table showing previous projects on the Tennessee River and its tributaries (original exhibit) [omitted]	4182	4100
96—Chart showing tons of freight moved on the Tennessee River from 1892 to 1936 (original exhibit) [omitted]	4182	4100
97—Chart entitled "Existing and Proposed Channel Depths before Tennessee Valley Authority Act" (original exhibit) [omitted]	4182	4101
98—Chart entitled "TVA Projects" (original exhibit) [omitted]	4182	4101
99—Photograph of boat passing through the Pickwick lock (original exhibit)	4182	4102
100—Photograph of Wheeler lock, with tow of cement barges in the lock (original exhibit)	4183	4104
101—Photograph of lower approach to Guntersville lock with N. C. & St. L. car ferry entering the lock (original exhibit)	4183	4106
102—Chart showing coal transfer and transit facilities of Norris Dam (original exhibit) [omitted]	4183	4107

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.
Defendants' Exhibits Nos.—Continued. Original Print
103—Chart showing coal transfer and transit facilities section and elevation through transit bin and non-overflow section, Norris Dam (original exhibit) [omitted] 4183 4108
104—Chart entitled "Comparison of High-Dam and Low-Dam Plans on Tennessee River" (original exhibit) [omitted]..... 4183 4108
105—Table showing time saved in Lockages with TVA high-dam plan as compared to a low-dam plan, assuming same size of locks in each plan..... 4184 4108
106—Graph entitled "Comparison of Velocities in High Dam and Low Dam Pools" (original exhibit) [omitted]..... 4185 4108
107—Graph showing relation of horsepower and depth (original exhibit) [omitted]..... 4185 4109
108—Table showing percentages of channel distances that are less than twenty feet in depth in the high-dam pools..... 4186 4109
109—Chart showing improvement on tributaries provided by the high-dam plan (original exhibit) [omitted] 4187 4109
110—Chart entitled "Comparison of Pool Fluctuations with High Dams and Low Dams" (original exhibit) [omitted].... 4187 4109
111—Letter dated September 1, 1934 from J. S. Bowman to the District Engineer requesting information concerning the locks which might be required by the War Department for the middle and upper stretches of the Tennessee River. 4188 4110
112—Letter dated September 19, 1934 from Major General E. M. Markham to Dr. A. E. Morgan in answer to Defendants' Exhibit 111..... 4189 4111
113—Chart showing Wheeler Reservoir and surrounding region (original exhibit).... 4194 4112
114—Mimeographed copy of circular issued by the War Department, U. S. Engineer Office, Nashville, Tennessee, December 7, 1936, attaching drawings showing normal limits of Wheeler reservoir and location of the channel which is marked for navigation 4192 4113
115—Table entitled "Theoretical Efficiencies of the Tennessee River Waterway"..... 4211 4133

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.
Defendants' Exhibits Nos.—Continued. Original Print
116—Chart showing Tennessee River and interconnecting waterways (original exhibit) [omitted] 4212 4133
117—House Document No. 254, 75th Congress, 1st session, entitled "A History of Navigation on the Tennessee River System" [omitted] 4212 4133
118—Chart entitled "Some Industrial and Commercial Centers Reached by Interior Waterway System with Waterway Distance Between Them" (original exhibit) [omitted] 4213 4134
119—Map entitled "Population Concentration along Interior Waterway System" (original exhibit) [omitted]..... 4213 4134
120—Chart showing principal crops produced in the Tennessee Valley (original exhibit) [omitted] 4213 4134
121—Chart showing types of forest resources in and around the Tennessee valley (original exhibit) [omitted] 4213 4134
122—Chart entitled "Producing Centers for Some Basic Minerals in the Tennessee Valley" (original exhibit) [omitted]... 4214 4134
123—Map showing traffic-producing regions touched by interior waterway system (original exhibit) [omitted]..... 4214 4135
124—Chart entitled "Railroad Freight Origins and Terminations in Tennessee Valley and Contiguous Areas, 1932" (original exhibit) [omitted] 4214 4135
125—Chart showing ton-miles of traffic on the Tennessee River from 1933 to 1936 (original exhibit) [omitted] 4214 4135
126—Tabulation showing estimated tonnage movement on the Tennessee River for 1937, assuming complete navigation facilities 4215 4136
127—Chart entitled "Comparative Unit Function Costs—1932" 4216 4136
128—Table showing ratio of transportation savings by use of the Tennessee River to transportation charges by all-rail routes on tonnages obtained from recent traffic survey 4217 4136
129—Table entitled "Railroad Freight Traffic—Southern District" 4218 4136

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.
Defendants' Exhibits Nos.—Continued. Original Print
130—Chart showing tonnage, actual and estimated, moving on Mississippi River system since 1814 (original exhibit) [omitted] 4219 4137
131—Tabulations showing gasoline and kerosene shipments — comparative rates when shipped by rail and by water-truck, etc. 4220 4139
132—Graph headed "Tennessee River Tonnage Graph, Calendar Year 1936" (original exhibit) [omitted] 4230 4149
133—Tabulation showing estimated power requirements of four groups of utility companies 4231 4150
134—Details of computations, study of load forecast and power requirements of four groups of utility companies..... 4232 4151
135—Stipulation as to ownership of complainants' stock and securities..... 4260 4171
136—Stipulation relating to description and tabulation of TVA transmission lines and substations and lines served by TVA 4264 4175
136a—Map showing lines and substations of the TVA in service, under construction, and authorized (original exhibit) [omitted] 4275 4185
136b—Map showing rural lines owned by municipalities and cooperatives purchasing power from TVA and rural lines owned by TVA (original exhibit) [omitted]... 4275 4185
137—Map showing lines and substations of TVA and lines and substations purchased or optioned by TVA from C. & S. companies (original exhibit) [omitted] 4275 4185
138—Map showing transmission lines of the TVA and of private utilities (original exhibit) [omitted] 4275 4185
139—Chart entitled "Approximate System Operation Dry Year Like 1925"..... 4276 4186
140—Tabulation showing status of TVA generating capacity as of December 31, 1937 4277 4187
141—Tabulation showing successive steps of installation and estimated firm power capacity 4278 4188
142—Tabulation showing water releases at Norris, Wheeler, and Wilson Dams, June 1936 through November 1937—comparisons of total discharges with discharges available for generation..... 4279 4189

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.
Defendants' Exhibits Nos.—Continued. Original Print
143—Summary of contracts for disposition of power by TVA as of December 15, 1937 4282 4192
143a—Contract of January 4, 1934, between TVA and C. & S. 4284 4195
143b—Amendment to contract of January 4, 1934, between TVA and C. & S. 4318 4225
144—Power contract between TVA and Lincoln County Electric Membership Corporation executed December 11, 1937 4322 4227
145—Power contract between TVA and Arkansas Power & Light Company dated June 16, 1937 4328 4235
146—Amendatory contract between TVA and Aluminum Company of America dated July 20, 1937 4328 4236
147—Twelve tabulations showing analysis of power disposition and use by TVA 4329 4237
148—Tabulation showing use of Norris and Wheeler Dams for power supplied to C. & S. companies, June through December 1936 4346 4254
149—Tabulation showing hydro system power data, calendar years 1926 through 1937 4347 4255
150—Stipulation regarding purchase of TVA power by C. & S. companies 4348 4255
151—Tabulation indicating storage in TVA mainstream projects in acre-feet 4357 4263
152—Excerpts from pages 71 to 73 of House Document 328 4358 4263
153—Report of Subcommittee of the Committee on Appropriations on the Independent Offices Appropriation Bill for 1938 (original exhibit) [omitted] 4361 4265
154—Annual Report of the Tennessee Valley Authority for fiscal year ending June 30, 1937 (original exhibit) [omitted] 4361 4266
155—Resolution of the Board of Directors of TVA, dated December 20, 1937, authorizing the acquisition of land for Gilbertsville Dam and fixing the maximum pool level thereof 4362 4266
156—Resolution of the Board of Directors of TVA, dated December 20, 1937, authorizing and directing the General Manager to write a letter to Congressman Woodrum regarding Gilbertsville Dam 4363 4267

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.
Defendants' Exhibits Nos.—Continued. Original Print
157—Resolution of the Board of Directors of TVA, dated February 20, 1936, revoking the authority to exercise the option of January 4, 1934, to acquire electrical properties of the TEP Company in the Norris Dam area 4365 4269
158—Resolution of the Board of Directors of TVA, dated January 25, 1935, rescinding the contract between the Authority and Alabama Power Company, dated August 9, 1934 ..... 4366 4270
Appendix "A"—Excerpts read into record by defendants from Complainants' Exhibit No. 105.... 4368 4271
Appendix "B"—Excerpts read into record by defendants from Complainants' Exhibit No. 107..... 4372 4276
Appendix "C"—Excerpts read into record by defendants from Complainants' Exhibit No. 108..... 4373 4276
Appendix "D"—Excerpts read into record by defendants from Complainants' Exhibit No. 109.... 4376 4278
Appendix "E"—Excerpt read into record by defendants from Complainants' Exhibit No. 112..... 4379 4282
Appendix "F"—Excerpts read into record by defendants from Complainants' Exhibit No. 114..... 4380 4282
Appendix "G"—Excerpts read into record by defendants from Complainants' Exhibit No. 115..... 4393 4295
Appendix "H"—Excerpts read into record by defendants from Complainants' Exhibit No. 116..... 4408 4315
Appendix "I"—Excerpts read into record by defendants from Complainants' Exhibit No. 365..... 4435 4345
Appendix "J"—Excerpts read into record by defendants from Complainants' Exhibit No. 366..... 4439 4348

Record from D. C. U. S., Eastern District of Tennessee—Continued.
Statement of evidence—Continued.

[fol. 4080] DEFENDANTS' EXHIBIT No. 3

Order by Railroad and Public Utilities Commission of the State of Tennessee, Dated May 18, 1937

Before the Railroad and Public Utilities Commission of the State of Tennessee

Nashville

May 18, 1937.

Docket No. 2030

In re West Tennessee Power and Light Company Application for Rural Line Extensions on Humboldt Road, Lower Brownsville Road and Old Pinson Road

Opinion and Order

This Commission on January 1, 1937, in Docket No. 2025, on its own initiative, issued an order requiring all public utility companies operating in the State of Tennessee to obtain approval of the Commission before beginning the construction of any line extension, the voltage of which is to be operated at or in excess of 4000 volts, or where the cost of such extension exceeds $5,000.00.

In compliance with this order the West Tennessee Power and Light Company, a privately owned utility operating in Madison County and several other West Tennessee counties, made application with the Railroad and Public Utilities Commission on January 11, 1937, for authorization to construct three rural extensions to its present rural lines. Each of these extensions was to be operated in excess of 4000 volts, though each was to be for a cost of less than $5,000.00.

We are setting out below the extensions in question:

Line No. 1:

A 13 kv. line from the end of the present line on the Humboldt Road, approximately five miles north of the City of Jackson to Fairview—Distance 4.1 miles—Number of prospective customers 12—

Estimated Annual Earnings	$360.00
Estimated Cost of Line	4,100.00

DEFENDANTS' EXHIBIT No. 3

[fol. 4081] Line No. 2:

A 7 kv. line from the end of the present line on the lower Brownsville Road, approximately three miles west of the City of Jackson to Witherspoon's Store—Distance 3.4 miles—Number of prospective customers 19—

Estimated Annual Earnings	$570.00
Estimated Cost of Line	3,400.00

Line No. 3:

A 13 kv. line on the Old Pinson Road, beginning at a point approximately 1,000 feet south of where the Old Pinson Road intersects the Harts Bridge Road, and running one mile south—Number of prospective customers 12—

Estimated Annual Earnings	$360.00
Estimated Cost of Line	1,000.00

This line is a branch off our Jackson-Henderson 13 kv. Transmission Line, which is located on private right-of-way, and parallels the Old Pinson Road.

The petition sets out that the above three lines had been planned and surveyed and the necessary material ordered prior to the issuance of the Commission's order on January 1, 1937.

Parties interested in the extension of rural lines were notified of the petition filed by the West Tennessee Power and Light Company, and the Southwest Tennessee Electric Membership Corporation, a corporation organized under the non-profit electric membership cooperative statutes of this State, filed a formal protest with the Commission opposing the granting of the authority requested by the West Tennessee Power & Light Company, and asked for an opportunity to be heard before the Commission in the matter.

Upon receipt of protest the matter was set for hearing before the Commission on February 3, 1937. This case was heard before the Commission on February 3, 1937, and at this hearing all interested parties were given an opportunity to present such evidence and information as they desired.

The West Tennessee Power & Light Company presented testimony showing that the West Tennessee Power & Light Company proposed to build three lines.

DEFENDANTS' EXHIBIT No. 3

1. Line No. 1 extends from the end of the present line on Humboldt Road approximately five miles north of the City of Jackson to Fairview, a distance of 4.1 miles. The company estimated that it would serve on this extension approximately twelve customers with an estimated annual earning of $360.00.

The estimated cost of constructing this line was placed at 1,100.00.

Representatives of the West Tennessee Power & Light Company testified that it was necessary that this line be constructed in order to insure excellence of service between Jackson and territory in the neighborhood of Fairview, since by the construction of this line the West Tennessee Power & Light Company would be in position to furnish service through Humboldt or through Jackson, and would be [fol. 4082] of advantage to the company in furnishing the best possible service to its customers.

2. Line No. 2 is the proposed line from the end of the present lines on the lower Brownsville Road, approximately three miles west of the City of Jackson to Witherspoon's Store, an approximate distance of 3.4 miles. The company estimated that it would serve approximately nineteen customers on this extension with an estimated annual earning of $570.00.

3. Line No. 3 is a proposed line beginning at approximately 1,000 feet south of where the old Pinson Road intersects the Harts Bridge Road, extending about one mile south. The Exhibit sets forth that there were twelve prospective customers with an estimated annual earning of $360.00.

It appears that the West Tennessee Power & Light Company does not have contracts with prospective customers but has completed surveys with reference to the three lines proposed and estimates that it will be able to serve twelve customers on each of two of the said lines and a few more than that on the third.

The Southwest Tennessee Electric Membership Corporation has proposed, according to evidence presented at the hearing, a development for rural electric service in Madison County since 1934. (This date should be 1935.)

DEFENDANTS' EXHIBIT No. 3

The Southwest Association is the successor of certain prior electric membership corporations projected for the same purpose, one of which was the Madison County Electric Membership Corporation. For reasons satisfactory to such associations, the project was finally united under one cooperative, that involved here, which proposes to serve rural users of electricity in Madison, Haywood and Tipton Counties.

It appears that the Southwest Association has signed contracts with over four hundred prospective customers for electric service. The Southwest Tennessee Electric Membership Corporation proposes to purchase electric energy for distribution in the territory in which it is planning to operate from the Tennessee Valley Authority at wholesale rates. The Cooperative proposes to serve more than four hundred customers in Madison County immediately, and desires to begin its construction activities within the next two or three months, and in fact some of the materials have been purchased and are ready for erection at this time. Over a period of one or two years the present cooperative association and its predecessors have been making surveys with reference to furnishing rural service in Madison County. These surveys were finally completed and when all requirements of the Rural Electrification Administration had been satisfactorily complied with, the grant of a loan was obtained from the REA for the construction of the project in the entire three counties which it proposes to serve.

The Cooperative insists that its contracts are signed with the various customers which the West Tennessee Power & Light Company expects, as a result of its survey, to furnish with electricity, and it is the contention of the Cooperative that each of the three lines proposed to be constructed by the West Tennessee Power & Light Company would seriously interfere with the entire project planned by it.

The three proposed lines of the West Tennessee Power & [fol. 4083] Light Company, as is clearly shown by maps of Madison County filed at the hearing, would parallel the proposed lines of the Southwest Tennessee Electric Membership Corporation. The officers of the Cooperative Association believe, rightly or wrongly, that these three proposed lines were located at key points and designed to draw out

of the cooperative project certain well-situated customers, and would have the effect, if not the purpose, of wrecking or seriously handicapping the construction of the project proposed by it and approved by the Rural Electrification Administration.

On the other hand, the company asserts that the construction of these rural lines, as proposed by it, is in good faith, and without any purpose or thought to hinder or oppose the cooperative, in pursuance to its long-range program of providing electric service to those economically prepared to receive same in Madison County.

In the many years that the Power Company has served Madison County, it has made electricity available to approximately five hundred rural customers. Most of these customers reside along the highways upon which the company's transmission lines run.

It is interesting to note that on the three specific projects that are before the Commission, the cooperative association proposes to serve nearly double the number of customers which are regarded as prospects by the power company. The power company also states that its experience in the past has been that the surveys it has made have proved to be accurate, and that the number of customers it estimates it can serve usually turns out to be the number actually served.

It appears, upon all the facts adduced at the hearing, that there is a grave probability that the authorization of the three proposed extensions of the West Tennessee Power and Light Company would seriously injure the program of the Southwest Tennessee Electric Membership Corporation. It would not only deprive this corporation of certain customers which it already has under contract, but in doing so it would increase the difficulty of extending service to other proposed customers who reside slightly further on and are proposed to be served by the cooperative, and would render the cost of furnishing service to certain groups uneconomical and prohibitive.

Under this showing it would appear that the greater good to the greater number would be best served by denying to the power company the authority to construct the lines petitioned for even though this denial may temporarily em-

barrass some of the prospective customers who would immediately obtain electric service otherwise.

This Commission does not have jurisdiction over any cooperative association. The problems arising from the entry of such associations into the utility field are of comparatively recent origin. However, the Public Service Commission of Wisconsin has been confronted with these problems and has taken appropriate action to solve them. While the opinion of this Commission, because of variances in the statutes of the two states, is in many respects not germane to the questions involved here, many of the principles there enunciated are pertinent to those issues. For its clear and distinct analysis of those problems arising from the extension of rural lines, wherein the cooperatives are brought in conflict with the utilities, we quote from the opinion of the Wisconsin Commission the following:

[fol. 4084] "We hold no brief for or against any agency in this competitive struggle. Our primary concern is in seeing that the maximum number of farmers get service at the lowest cost consistent with the requirements for adequate and continuous service. We feel that the agency which should serve, assuming minimum requirements of service standards, financial responsibility, etc., are met, is largely a matter of choice with the farmers themselves, as long as wasteful competition or duplication of facilities will not result. The Commission has steadfastly adhered to, and repeatedly expressed, this view, both formally and informally. To obtain this objective of an orderly development of rural electrification, some rules and procedure are necessary. Since this Commission is the only agency having any jurisdiction over any of these competing agencies, we have established and propose to continue certain rules which, within our legal powers are designed to promote orderly procedure and to prevent unregulated and wasteful competition * * * When the public utility statutes are read as a whole, they evidence a legislative policy of giving the Commission broad authority to regulate utilities so as to accomplish an orderly development of utility service, without wasteful territorial competition and duplication, except where no other remedy is feasible. These powers are additional to those involved in prescribing reasonable and non-

discriminatory rates, rules, and regulations and others functions associated therewith." In re: Extensions of Rural Lines of Electric Utilities, No. 2-U-965, Wis. P. S. C. Aug. 27, 1936.

The Wisconsin Commission further said, in denying the application of the Wisconsin Power & Light Company to extend its rural electric lines:

"The principal question presented by this application is whether the company should be authorized to extend its rural distribution system * * * when construction of cooperative electric lines is now under way in the area. This is the first time this question has come to us for decision, since the Richland County cooperative is the first in the state to get construction started. A brief statement of the law as the Commission understands it seems appropriate in connection with the consideration of this question. Section 196.49 of the Wisconsin Statutes, under which the Commission has jurisdiction over public utility extensions of plant, was enacted in 1931 and is clearly a restrictive law to prevent unwarranted expansion of utility facilities beyond service demands in the immediate future. At the time the law was enacted, it was assumed that indeterminate permits existed in towns as well as in cities and villages. The Wisconsin Supreme Court in 1932 held otherwise. In South Shore Utility Co. v. Railroad Commission, 207 Wis. 95, the state's highest court held that under existing statutes towns have no authority to grant exclusive permits or franchises to public utilities. Therefore rural territory is an open field so far as franchise rights are concerned. Section 196.49 (1) provides that a public utility on and after August [fol. 4085] 1, 1931, must secure a certificate of authority from the Commission before extending facilities or rendering service in a municipality where neither it or any other public utility was legally operating on that date. Section 196.49 (2) permits the Commission to issue a general order with which public utilities must comply before beginning 'construction, installation, or operation of any new plant, equipment, property or facility * * * extension * * * ' General Order 2-U-20 was issued under this subsection and has been used, together with territorial division agreements between utilities, to prevent the chaotic, waste-

ful, and unrestricted competition for rural territory that might otherwise have resulted from the South Shore decision. Section 196.49 (4) provides that the Commission in its general or special order may require that no new construction shall be begun until it has found that public convenience and necessity require it. * * * Commission is also given power to grant authority for only a portion of a project or to lay down terms and conditions that will insure that a project meets the requirements of this section of the law.

For more than a year the Federal Government, through the Rural Electrification Administration, has been offering to lend funds for building new rural lines. In this State a rural electrification coordination committee was formed to aid in promoting cooperative associations of farmers desiring to borrow funds for the construction of lines to serve themselves. * * * No single governmental body under present interpretations of the Statutes, as we understand the interpretations, has jurisdiction over both public utilities and cooperatives. The Schumacher case, 185 Wis. 303, is urged upon the Commission as a holding by the Wisconsin Supreme Court that cooperative associations which serve only their members are not public utilities which, under existing statutes would be subject to this Commission's jurisdiction. If such be the fact the Commission cannot enforce its orders upon cooperatives nor compel them to render service to members of the public who request service. The Commission is confronted with the question of deciding the extent to which the presence of cooperative facilities must be considered in determining whether public convenience and necessity require an extension of public utility facilities proposed to be made in an area. The Commission decided that the best way to promote orderly and economic development of rural electrification under provisions of a statute enacted long before REA-financed electric cooperatives had been conceived was to issue a general order applying solely to rural electric extensions by public utilities. This order is 2-U-965. * * * A procedure is there provided for equitable settlement of conflicts between public utilities and electric cooperatives seeking to operate in the same areas. The cooperative is given opportunity to object to a utility extension and to be heard in opposition before

the Commission; the utility may make limited extensions without specific authority for unlimited extensions in areas [fol. 4086] as to which agreements have been reached with cooperatives or where electrification by public utilities has reached a point of saturation that leaves no opportunity for the profitable establishment of a cooperative. * * * It is the Commission's duty under Section 196.49 to safeguard customers and investors of public utilities against excess facilities. * * * The field survey by our engineer indicates that this area is not capable of supporting two competing electric service agencies with any assurance that cost of service will be regained in revenues by the company and by the cooperative.

Members of the cooperative and customers of the company who do not live in this area probably will be adversely affected if duplicate facilities are permitted, since the extra cost will immediately or eventually be reflected in their rates. To authorize public utility service to this group of 23 (customers signed by company) might delay cooperative service to a much larger group of cooperative members in nearby areas, who have waited as long as have the 23 for electricity. We presume that those of the 23 who are not already members of the cooperative may become so and be assured service from the cooperative." In re: Application of Wisconsin Power and Light Co., No. CA-237, Wis. P. S. C., December 3, 1936.

The Commission is further of the opinion that the West Tennessee Power and Light Company, however, should be permitted at this time to construct Line No. 1, as set out in its petition, in order that continuous and satisfactory service to area now served might be insured, but that the West Tennessee Power and Light Company should not be permitted to serve customers off this new Line No. 1 since in doing so it might keep electric service from being extended by the Southwest Tennessee Electric Membership Corporation to serve a greater number of customers and a greater area, since said line would parallel for some distance the proposed line of the cooperative.

The Commission is further of the opinion that the material ordered by the West Tennessee Power & Light Company for construction of these proposed lines can be used

advantageously for the construction of other lines and improvement of its existing transmission and distribution systems, and will not result in a loss to the company because of refusal to this Commission to approve the specific projects in the application.

It is Therefore Ordered by the Commission:

That the petition of the West Tennessee Power & Light Company asking for approval of the Commission for the building of the following lines be denied:

[fol. 4087] Line No. 2—a 7 kv. line from the end of the present line on the lower Brownsville Road, approximately three miles west of the City of Jackson to Witherspoon's Store—Distance 3.4 miles.

Line No. 3—a 13 kv. line on the old Pinson Road, beginning at a point approximately 1,000 feet south of where the Old Pinson Road intersects the Harts Bridge Road, and running one mile south.

It is Further Ordered, That the West Tennessee Power & Light Company be hereby authorized to construct the following line for the purpose of improving its existing transmission and distribution systems with the provision that the West Tennessee Power & Light Company be denied permission to serve any customers off this connecting line without the specific approval of the Commission:

Line No. 1—a 13 kv. line from the end of the present line on the Humboldt Road, approximately five miles north of the City of Jackson to Fairview—Distance 4.1 miles.

It is Further Ordered, That the Commission retain jurisdiction in this cause and issue such further and future orders as it may deem necessary from time to time.

Porter Dunlap, Chairman; W. H. Turner, Commissioner; Leon Jourolmon, Jr., Commissioner.

I, Dorsey B. Thomas, Secretary of the Railroad and Public Utilities Commission of the State of Tennessee do hereby certify that the foregoing is a true and correct copy of order issued by the Commission in Docket No. 2030.

This 18 day of May, 1937.

(S.) Dorsey B. Thomas, Secretary. (Seal.)

CSR.

[fol. 4088] DEFENDANTS' EXHIBIT No. 4

Resolution by the Board of Commissioners of the City of Chattanooga, Dated October 24, 1933

Whereas, the City of Chattanooga, Tennessee desires to make formal application to the Tennessee Valley Authority for the furnishing of electrical current to said City and its inhabitants; and

Whereas, the City of Chattanooga does not own a distribution system and has no legislative authority to finance the construction or acquiring of a distribution system,

Now, Therefore, Be It Resolved by the Board of Commissioners of the City of Chattanooga, Tennessee that on behalf of said City application be and is hereby made to the Tennessee Valley Authority for the furnishing of electric current to the City of Chattanooga for the use of said City and its inhabitants. This application is on condition, however, that the said City obtains legislative authority to construct or acquire a distribution system, and obtains legislative authority to finance the construction or acquiring of a distribution system and, if after investigation it is found that the furnishing by the Tennessee Valley Authority of electric current is to the best interest of the City and its inhabitants.

[fol. 4089] DEFENDANTS' EXHIBIT No. 5

Letterhead of City of Chattanooga, Tennessee

October 3, 1933.

Tennessee Valley Authority, Attention Mr. David Lilienthal, Knoxville, Tenn.

MY DEAR MR. LILIENTHAL:

As you are perhaps aware, the City of Chattanooga at present has no authority that would enable us to finance a distributing plant; but it is our purpose if investigations show it to be profitable, to distribute power secured from the Tennessee Valley Authority.

The authority we need cannot be secured until another Session of the Legislature of Tennessee. Will you kindly inform me that if under these circumstances we should at

DEFENDANTS' EXHIBIT No. 5

this time make application for electric power for City of Chattanooga; it being understood that application is contingent upon investigations and securing authority heretofore referred to.

Assuring you of my very high regard, I am,

Sincerely yours, (S.) E. D. Bass, Mayor City of Chattanooga.

[fol. 4090] DEFENDANTS' EXHIBIT No. 6

Knoxville, Tennessee,
October 9, 1933.

Honorable E. D. Bass, Mayor of Chattanooga, Chattanooga, Tennessee.

MY DEAR MR. MAYOR:

I have your letter of October 3 asking me whether, in view of the lack of present legislative authority in the City of Chattanooga to finance a distribution system, the City should make application for power from the Tennessee Valley Authority "contingent upon investigations and securing authority" for such purposes.

I see no reason why the City of Chattanooga may not make a contingent application to the Tennessee Valley Authority. In point of fact, the only cities which are able to make a definite application are those which now own their distribution systems and are free to enter into contracts; such situations are not common. I think I should also point out that the number of applications or inquiries has grown so large that the matter of choice between the municipalities grows constantly more difficult.

In response to your inquiry, I hope you will understand that the question of whether the City of Chattanooga should or should not acquire its own distribution system is a matter of local policy to be determined wholly by the citizens of your City without any suggestion or influence whatever from the Tennessee Valley Authority. I hope that you will not regard my attempt to answer your question as in any wise a suggestion or recommendation favoring or disapproving this policy of the ownership of power facilities within your City.

DEFENDANTS' EXHIBIT No. 6

It was a pleasure to see you, and I look forward to other opportunities.

Sincerely yours, Tennessee Valley Authority, by David E. Lilienthal, Director and General Counsel.

DEL: JH.

[fol. 4091] DEFENDANTS' EXHIBIT No. 7

Letterhead of City of Chattanooga, Tennessee

Oct. 24, 1933.

Tennessee Valley Authority, Knoxville, Tenn.

Attn. Mr. David Lilienthal

MY DEAR MR. LILIENTHAL:

The City of Chattanooga is filing with the Tennessee Valley Authority today formal application for use of power for Chattanooga, based upon certain contingencies set out in application.

One of the first things we desire to do is to have a survey made of this city and locality with investigations and estimates as to cost of distributing plant and other matters connected therewith, in order that we might ascertain at what price this city could furnish power to consumers.

I have been informed that the Tennessee Valley Authority would make such survey and estimates for consumers asking for it, therefore may I ask you to advise me if this is correct, and if upon application the Tennessee Valley Authority would furnish the City of Chattanooga with this information.

Assuring you of my very high regard, I am,

Sincerely yours, (S.) E. D. Bass, Mayor City of Chattanooga.

[fol. 4092] DEFENDANTS' EXHIBIT No. 8

Letterhead of City of Chattanooga, Tennessee

March 19, 1934.

Tennessee Valley Authority, Attention Mr. David E. Lilienthal, Knoxville, Tenn.

MY DEAR MR. LILIENTHAL:

I am enclosing a copy of opinion furnished me by City Attorney J. W. Anderson referring to relation of contract entered into between the Tennessee Valley Authority and the Tennessee Electric Power Company in so far as said contract affects furnishing electrical energy to the City of Chattanooga by the Tennessee Valley Authority.

May I ask that you advise me, or have your attorney do so, if you concur with City Attorney Anderson's opinion in his construction of this contract with regard to the particular question of City of Chattanooga securing electrical energy from Tennessee Valley Authority. I would very much appreciate a reply at earliest possible moment.

For your information, city authorities of Chattanooga are preparing to employ engineers for the purpose of gathering such information as we will need in submitting the question of municipal ownership to the people. We expect to submit this question some time during the coming summer; and in securing the necessary data we shall avail ourselves of your kind offer contained in your letter of November 27, 1933 to me.

Assuring you of my very high regard, I am

Sincerely yours, (S.) E. D. Bass, Mayor City of Chattanooga.

EDB: WM.

[fol. 4093] DEFENDANTS' EXHIBIT No. 9

Letterhead of City of Chattanooga, Tennessee

March 26, 1934.

Mr. V. D. L. Robinson, Tennessee Valley Authority, Knoxville, Tenn.

BY DEAR MR. ROBINSON:

I would esteem it a very personal favor if it would be possible for you to see that I get a reply as soon as possible to my letter of March 19th to Mr. Lilienthal.

I know how very busy Mr. Lilienthal is, and how many inquiries he has, and if you can in any way expedite this matter I will appreciate it more than I can express.

Thanking you, I am,

Sincerely yours, (S.) E. D. Bass, Mayor City of Chattanooga.

[fol. 4094] DEFENDANTS' EXHIBIT No. 10

Resolution by the Council of the City of Knoxville, Adopted November 1, 1932

"Mayor O'Connor moved to direct the City Manager to make inquiry and study as to the cost of construction and operation of an electric power plant for the City of Knoxville. Carried."

[fol. 4095] DEFENDANTS' EXHIBIT No. 11

This exhibit is a part of Resolution No. 709 adopted by the Council of the City of Knoxville, Tennessee, on February 21, 1933. (Complainants' Exhibit No. 373.)

(Omitted).

[fol. 4096] DEFENDANTS' EXHIBIT No. 12

Minute Entry of the Council of the City of Knoxville, Dated July 11, 1933

"Councilman Smithson presented and read the following report of the Committee appointed to consider municipal power projects:

July 11, 1933.

To the Council of the City of Knoxville.

GENTLEMEN:

Your Committee appointed to consider municipal power projects, wish to recommend that the City Manager be instructed to make application for power and get all necessary information relative to the furtherance of this matter.

Respectively submitted, Charlton Karns, F. H. Snipes, W. S. Smithson.

Councilman Cockrum moved that the report be adopted and that the Mayor appoint a Committee to work with the City Manager. Carried. The following Committee was named by the Mayor: Councilmen Cockrum, Smithson and Karns."

Chattanooga, Tenn.,
March 7, 1930.

Yates Bleachery Company (hereinafter called the Consumer) hereby makes application to The Tennessee Electric Power Company (hereinafter called the Company), to furnish to the Consumer for his sole and exclusive use at Flintstone, Georgia, electric energy required or used by the Consumer for 2300 volt, 60 cycle, 3-phase service * * * subject to the Companys' standard rates and rules and regulations as now or hereafter on file with the Railroad and Public Utilities Commission of the State of Tennessee from the date service begins under this application and thereafter until thirty (30) days written notice to discontinue

DEFENDANTS' EXHIBIT No. 13

shall have been given by either of the parties hereto to the other.

[fol. 4098] The Consumer agrees to pay monthly for all electric service furnished under this application at the rates specified in Schedule 1, Rate A of the Company's rates now or hereafter on file with the Railroad and Public Utilities Commission of the State of Tennessee.

The Demand contracted for is 30 kw.

The Consumer agrees to pay a minimum monthly charge of $—.

This application cannot be transferred or assigned by the Consumer.

All agreements, rules and regulations printed on this sheet shall be deemed a part hereof.

Yates Bleachery Co., by A. E. Yates, Prest.

The Tennessee Electric Power Company, by P. E. Shacklett, Asst. Mgr., Chattanooga District.

Rules and Regulations attached to the application are omitted.

[fol. 4099] DEFENDANTS' EXHIBIT No. 14

Letterhead of The Tennessee Electric Power Company, Chattanooga, Tennessee

April 13, 1937.

Yates Bleachery Company, Flintstone, Georgia.

GENTLEMEN:

In reference to the power contract signed today, April 13, 1937, we recognize and go on record as approving the use of lighting in connection with the plant, the use of light and power at the homes of Mr. A. E. Yates and Mr. T. A. Yates, officials of the Yates Bleachery Company, and the use of light and power at the company store as being "incidental to the business" of operating the bleachery.

Assuring you of our pleasure in welcoming you again as a customer, and pledging our facilities to make this contract one of mutual advantage, I am,

Yours very truly, E. D. Reed, Manager Chattanooga District.

Item for Logs, Posts, Poles much too high as the general trend for traf
be an indefinite decrease. Total predicted above is 1.684.105 tons, s
It would be more nearly correct to allow only half of this traffic a
balance of this item transferred to Misc. to allow for new move
contingencies.

Another transfer to Misc. would be about 200,000 tons of traffic between Knoxville and Chattanooga which covers some of the duplications in H. Doc. 328, not corrected above. This would give about 1,000,000 tons for contingencies – O. K.

April 10, 1935.

Paragraph 2, Subdivision (f) of Part Two of said Agreement reads as follows:

"2 Preliminary Proceedings by Borrower. When the Agreement has been signed on behalf of the Borrower, the Borrower shall promptly: • • •

(f) Submit for approval a contract with the Tennessee Valley Authority stipulating that the said Authority will agree to furnish to the Borrower for a period of not less than twenty years, to a point or points adjacent to the limits of the City and previously agreed upon, and the Borrower to accept and pay for a supply of electric energy sufficient in quantity at all times to meet the demands of the [fol. 4103] residential, commercial, and industrial customers to be served by the System. This contract shall contain such other terms and conditions as may be necessary to insure to the Borrower an adequate supply of electric energy, to insure the charging of rates by the Borrower for resale of electric energy and to provide for the disposition of revenues derived from the operation of the System in a manner satisfactory to the administrator."

Paragraph 4, Subdivision (g) of Part Four of said Loan Agreement reads as follows:

"4. *Conditions Precedent to the Government's Obligations.*—The Government shall be under no obligation to pay for any of the Bonds or to make any grant: • • •

(g) *Tennessee Valley Authority Contract.*—If the Borrower shall fail to execute and furnish the Government with two certified copies of a contract between the Borrower and the Tennessee Valley Authority, as provided in Paragraph 2 (f) Part two hereof, such contract to be satisfactory to the Administrator as to form, sufficiency and substance; as to rates to be charged by the Borrower for resale of elec-

DEFENDANTS' EXHIBIT No. 17

trical energy; and as to disposition of revenues of the system;"

[fol. 4104] The provisions of Paragraph 2, Subdivision (f) of part Two and of Paragraph 4, Subdivision (g) of Part Four of said Loan Agreement are hereby waived.

Approved.

United States of America, by —— ——, Administrator.

Superseding Loan and Grant Agreement Between the City of Knoxville, Tennessee, and the United States of America

(PWA Docket No. 3289)

Whereas, the United States of America and the City of Knoxville, Tennessee, entered into a loan and grant agreement dated as of April 2, 1934, and

Whereas, it is deemed to the mutual advantage of said parties to terminate said loan and grant agreement and to substitute in place thereof a new agreement:

Now, therefore, it is agreed, by and between said parties, that said loan and grant agreement dated as of April 2, 1934, be and the same is hereby terminated.

It is further agreed by and between said parties, that the following agreement be substituted in lieu thereof:

1. Loan and Grant.—The United States of America (herein called the "Government") will aid in financing the construction of an electric distribution system, including a central sub-station, secondary sub-stations, and street light-[fol. 4106] ing system on the main streets and boulevards (herein called the "Project"), by making loan and grant to the City of Knoxville, Tennessee, (herein called the "Applicant"), in an amount not exceeding in the aggregate the sum of $2,600,000.

2. Method of Making Loan.—The Government will purchase, at the principal amount thereof plus accrued interest, from the Applicant, obligations of the description set forth below (or such other description as shall be mutually satis-

factory) in the aggregate principal amount of $2,000,000, less $300,000 of such obligations which have already been purchased and delivered prior to March 26, 1935, and less such amount of such obligations, if any, as the Applicant may sell to purchasers other than the Government:

(a) Obligor.—City of Knoxville;
(b) Type.—Negotiable, general obligations, coupon bond;
(c) Denomination.—$1,000.
(d) Date.—March 1, 1934;
(e) Interest Rate and Interest Payment Dates.—4 per cent per annum, payable semi-annually on March 1 and September 1;
(f) Place of Payment.—At the Chase National Bank, City and State of New York;
(g) Registration Privileges.—Registerable at the option of the holder as to principal only;

Docket No. 3289

(h) Maturities.—Payable on March 1 in years and amounts as follows:

[fol. 4107]

Year	Amount
1937	$10,000
1938	15,000
1939	20,000
1940	25,000
1941	30,000
1942	35,000
1943	40,000
1944	45,000
1945	50,000
1946	75,000
1947	100,000
1948	150,000
1949	175,000
1950-1953 (both incl.)	200,000
1954	225,000
1955	205,000

(i) Security.—Payable as to both principal and interest from ad valorem taxes which may be levied without limit

as to rate or amount upon all the taxable property within the territorial limits of the Applicant.

3. Amount of Grant.—The Government will make a grant in an amount equal to 30 per centum of the cost of the labor and materials employed upon the project. The Government will make the grant either wholly by the payment of money, or partly by the payment of money and partly by the cancellation of obligations purchased pursuant to this agreement or interest coupons attached thereto, in aggregate amount equal to the amount of the grant less the amount paid in money. In no event shall the grant, whether made partly by payment of money and partly by cancellation, or wholly by payment of money be in excess of $600,000.

4. Conditions Precedent.—The Government will be under [fol. 4108] no obligation to take up and pay for any bonds which it herein agrees to purchase or to make any grant;

(a) Financial Condition.—If the financial condition of the Applicant shall have changed unfavorably in a material degree from its condition as theretofore represented to the Government;

(b) Cost of Project.—If it appears that the Applicant will not be able to complete the Project described in this agreement for the sum allotted by the Government, or that the Applicant will not be able to obtain any funds which, in addition to such sum, shall be necessary to complete the Project;

5. Interest of Member of Congress.—No member of or Delegate to the Congress of the United States of America shall be admitted to any share or part of this agreement, or to any benefit to arise thereupon.

6. Bonus or Commission.—The Applicant shall not pay any bonus or commission for the purpose of obtaining an approval of the application.

7. Information.—The Applicant shall furnish the Government with reasonable information and data concerning the construction, cost, and progress of the work. Upon request the Applicant shall also furnish the Government, and any purchaser from the Government of at least 25 per

cent of the bonds, with adequate financial statements and other reasonable information and data relating to the Applicant.

[fol. 4109] 8. Bond Circular.—The Applicant shall furnish all such information in proper form for the preparation of a bond circular and shall take all such steps as the Government or any purchaser or purchasers from the Government of not less than 25 per cent of the bonds may reasonably require to aid in the sale by the Government or any such purchaser or purchasers of any or all of the bonds.

9. Insurance.—The applicant shall carry reasonable and adequate insurance upon the completed Project or any completed part thereof accepted by the Applicant or the system of which the Project is a part.

10. Name of Project.—The -p-llicant shall not name the Project for any living person.

11. Grant and Bond Payments.

(a) Payment for Bonds.—A requisition requesting the Government to take up and pay for bonds will be honored as soon as possible after such bonds are ready for delivery, if the bond transcript and other documents supporting such requisition are complete.

(b) Grant Payments.—From time to time after the execution of this Agreement the applicant may make a requisition or requisitions for payments on account of the grant. If such requisition is in proper form and is accompanied by a certificate of purposes showing in reasonable detail [fol. 4110] the purposes for which the funds will be used, the Government will make a payment or payments on account of the grant in an amount not to exceed 25 per cent of the previously estimated cost of labor and materials to be employed upon the Project.

(c) Final Grant Payment.—At any time after completing the Project, the Applicant may file a requisition requesting the remainder of the grant which, together with all previous payments on account of such grant, shall be an amount not in excess of 30 per cent of the actual cost of labor and materials employed upon the Project, and

not to exceed, in any event, the sum of $600,000. The final grant requisition will be honored if the documents necessary to support it are complete and work on the Project has been completed in accordance with the provisions of this agreement.

(d) Construction Account.—A separate account or accounts (herein collectively called the "Construction Account") shall be set up in a bank or banks which are members of the Federal Deposit Insurance Corporation and of the Federal Reserve System. The grant payments, the proceeds from the sale of the bonds (exclusive of accrued interest and an amount, if any, representing interest dur-
[fol. 4111] ing construction) and any other moneys which shall be required in addition to the foregoing to pay the cost of constructing the Project shall be deposited in the Construction Account, promptly upon the receipt thereof. All accrued interest paid by the Government at the time of delivery of the bonds shall be paid into a separate account (herein called the "Bond Fund"). Payments for the construction of the Project shall be made only from the Construction Account.

(e) Disbursement of Moneys in Construction Account.—Moneys in the Construction Account shall be expended only for such purposes as shall have been previously specified in the certificate of purposes filed with and accepted by the Government. All moneys remaining in the Construction Account after all costs incurred in connection with the Project have been paid shall either be used to purchase bonds, if any of the bonds are then held by the Government, or be transferred to the Bond Fund.

(f) Use of Moneys in Bond Fund.—Moneys in the Bond fund shall be expended solely for the purpose of paying interest on and principal of the bonds purchased pursuant to this agreement.

12. Construction of Project.—It is mutually agreed that the Project will be constructed in accordance with the following principles:

[fol. 4112] (a) That, in order to insure completion of the project within the funds available for the construction thereof, faithful performance of construction contracts will

be assured by requiring performance bonds written in an amount equal to 100% of the contract price by one or more corporate sureties financially able to assume the risk and that such bonds will be further conditioned upon the payment of all persons supplying labor and furnishing materials for the construction of the Project, unless it is required by the laws of Tennessee that protection for labor and materialmen be provided by a bond separate from the performance bond. In such latter case, a performance bond in an amount equal to 100% of the contract price supplemented by a separate labor and materialmen's bond in an amount not less than 50% of the contract price will be adequate.

(b) That, if the work on any proposed construction contract is hazardous, the contractor will be required to provide public liability insurance in amounts reasonably sufficient to protect the contractor.

(c) That minimum or other wage rates required to be predetermined by the law of Tennessee or local ordinance [fol. 4113] shall be predetermined by the Applicant in accordance therewith, and incorporated in the appropriate contract documents. In the absence of applicable law or ordinance, the Applicant shall predetermine minimum wage rates, in accordance with customary local rates, for all the trades and occupations to be employed on the Project, and incorporate them in the appropriate contract documents.

(d) That the work shall be commenced as quickly as possible after funds are made available and be continued to completion with all practicable dispatch in an efficient and economical manner.

(e) That all work to be performed under contracts to be let hereafter shall be performed in accordance with the provisions of the attached Exhibit A which is hereby made a part hereof; to insure this purpose appropriate provisions will be incorporated in all contracts (except subcontracts) for work to be performed at the site of the Project. (Exhibit A has been so worded that the provisions thereof may, if the Applicant desires, be inserted verbatim in such construction contract or contracts.) If any of the provisions [fol. 4114] contained in Paragraphs 5 to 16, inclusive, of

Exhibit A shall be held invalid, such invalidity shall not affect the validity and effectiveness of the other provisions of this agreement.

13. The Administrator shall have no rights or power of any kind with respect to the rates to be fixed or charged by the Project.

14. This agreement is made with the express understanding that neither the loan nor the grant herein described is conditioned upon compliance by the Applicant with any conditions not expressly set forth herein.

15. The parties hereto expressly agree that this entire contract is made subject to and shall be inoperative except to the extent that it is not in violation of the terms of the injunction granted March 26, 1935, and the decree entered by the Chancellor for Knox County, Tennessee on July 23, 1935, in the case of Tennessee Public Service Company vs. City of Knoxville and others and that to the extent that it is not in conformity with such decree it shall not become operative unless and until such decree is vacated or appropriately modified.

In Witness Whereof, the Applicant and the Government have respectively caused this Agreement to be duly executed as of February 20, 1936.

City of Knoxville, by —— ——, United States of America. Federal Emergency Administrator of Public Works, by —— ——, Assistant Administrator. (Seal.)

Attest: —— ——.

Accepted by Applicant. Date: December 7, 1935.

Federal Emergency Administration of Public Works

Washington, D. C., December 4, 1935.

PWA Docket No. 6587

CITY OF DECATUR,
Morgan County, Alabama:

1. Offer.—The United States of America (herein called the "Government") hereby offers to aid in financing the

construction of an electrical distribution system, including the low side of the substation and equipment (herein called the "Project") by making a loan and grant to the City of Decatur, Alabama (herein called the "Applicant") in an amount not exceeding in the aggregate the sum of $350,000.

2. Method of Making Loan.—The Government will pur- [fol. 4119] chase from the Applicant, at the principal amount thereof plus accrued interest, obligations of the description set forth below (or such other description as shall be mutually satisfactory) in the aggregate principal amount of $268,000, less such amount of such obligations, if any, as the Applicant may sell the purchaser other than the Government:

(a) Obligor: City of Decatur;
(b) Type: Special obligation, serial, coupon bond;
(c) Denomination: $1,000;
(d) Date September 1, 1934;
(e) Interest rate and interest payment dates: Four per cent per annum, payable on March 1, 1935, and semi-annually thereafter on September 1 and March 1 in each year;
(f) Place of Payment: At the office of the City Treasurer, Decatur, Alabama, or, at the option of the holder, at a bank or trust company in the Borough of Manhattan, City and State of New York;
(g) Registration privileges: At the option of the holder, as to principal only;
(h) Maturities: On September 1 in years and amounts as follows:

1937-1940	$9,000
1941 and 1942	12,000
1943 and 1944	14,000
1945-1954 incl.	18,000

[fol. 4120] (i) Security: Payable solely from and secured only by a first pledge of the revenues derived from the operation of the Project, after provision only for the reasonable cost of operation and maintenance thereof.

3. Amount of Grant.—The Government will make a grant in an amount equal to 30 per centum of the cost of the labor and materials employed upon the Project. The Gov-

ernment will make the grant either wholly by the payment of money, or partly by the payment of money and partly by the cancellation of obligations purchased pursuant to this offer or interest coupons attached thereto, in aggregate amount equal to the amount of the grant less the amount in money. In no event shall the grant, whether made partly by payment or money and partly by cancellation, or wholly by payment of money, be in excess of $100,000.

4. Conditions Precedent.—The Government will be under no obligation to take up and pay for any bonds which it herein offers to purchase or to make any grant;

(a) Financial Condition.—If the financial condition of the Applicant shall have changed unfavorably in a material degree from its condition as theretofore represented to the Government;

(b) Cost of Project.—If it appears that the Applicant will not be able to complete the Project described in this offer for the sum allotted by the Government, or that the [fol. 4121] Applicant will not be able to obtain any funds which, in addition to such sum, shall be necessary to complete the Project;

(c) Plans and Specifications and Certificate of Purposes.—If the Applicant shall not have filed with the Government plans and specifications for the Project accompanied by a certificate of purposes setting out in detail the amounts and purposes of the expenditures which the Applicant proposes to make in connection with the Project, and the Government shall not have accepted such plans and specifications and such certificate of purposes as showing that the Project will be constructed in such manner as to provide reasonable security for the loan to be made by the Government and to comply with Title II of the National Industrial Recovery Act in all other respects.

5. Interest of Member of Congress.—No member of or Delegate to the Congress of the United States of America shall be allowed to participate in the funds made available for the construction of the Project or to any benefit arising therefrom.

6. Bonus or Commission.—The Applicant shall not pay any bonus or commission for the purpose of obtaining an approval of the application.

7. Information.—The Applicant shall furnish the Government with reasonable information and data concerning the construction, cost, and progress of the work. Upon request the Applicant shall also furnish the Government, [fol. 4122] and any purchaser from the Government of at least 25 per cent of the bonds, with adequate financial statements and other reasonable information and data relating to the Applicant.

8. Bond Circular.—The Applicant shall furnish all such information in proper form for the preparation of a bond circular and shall take all such steps as the Government or any purchaser or purchasers from the Government of not less than 25 per cent of the bonds may reasonably require to aid in the sale by the Government or any such purchaser or purchasers of any or all of the bonds.

9. Insurance.—The Applicant shall carry reasonable and adequate insurance upon the completed Project or any completed part thereof accepted by the Applicant or the system of which the Project is a part.

10. Name of Project.—The Applicant shall not name the Project for any living person.

11. Grant and Bond Payments.

(a) Advance Grant.—Upon receipt of this offer, the Applicant may request an advance on account of the grant in an amount not exceeding 5 per cent of the estimated cost of labor and materials to be employed on the Project. This advance grant may be used for paying architectural, engineering, and planning fees, costs of surveys, borings and other preliminary investigations, cost of preparation of plans, specifications and other forms of proposed contract [fol. 4123] documents, and costs of advertisements for bids for contracts, and the printing of the bonds, but not in payment for the acquisition of lands, easements, or rights-of-way. The request for this advance shall be accompanied by a signed certificate of purposes in which shall appear in

reasonable detail the purposes for which such advance grant will be used.

(b) Payment for Bonds.—A requisition requesting the Government to take up and pay for bonds will be honored as soon as possible after such bonds are ready for delivery, if the bond transcript and other documents supporting such requisitions are complete.

(c) Intermediate Grant Requisitions.—Simultaneously with the delivery of and payment for the bonds by the Government, or, when bonds are taken up and paid for in more than one installment, simultaneously with the delivery of and payment for the final installment, if the Applicant has so requisitioned and if such requisition is accompanied by a signed certificate of purposes showing in reasonable detail the purposes for which the funds will be used, and that such funds will be used for items properly included as part of the cost of the Project, the Government will make a grant of an amount representing the difference between the advance grant and an amount equal to 15 per cent of said previously estimated cost of labor and materials to be employed upon the Project. When the Project shall be approximately 70 per cent completed the Applicant may file [fol. 4124] its requisition for an additional grant in an amount which, together with the amount previously paid on account of the grant, is equal to 30 per cent of the cost of labor and materials theretofore employed on the Project, but in no event in an amount exceeding the amount set forth in paragraph 3 hereof.

The intermediate grant requisitions will be honored if the documents necessary to support such requisitions are complete and work on the Project has progressed in accordance with the provisions of this offer relating thereto.

(d) Final Grant Payment.—At any time after completing the Project, the Applicant may file a requisition requesting the remainder of the grant which, together with all previous payments on account of such grant, shall be an amount not in excess of 30 per cent of the actual cost of labor and materials employed upon the Project, and not to exceed, in any event, the amount of the grant set forth in paragraph 3 hereof. The final grant requisition will be honored if the

documents necessary to support it are complete and work on the Project has been completed in accordance with the provisions of this offer relating thereto.

(e) Construction Account.—A separate account or accounts (herein collectively called the "Construction Account") shall be set up in a bank or banks which are members of the Federal Deposit Insurance Corporation and of the Federal Reserve System. The advance grant, the [fol. 4125] intermediate grants, the proceeds from the sale of the bonds (exclusive of accrued interest and an amount, if any, representing interest during construction), the final grant, and any other moneys which shall be required in addition to the foregoing, to pay the cost of constructing the Project shall be deposited in the Construction Account, promptly upon the receipt thereof. All accrued interest paid by the Government at the time of delivery of the bonds shall be paid into a separate account (herein called the "Bond Fund"). Payments for the construction of the Project shall be made only from the Construction Account.

(f) Disbursement of Moneys in Construction Account.—Moneys in the Construction Account shall be expended only for such purposes as shall have been previously specified in the certificate of purposes filed with and accepted by the Government. All moneys remaining in the Construction Account after all costs incurred in connection with the Project have been paid shall either be used to repurchase bonds, if any of the bonds are then held by the Government, or be transferred to the Bond Fund.

(g) Use of Moneys in Bond Fund.—Moneys in the Bond Fund shall be expended solely for the purpose of paying interest on and principal of bonds.

12. Construction of Project.—The following policies have been adopted by the Federal Emergency Administration of Public Works in order to effectuate the purposes of Title [fol. 4126] II of the National Industrial Recovery Act, and the making of the loan and grant herein set forth shall be subject to the condition that the Applicant, in the exer-

cise of its lawful discretion, shall adopt said policies and comply therewith in the construction of the Project:

(a) That if a project is to be constructed under contract, contracts should be awarded to the lowest responsible bidder pursuant to public advertisement and that every opportunity be given for free, open and competitive bidding for contracts for construction and contracts for the purchase of materials and equipment.

(b) That the use in the specifications or otherwise of the name of a proprietary product or the name of the manufacturer or vendor to define the material or product required, unless such name if followed by the term "or equal", is considered contrary to the policy of free, open and competitive bidding. Where such a specification is used in lieu of descriptive detail of substance and function, the term "or equal" is to be literally construed so that any material or article which will perform adequately the duties imposed by the general design will be considered satisfactory.

(c) That, in determining the lowest bidder for the supplying of materials and equipment, in the interest of standardization or ultimate economy, the contract may be awarded to other than the actual lowest bidder.

(d) That, in order to insure completion of a project [fol. 4127] within the funds available for the construction thereof, faithful performance of construction contracts will be assured by requiring performance bonds written in an amount equal to 100% of the contract price by — or more corporate sureties financially able to assume the risk and that such bonds will be further conditioned upon the payment of all persons supplying labor and furnishing materials for the construction of such project, except in cases in which it is required by the laws of Alabama that protection for labor and materialmen be provided by a bond separate from the performance bond. In such latter case, a performance bond in an amount equal to 100% of the contract price supplemented by a separate labor and materialmen's bond in an amount not less than 50% of the contract price will be adequate.

(e) That, if the work on any proposed construction contract is hazardous, the contractor will be required to provide public liability insurance and property damage insurance in amounts reasonably sufficient to protect the contractor and each subcontractor.

(f) That minimum or other wage rates required to be predetermined by the law of Alabama or local ordinance shall be predetermined by the applicant in accordance therewith, and incorporated in the appropriate contract documents. In the absence of applicable law or ordinance, the applicant shall predetermine minimum wage rates, in accordance with customary local rates, for all the trades and occupations to be employed on the project, and incorporate [fol. 4128] them in the appropriate contract documents.

(g) That the work shall be commenced as quickly as possible after funds are made available and be continued to completion with all practicable dispatch in an efficient and economical manner.

(h) That a project will be constructed in accordance with the provisions of the attached Exhibit A which is hereby made a part hereof; to insure this purpose appropriate provisions will be incorporated in all contracts (except subcontracts for work to be performed at the site of the project. (Exhibit A has been so worded that the provisions thereof, may, if the applicant so desires, be inserted verbatim in such construction contract or contracts.)

13. The Administrator and the Government shall have no rights or power of any kind with respect to the rates to be fixed or charged by the project, excepting only such rights as they may have as a holder of such bonds under the Constitution and laws of Alabama and the lawful proceedings of the Applicant, taken pursuant thereto, in authorizing the issuance of such bonds.

14. This offer is made with the express understanding that neither the loan nor the grant herein described is conditioned upon compliance by the Applicant with any conditions not expressly set forth herein. There are no other agreements or understandings between the Applicant and

the Government or any of its agencies in any way relating [fol. 4129] to said Project or to the financing or the construction thereof.

Docket No. 3125.

[fol. 4133] DEFENDANTS' EXHIBIT No. 24

Offer on December 4, 1935, by the Federal Emergency Administration of Public Works to make a loan and grant in the amount of $130,000 to the City of Tuscumbia, Alabama, for the construction of an electric transmission line and distribution system, accepted by said city on December 9, 1935.

To avoid repetition this exhibit is not set out herein at length. It is substantially the same as Defendants' Exhibit No. 21.

[fol. 4134] DEFENDANTS' EXHIBIT No. 25

Amendatory Loan Agreement, Dated as of June 6, 1935, Between the City of Sheffield, Alabama (Herein Called the "Borrower") and the United States of America (Herein Called the "Government")

Whereas, the parties hereto entered into an Agreement dated December 28, 1934, whereby the Borrower agreed to sell and the Government agreed to purchase bonds of the Borrower pursuant to a Revolution of the Administrator and Special Board of the Federal Emergency Administration of Public Works, to aid the Borrower in financing a project consisting of the construction of an electric transmission line and distribution system, and other necessary appurtenances thereto, and

Whereas, it is for the mutual benefit of both parties hereto to amend said Agreement dated December 28, 1934.

Now, Therefore, This Agreement Witnesseth:

That, the said Agreement dated December 28, 1934, be and is hereby amended as follows:

By striking out the date "June 1, 1934, in Paragraph 2 (e), Part One, of said Agreement and inserting in lieu thereof the date "April 1, 1935"; and

By striking out the words "At the rate of 4 per cent per annum, payable December 1, 1934, and semiannually thereafter on June 1 and December 1 in each year" in Paragraph [fol. 4135] 2(f), Part One, of said Agreement and inserting in lieu thereof the words "At the rate of 4 per cent per annum, payable October 1, 1935, and semiannually thereafter on April 1 and October 1 in each year"; and

By striking out the date "June 1" in Paragraph 2 (g), Part One, of said Agreement and inserting in lieu thereof the date "April 1"; and

DEFENDANTS' EXHIBIT No. 25

By striking out the maturities of the bonds in Paragraph 2 (g), Part One, of said Agreement and inserting in lieu thereof the following maturities:

Year	Amount	Year	Amount
1938	$10,000	1946	$11,000
1939	10,000	1947	12,000
1940	10,000	1948	12,000
1941	10,000	1949	12,000
1942	10,000	1950	12,000
1943	10,000	1951	12,000
1944	10,000	1952	12,000
1945	10,000	1953	12,000
		1954	12,000

It is Hereby Mutually Understood and Agreed except as hereinabove provided, that all of the terms and conditions of the Agreement dated December 28, 1934, shall apply and be considered a part of this Agreement.

In Witness Whereof, the City of Sheffield, Alabama, and the United States of America, have respectively caused this [fol. 4136] Agreement to be duly executed as of the day and year first above written.

City of Sheffield, Alabama, by W. H. Richeson, Chairman, Board of Commissioners. United States of America, by Harold L. Ickes, Federal Emergency Administrator of Public Works. (Seal.)

Attest: by Peter Schaut, City Clerk.

[fol. 4137] DEFENDANTS' EXHIBIT No. 26

Agreement Dated as of December 2, 1935, Terminating the Loan and Grant Agreement Dated as of December 28, 1934, the Amendatory Loan Agreement Dated as of April 6, 1935, and the Amendatory Loan Agreement Dated as of June 6, 1935, between the City of Sheffield, Colbert County, Alabama (Herein Called the "City") and the United States of America (Herein Called the "Government")

Whereas a Loan and Grant Agreement was entered into by and between the City and the Government dated as of December 28, 1934, and

DEFENDANTS' EXHIBIT 26

Whereas said Loan and Grant Agreement was amended by an Amendatory Loan Agreement by and between the City and the Government dated as of April 6, 1935, and

Whereas said Loan and Grant Agreement was further amended by an Amendatory Loan Agreement by and between the City and the Government dated as of June 6, 1935, and

Whereas it is to the mutual advantage of the City and the Government to terminate said Loan and Grant Agreement and said Amendatory Loan Agreements,

Now, Therefore, It is Hereby Agreed by and between the city and the Government that said Loan and Grant Agreement dated as of December 28, 1934, said Amendatory Loan Agreement dated as of April 6, 1935, and said Amendatory Loan Agreement dated as of June 6, 1935, be and the same hereby are terminated.

City of Sheffield, by —— ——, United States of America, Federal Emergency Administrator of Public Works, by —— ——, Assistant Administrator. (Seal.)

Attest: —— ——.

[fol. 4138] DEFENDANTS' EXHIBIT No. 27

Offer dated December 4, 1935, by the Federal Emergency Administration of Public Works to the City of Sheffield, Alabama, for a loan and grant in the amount of $230,000 for the construction of an electric transmission line and distribution system, accepted by said city on December 7, 1935.

To avoid repetition this exhibit is not set out herein at length. It is substantially the same as Defendants' Exhibit No. 21.

[fol. 4139] DEFENDANTS' EXHIBIT No. 28

Resolution of the Board of Directors of TVA Adopted March 5, 1936

Whereas, Under date of July 26, 1934, the Authority entered into a contract with the Tennessee Public Service Company by the terms of which the Authority agreed to

DEFENDANTS' EXHIBIT No. 28

buy and the Company agreed to sell certain electric transmission and distribution properties located in Knox County, Tennessee, all of which is more particularly described in said contract, and

Whereas, By Section XIV of said contract, the parties agreed that unless a closing date on or before September 30, 1934, for the consummation of the purchase and sale of said properties was fixed, neither party should, after said date, be under any further obligation under said agreement except by mutual consent, and

Whereas, The Board of Directors is satisfied that it is not for the best interest of the Authority to purchase said property, or any part thereof, under the terms and conditions contained in said agreement. therefore

Be it Resolved, That the Authority hereby abandons and terminates any rights it may have to execute any part of said agreement, and that said agreement, insofar as it remains in effect, is hereby terminated and rescinded.

Further Resolved, That any offers or tenders made by the Authority for the properties referred to in said contract are hereby withdrawn and revoked.

[fol. 4140] DEFENDANTS' EXHIBIT No. 29

Resolution of the Board of Directors of TVA, Adopted October 4, 1935

Whereas, On August 25, 1933, the Board released a statement setting forth a policy with reference to the generation, transmission, and disposition of surplus power by the Authority, such policy being commonly known as the "Power Policy," and

Whereas, Recent amendments to the Tennessee Valley Authority Act of 1933, and legislation passed by the legislatures of the various states of the Tennessee Valley during the past two years affect the policy of the Authority with regard to the transmission and disposition of surplus power, and

Whereas, Two years of experience in administering that part of the Authority's general program relating to the disposition of surplus power has made it advisable to re-

DEFENDANTS' EXHIBIT No. 29

state the principles governing the administration of such program, therefore

Be it Resolved, That the statement released on August 25, 1933, heretofore described and commonly known as the "Power Policy," is hereby rescinded and withdrawn.

Further Resolved, That the Board of Directors hereby appoints and instructs the following committee to formulate and submit to the Board its recommendations for a Statement of Policy setting forth the principles applicable to the disposition of surplus power in the light of recent statutory changes and the Authority's administrative experience:

David E. Lilienthal, Chairman. Llewellyn Evans. Barton M. Jones. C. Neil Bass. Wm. J. Hayes.

(Original Exhibit)

[fol. 4147] DEFENDANTS' EXHIBIT No. 41

Resolution of the Board of Directors of TVA, adopted July 20, 1937.

Resolved,

1. That there is hereby established a Water Control Planning Department.

2. Under the direction and general supervision of a Chief Water Control Planning Engineer responsible to the Chief Engineer, the Department shall perform the following duties:

a. Make engineering studies, investigations, surveys, maps, reports, and recommendations involving basic hydraulic, geologic, topographic, and cadastral data needed to determine the necessity and feasibility of projects required in the Authority's integrated program of river control. and to make these and other related data available as are required in the planning, location, design, construction and operation of dams, reservoirs, locks, powerhouses and other structures and physical facilities as are approved for such a program.

b. Prepare and issue instructions subject to review by the Chief Engineer governing the impounding and release of water at the various dams of the Authority to assure the maximum use of facilities and resources available for flood control, navigation and other purposes consistent with the requirements of the Tennessee Valley Authority Act and within the policies of the Board pursuant thereto; to define from time to time the extent to which water may be impounded and the stream flow limits within which impounded water may be used for the generation of electric power.

c. Coordinate and integrate its engineering planning activities with those of other Federal, state and local agencies engaged in similar work whenever feasible and consistent with economy of effort and the purposes of the Act.

d. Coordinate its studies, findings, reports and recommendations with the studies and recommendations and needs of other departments of the Authority to assure maximum attainment of the purposes of the Act and the policies of [fol. 4148] the Board in the development of a regional approach to the problems of water control on the rivers and on the land.

Volume of Main River Pools at Various Levels

The reference numbers (1) and (2) given in the tabulation refer to the following levels.

(1) Flat navigation pool level is the flat level throughout the pool which is required to furnish a depth of either 12 feet in the approach to the lock upstream or 11 feet over the lower lock sill.

(2) Normal pool level, as referred to by Tennessee Valley Authority is an arbitrary level generally defining the maximum level to which the pool will be raised during low water season, except for possibly a temporary rise of one foot above this caused by malaria control fluctuation.

Resolution of Board of Directors of Tennessee Valley Authority

July 1, 1936

226-6. After examining the provisions of Water Control Bulletins No. 1 and No. 2, submitted by the Hydroelectric Committee, and finding them satisfactory, the Board ordered a true copy of each bulletin filed with the Authority's records as Exhibit 7-1-36e, and then issued the following instructions which are to govern the preparation of subsequent bulletins and the administration of the provisions of all water control bulletins hereafter approved by the Board:

1. A Committee on Water Control Operations is created consisting of the Chief Water Control Planning Engineer and the Chief Electrical Engineer. This Committee shall prepare general regulations as to the control of water through the operation of reservoirs. In formulating these regulations, the Committee shall confer with the Chief Construction Engineer, the Chief Medical Officer, the General Solicitor, and the Superintendent of Power Operations, or their representatives. The regulations shall be transmitted to the office of the General Manager in the form of bulletins for submission to the Board of Directors and for general distribution after approval by the Board.

2. The Superintendent of Power Operations shall be responsible for the day to day operation of the gates within the limits of and consistent with the requirements established by the regulatory bulletins of the Committee. He shall fix the responsibility for load dispatching and gate operation at each dam. On dams under construction, a representative of the construction organization shall be designated to operate the gates.

3. The Engineering Data Division shall maintain current records of rainfall, runoff, and river flow, furnish daily

DEFENDANTS' EXHIBIT No. 65

reports and predictions, and designate a representative who will maintain daily contact with the Chief Load Dispatcher at Wilson Dam for the exchange of information.

Water Control Bulletin Number 1

June 30th, 1936

Reservoirs of the Authority are to be operated: First, to serve as navigation channels and maintain navigation depths in the reaches of the river below the reservoirs; and Second, to reduce the magnitude of flood peaks below. Re- [fol. 4166] quirements for the control of malaria and the temporary needs of construction shall be given due consideration. So far as consistent with the above procedure, as much water power available at the dams shall be converted into electricity as is feasible.

Water Control Bulletin Number 2

June 30, 1936

Confirming direction of June 18, 1936, which was responsive to recommendations for increasing navigable depths in the lower river, until further notice water shall be released from Norris Reservoir so as to maintain as nearly as may be a constant flow at Florence, Alabama, of 15,000 c.f.s.

Variations in the daily peak discharges at Wilson Dam should not be so large that minimum flow at the Florence gage will ever be less than 13,000 c.f.s. The regulation of the water level in the Wilson pool should be accomplished by varying the discharge at the Wheeler Dam. The water level above the Wheeler Dam should be varied so as to iron out, as far as possible, any fluctuations in the amount of water flowing into the Wheeler Reservoir.

Dec. 31, 1932	240,000	37.6	20,600	20,100
Mar. 29, 1936	235,000	37.1	0*	15,300

* Clinch River flow above Norris Dam was stored in the reservoir throughout the flood period. Serious flood stages in 1937 were also prevented by the operation of Norris Dam.

The flow given for the Clinch and Hiwassee Rivers is the estimated flow from these streams reaching Chattanooga at the time of the crest.

Defendants' Exhibit No. 69

[fol. 4170]

Contributions of Tributaries to Major Mississippi River Floods

Year of flood—Discharge in cu. ft. per sec. and per cent of total

Tributary	1903	1912	1913	1916	1922	1927	1929	1937
Upper Mississippi River at Grafton, Ill	246,000 15.2%	263,000 13.6%	265,000 13.4%	339,000 21.3%	297,000 18.3%	286,000 16.2%	243,000 17.3%	160,000 7.9%
Missouri River at Herman, Missouri	175,000 10.8%	336,000 17.4%	59,000 3.0%	257,000 16.1%	310,000 19.1%	407,000 23.0%	316,000 22.4%	
Ohio River at Mouth	1,200,000 74.0%	1,178,000 60.9%	1,583,000 80.3%	834,000 52.3%	848,000 52.1%	940,000 53.3%	793,000 56.5%	1,850,000 92.1%
Local Area Below Tributaries	Negligible	157,000 8.1%	64,000 3.3%	165,000 10.3%	171,000 10.5%	132,000 7.5%	54,000 3.8%	Negligible
Mississippi River at Columbus, Ky. (Approx.)	1,621,000 100%	1,934,000 100%	1,971,000 100%	1,595,000 100%	1,626,000 100%	1,765,000 100%	1,406,000 100%	2,010,000 100%

The tributary flows are the approximate flows synchronizing with crest in the Mississippi River.

Defendants' Exhibit No. 70

[fol. 4171] **Contribution of the Tennessee River at the Crest of the More Recent Mississippi River Floods**

Floods	Mississippi River at Cairo	Tennessee River at Gilbertsville (1 day previous)
Date of Crest	Stage	Discharge cu. ft. per sec.
March 26, 1897	51.7*	475,000
April 6, 1912	53.9*	225,000
April 9, 1913	62.5*	195,000
February 4, 1916	53.2	140,000
March 26, 1922	53.6	220,000
April 20, 1927	58.5*	225,000
March 19, 1929	52.7	205,000
April 16, 1936	52.8	330,000
February 4, 1937	59.6*	240,000

* Cairo is situated at the junction of the Ohio and Mississippi Rivers, 50 miles below the mouth of the Tennessee River.

Note: The stages shown for the 1913 and 1927 floods are stages estimated by the Mississippi River Commission for the flood flow as if confined to the channel. The actual stages were lower because of breaks in the levees.

The stages in the 1897 and the 1912 floods would have been higher if the levees had not broken. The 1937 flood stage would have been higher if it had not been for the Birds Point-New Madrid floodway.

[fol. 4175] DEFENDANTS' EXHIBIT No. 82

Table Showing Estimates of Reductions in Peak Discharge and Reduction in Flood Crest at Chattanooga for Various Systems of Reservoirs

Peak Discharge

Year	1926*	1936*	1917*
Natural Discharge	252,000	275,000	332,000
Regulated Discharge with:			
Norris, Hiwassee Reservoirs	190,000	235,000	265,000
Norris, Hiwassee, Chickamauga Reservoirs	152,000	176,000	219,000
Norris, Hiwassee, Coulter Shoals, Watts Bar, Chickamauga Reservoirs	130,000	157,000	190,000

Note: Discharge is given in cubic feet per second.

Flood Crest

Note: Flood stage is 30 feet at Chattanooga.

Natural Stage	38.4 ft.	41.3 ft.	47.7 ft.
Norris, Hiwassee	32.0 "	37.1 "	40.3 "
Reduction from Peak	6.4 "	4.2 "	7.4 "
Norris, Hiwassee, Chickamauga	27.4 "	30.4 "	35.3 "
Reduction from Peak	11.0 "	10.9 "	12.4 "
Norris, Hiwassee, Coulter Shoals, Watts Bar, Chickamauga	24.6 "	28.0 "	32.0 "
Reduction from Peak	13.8 "	13.3 "	15.7 "

* In the years indicated there were substantial floods on the Tennessee River which are assumed as floods for estimating the effect of reservoirs. These floods are the larger floods since 1900, for which data is available. The 1917 flood has not been exceeded at Chattanooga within the past 50 years.

[fol. 4188] DEFENDANTS' EXHIBIT No. 111

September 1, 1934.

District Engineer, U. S. Engineer Office, Nashville, Tennessee

DEAR SIR:

We would like to have the best information you are able to give us as to the number, size and arrangement of locks which will probably be required by the War Department for the middle and upper sections of the Tennessee River. At some of the damsites the space for structures is quite limited, and we are naturally anxious to plan for a lock layout which will ultimately require as little space as possible.

In this connection the following questions arise:

1. If one 360′ x 60′ lock is constructed initially, will the requirement be made that space be left for an additional 600′ x 110′ lock?

2. If one 600′ x 110′ lock is constructed initially, will the requirement be made that space be provided for the construction of an additional 360′ x 60′ lock, if and when required?

It is our thought that if by constructing the large lock initially we could avoid providing space for the additional smaller lock in the future, the construction cost would not be greatly increased, and at the same time we could obtain a much better arrangement of structures, as the space for the second lock, which would otherwise have to be bulkheaded, could be used permanently for spillway.

Of course, if the requirement is that only the smaller lock need be built initially, with no provision for an additional lock, the cost and space requirements would be even less, but we do not know whether this would meet what you consider the minimum provisions for navigation.

We would appreciate an answer to these questions as early as possible.

Thanking you, we are

Yours very truly, Jas. S. Bowman, Hydraulic Engineer.

JSB:mh.

[fol. 4189] DEFENDANTS' EXHIBIT No. 112

War Department,

Office of the Chief of Engineers, Washington

September 19, 1934.

Dr. Arthur Ernest Morgan, Chairman, Tennessee Valley Authority, Knoxville, Tennessee.

DEAR DR. MORGAN:

I am in receipt, by reference, of a letter from Mr. James S. Bowman, Hydraulic Engineer, Tennessee Valley Authority, to the District Engineer at Nashville, Tenn., dated September 1, 1934, asking as to the number, size and arrangement of locks required in the interests of navigation on the middle and upper sections of the Tennessee River, and pointing out the desire of the Authority to avoid leaving space for a second lock to be constructed at a later date.

The Tennessee River, for convenience in supervising navigation projects, has been divided into three parts, the Upper Tennessee, extending from the head of navigation to Chattanooga; the Middle Tennessee, extending from Chattanooga to Riverton; and the Lower Tennessee, extending from Riverton to the Mouth. The Department, after careful consideration, has adopted the following requirements for these sections, which are the minimum provisions necessary to meet the needs of navigation:

Upper Tennessee River:

The locks, 60 feet by 360 feet, to be constructed at the time the dams are constructed, with space enough for the construction of locks 110 feet by 600 feet.

Middle Tennessee River:

The locks, 60 feet by 360 feet, to be constructed at the time the dams are constructed with space enough for the construction of locks 110 feet by 600 feet.

Lower Tennessee River:

The locks, 110 feet by 600 feet, to be constructed at the time the dams are constructed with space left for the future construction of locks 60 feet by 360 feet.

DEFENDANTS' EXHIBIT No. 112

[fol. 4190] The provision of an auxiliary lock at a future date is essential to provide the means of maintaining uninterrupted navigation in case of accident to one lock and during periods when it will be necessary to have one lock out of commission for repair or overhaul. It is probably not necessary in every case to incur large initial expense in providing for the future locks but the arangements should not preclude their eventual installation. The District and Division Engineers will be glad to give their assistance in planning the most desirable layout at each site to provide for both the immediate and the prospective needs.

Very truly yours, (Signed) E. M. Markham, Major General, Chief of Engineers.

No. 32

Notice to Navigation Interests, Tennessee River

1. The attached drawings show the normal limits of General Joe Wheeler Pool, Tennessee River, and the location of the channel which has been marked for navigation throughout this pool.

2. Notice is hereby given that the following aids to navigation have recently been installed in the above pool:

Lock A No. 286.2.—A red or nun buoy marking left side of navigation channel.

Lower Melton Bluff No. 286.7—A black or can buoy marking right side of navigation channel.

Upper Melton Bluff No. 287.2.—A black or can buoy marking right side of navigation channel.

Lower Browns Island No. 289.4.—A red or nun buoy marking left side of navigation channel.

Lower Willard Chute No. 290.4—A red or nun buoy marking left side of navigation channel.

Upper Willard Chute No. 291.9.—A red or nun buoy marking left side of navigation channel.

Head Browns Island No. 292.7—A black or can buoy marking right side of navigation channel.

Head Browns Island No. 293.2.—A red or nun buoy marking left side of navigation channel.

Lower Browns Ferry No. 294.1.—A black or can buoy marking right side of navigation channel.

Upper Browns Ferry No. 294.7.—A black or can buoy marking right side of navigation channel.

Beaverdam Slough No. 295.3.—A black or can buoy marking right side of navigation channel.

Opposite Fox Branch No. 296.6.—A block or can buoy marking right side of navigation channel.

Beaverdam Slough Light No. 297.2.—A light on pile cluster on right side of navigation channel, which shows one

white flash every two seconds, and double 6′ x 6′ diamond boards.

Foot Byrd Island No. 298.0.—A red or nun buoy marking left side of navigation channel.

Foot Byrd Island No. 298.2.—A black or can buoy marking right side of navigation channel.

[fol. 4193] Byrds Island No. 299.7.—A black or can buoy marking right side of navigation channel.

Head Byrds Island No. 300.1 (Nun).—A red or nun buoy marking left side of navigation channel.

Head Byrds Island No. 300.1 (Can).—A black or can buoy marking right side of navigation channel.

Heintz Bar No. 300.8.—A red or nun buoy marking left side of navigation channel.

Heintz Bar Light No. 301.4.—A light on pile cluster on right side of navigation channel which shows one white flash every two seconds, and double 6′ x 6′ diamond boards.

Heintz Bar No. 302.1.—A black or can buoy marking right side of navigation channel.

Lower Decatur No. 303.4 (Can).—A black or can buoy marking right side of navigation channel.

Lower Decatur No. 303.4 (Nun).—A red or nun buoy marking left side of navigation channel.

Flint River Towhead No. 339.1.—A horizontally striped red and black nun obstruction buoy marking Flint River Towhead which is submerged.

3. The normal level of General Joe Wheeler Pool will be Elevation 555.0 which is equivalent to a reading of 21.0 on the upper gage at Wheeler Lock, or 20.9 on the U. S. Weather Bureau gage at Keller Bridge, Decatur.

4. Numbers of aids in the above list are miles above the mouth of the river.

5. Navigators are warned to clear all buoys by at least 50 feet.

6. Additional copies of this list may be obtained from the U. S. Engineer Office, P. O. Box 1070, Nashville, Tennessee, upon application.

C. E. Perry, Lieut. Col., Corps of Engineers, District Engineer.

[fol. 4211] DEFENDANTS' EXHIBIT No. 115

Theoretical Efficiencies of the Tennessee River Waterway

Low Dam Development

Item	Time Consumed (Hours)	Theoretical Time (Hours)	Time Lost (Hours)	Efficiency Loss %
Lockages	37.5	0	37.5	10.3
Running upstream	185.0	117.8	67.2	18.5
Running downstream	107.9	117.7	−9.8	−2.7
Miscellaneous delays	33.0	0	33.0	9.1
Total	363.4	235.5	127.9	35.2

Net efficiency—64.8%.

High Dam Development

Item	Time Consumed (Hours)	Theoretical Time (Hours)	Time Lost (Hours)	Efficiency Loss %
Lockages	13.5	0	13.5	4.7
Running upstream	129.5	117.8	11.7	4.1
Running downstream	115.6	117.7	−2.1	−0.7
Miscellaneous delays	25.9	0	25.9	9.1
Total	284.5	235.5	49.0	17.2

Net efficiency—82.8%.

Note.—The above calculations refer to a round trip, Paducah, Ky., to Knoxville, Tenn., and return. The lockage times are calculated on the basis of single lockages. The upstream running times are based on a still water towing speed of 5.5 m.p.h. minus current velocities of 2 m.p.h. with the low dams and minus 0.5 m.p.h. with the high dams. The downstream running times are based on a still water towing speed of 5.5 m.p.h. plus one-fourth of the current velocities. Miscellaneous delays are taken as 10% of the sum of the other three items.

ESTIMATE OF TONNAGE MOVEMENT ON TENNESSEE RIVER FOR 1937 ASSUMING COMPLETE NAVIGATION FACILITIES

Note: (a) This estimate is based on present tonnage potentialities and makes no allowance for future growth of traffic.

(b) This estimate is confined to specific tonnage movements from or to points on or near the Tennessee River, concerning which definite information was obtained from shippers or receivers. It does not cover all probable commodities, nor all possible shipping and receiving points in the territory contiguous to the Tennessee Valley. For example, movements to and from Atlanta, Georgia, and district are not included.

(Movements Shown in Tons of 2000 Pounds)

Commodity	Annual Inbound Movement	Annual Outbound Movement[1]	Annual Movements Inbound & Outbound	Annual Savings by Use of Water Transportation	Average Savings per Ton by Use of Water Transportation
Agricultural Implements	4,800	3,000	7,800	$ 20,358.00	$2.61
Aluminum & Bauxite Ore Concentrates	18,000	5,000	23,000	25,160.00	1.09

4144

gasoline will be consumed annually. The total domestic demand for all gasoline and kerosene, tax paid as well as non-taxable, is about 114% of the tax-paid gasoline consumed in the U.S.[3] The consumption of all gasoline and kerosene in the Tennessee Valley area may thus be considered to approximate 745,000 tons a year on above basis.

The estimate that 505,000 tons of gasoline and kerosene will move into the Tennessee Valley by water is a reasonable one when it is considered that approximately 745,000 tons of gasoline and kerosene is necessary to satisfy the needs of the Valley in a year, at the present automobile registration. Also, the figure is reasonable when the 1937 tonnage of gasoline and kerosene that moves on the Cumberland River is considered, approximately 266,000 tons. (This is an indicated figure based on the first eight months of 1937.[4]) The improved portion of the Cumberland is only about one-third the length of the Tennessee River.

There are possibilities that much more gasoline would move into the Tennessee Valley by water if pipe lines such as one from Chattanooga to Atlanta were constructed. Further increase in the amount of petroleum products distributed may arise from distribution when terminals on the Tennessee River serve a much wider area than is now foreseen. Much of the gasoline moving to Tennessee River terminals might compete with such products moving in from Atlantic Coast ports at the present time.

DEFENDANTS' EXHIBIT NO. 131

GASOLINE AND KEROSENE

Basic Information

Tax paid gasoline used per automobile is 660 gallons a year,[1] average for the Tennessee Valley states. Automobile registrations for the Tennessee Valley area were approximately 265,000 in 1934,[2] plus 15%, the amount of increase in the seven southeastern states in automobile registrations since 1934. Thus there are about 300,000 automobiles for which 650,000 tons of tax paid gasoline will be consumed annually. The total domestic demand for all gasoline and kerosene, tax paid as well as non-taxable, is about 114% of the tax-paid gasoline consumed in the U.S.[3] The consumption of all gasoline and kerosene in the Tennessee Valley area may thus be considered to approximate 745,000 tons a year on above basis.

The estimate that 505,000 tons of gasoline and kerosene will move into the Tennessee Valley by water is a reasonable one when it is considered that approximately 745,000 tons of gasoline and kerosene is necessary to satisfy the needs of the Valley in a year, at the present automobile registration. Also, the figure is reasonable when the 1937 tonnage of gasoline and kerosene that moves on the Cumberland River is considered, approximately 260,000 tons. (This is an indicated figure based on the first eight months of 1937.[4]) The improved portion of the Cumberland is only about one-third the length of the Tennessee River.

There are possibilities that much more gasoline would move into the Tennessee Valley by water if pipe lines such as one from Chattanooga to Atlanta were constructed. Further increase in the amount of petroleum products distributed may arise from distribution when terminals on the Tennessee River serve a much wider area than is now foreseen. Much of the gasoline moving to Tennessee River terminals might compete with such products moving in from Atlantic Coast ports at the present time.

[fol. 4260] DEFENDANTS' EXHIBIT No. 135

Stipulation

It is hereby stipulated and agreed by and between the parties hereto, by their respective solicitors, as follows:

1. For the purposes of this proceeding only, and without prejudice to any other suit or proceeding between the parties hereto, or otherwise, the facts contained in this stipulation and in the exhibits filed herewith, shall have the same force and effect as though offered and received in this proceeding as the testimony of competent witnesses, or as competent documents.

2. None of the parties, by entering into this stipulation, shall be deemed to have conceded the relevancy or materiality of any fact herein contained and no objection shall be required to be entered on the record to preserve the right of any party to question such relevancy or materiality at any stage of the proceeding.

3. Over eighty-five per cent (85%) of the voting stock of the complainants Memphis Power and Light Company, the Birmingham Electric Company, the Carolina Power and Light Company, the Holston River Electric Company, the Tennessee Public Service Company, the West Tennessee Power & Light Company, is owned by the National Power & Light Company. One hundred per cent (100%) of the voting stock of the complainant Appalachian Electric Power Company is owned by the American Gas & Electric Company, and the complainant Appalachian Electric Company in turn owns one hundred per cent (100%) of the voting stock of complainants Kingsport Utilities, Inc., and Kentucky and West Virginia Power Companies. Approximately ninety-four per cent (94%) of the voting stock of the complainant Mississippi Power & Light Company is owned by the Electric Power & Light Corporation.

4. The Electric Bond & Share Corporation, a New York corporation having its principal place of business at 2 Rector Street, New York City, owns a substantial share of the outstanding securities of the American Gas & Electric Company, the National Power & Light Company, and Electric Power & Light Corporation heretofore described as owning a substantial share of the outstanding securities of certain of the complainants.

DEFENDANTS' EXHIBIT No. 135

5. The following is a precise description of the affiliations through stock ownership described in paragraphs 3 and 4.

A. The Electric Bond & Share Company owns approximately the following voting securities of the American Gas & Electric Company, the National Power & Light Company, and the Electric Power & Light Company which represent approximately the following percentages of the total outstanding voting securities of each of said companies:

[fol. 4261]

Company and Class of Stock	Number of Shares Held	Percentages of Outstanding Voting Securities
American Gas:		
Common Stock	846,935	17.51%
National Company:		
Common Stock	2,540,438	46.56%
Electric Company:		
$7 Preferred Stock	485	47.20%
Common Stock	1,976,638	

B. American Gas & Electric Company owns all of the outstanding securities, other than directors' qualifying shares, if any, of the following complainants. Said complainants, in turn, own outstanding voting securities of the complainants named under them, which represent the percentages of the total outstanding voting securities of said companies, which are complainants, set forth opposite their respective names:

(1) Appalachian Electric Power Company:
  (a) Kentucky & West Virginia Power Company 100%
  (b) Kingsport Utilities, Inc. 100%

C. The National Power & Light Company owns outstanding voting securities of the following complainants which represent the percentages of the total outstanding voting securities of said companies, which are complainants, set opposite their respective names:

(1) Birmingham Electric Company 100.00%
(2) Carolina Power & Light Company 93.53%

(3) Holston River Electric Company	100.00%
(4) Memphis Power & Light Company	86.75%
(5) Tennessee Public Service Company	99.31%
(6) West Tennessee Power & Light Company	100.00%

D. The Electric Power & Light Company owns 94.03 per cent of the voting shares of the complainant Mississippi Power & Light Company.

6. The charts attached to the stipulation as Exhibit A are a reasonably accurate description of the stock ownership heretofore described.

7. The Electric Bond & Share Company has owned and now owns approximately the percentages of the total outstanding voting securities of the American Gas & Electric Company, Electric Power & Light Company and National Power & Light Company hereinbefore stated. Stockholders' meetings of such companies have been held annually since their organization, and occasionally special meetings have been called for the approval of security issues, agreements or consolidations and similar matters requiring stockholders' approvals. Calls or notices and proxies for those meetings were authorized by the respective boards of directors of these companies and the personnel of the proxies were suggested to such directors by the respective officers of such companies. The respective secretaries of these companies sent out such notices and proxies. At the stockholders' meetings of these companies, Bond and Share has voted the stocks of such companies [fol. 4262] owned by it through the proxies designated as above described. Exhibit B, consists of tables showing, for the past five years, the number of shares voted in person and by proxy at the stockholders' meetings of these companies and the number of shares voted by Bond and Share. During such years, Bond and Share has voted the following approximate percentages of the total number of shares of stock represented at such meetings: National Company, 62%, Electric Company, 77%, American Gas & Electric Company, 25%. Throughout the history of the companies, there has been no instance in which there has been any contest over proxies or in which any interests hostile to the respective managements have organized opposition to the

programs or policies of the respective managements or to the election of directors voted for by proxies designated by such managements.

8. The Commonwealth & Southern Corporation owns one hundred per cent (100%) of the outstanding voting securities of the original complainants, Georgia Power Company, Alabama Power Company, and Mississippi Power Company and approximately ninety-nine per cent (99%) of the total outstanding voting securities of the complainant Tennessee Electric Power Company.

One hundred per cent of the shares of the Southern Tennessee Power Company are owned by the Commonwealth & Southern Corporation.

Baker, Hostetler, Sidlo & Patterson, Trabue, Hume & Armistead, Frantz, McConnell & Seymour, by Charles D. Snepp, Solicitors for Complainants.
John Lord O'Brien, Solicitor for Defendants.

HHF:DD:MC.

[fol. 4263] Amendment to Stipulation of September 14, 1937

It is agreed that the stipulation filed in this cause on August —, 1937, be amended by striking therefrom all of Section 8 thereof and inserting in lieu of said Section 8 *thereof and inserting in lieu of said Section 8* the following:

"8. The Commonwealth & Southern Corporation owns 100% of the Common Stock of the original complainants Alabama Power Company, Georgia Power Company and Mississippi Power Company and approximately 99% of the total outstanding Common Stock of the complainant The Tennessee Electric Power Company and considering also the preferred stocks of said companies which have voting power, owns voting securities which represent the following percentages of the total outstanding voting securities of each of said companies as follows:

"Alabama Power Company	91.40%
"Georgia Power Company	100%
"Mississippi Power Company	100%
"The Tennessee Electric Power Company	64.43"

DEFENDANTS' EXHIBIT No. 135

"100% of the shares of the Southern Tennessee Power Company are owned by The Commonwealth & Southern Corporation."

[fol. 4264] DEFENDANTS' EXHIBIT No. 136

Stipulation

It is hereby stipulated and agreed by and between the parties hereto, by their respective solicitors, as follows:

1. That the map attached hereto as Exhibit A, designated "Lines and Substations of the Tennessee Valley Authority in Service, under Construction, and Authorized," represents accurately all the transmission lines, rural lines, and substations of the Authority as of October 15, 1937.

2. That the table attached hereto as Exhibit B, entitled "Transmission Lines of Tennessee Valley Authority," correctly states the facts shown thereon.

3. That the table attached hereto as Exhibit C, entitled "Substations of Tennessee Valley Authority," correctly states the facts shown thereon.

4. That the map attached hereto as Exhibit D, designated "Rural Lines Owned by Municipalities and Cooperatives Purchasing Power from TVA and Rural Lines Owned by TVA," is an accurate representation as of October 15, 1937, of the rural lines owned by the municipalities and cooperative associations purchasing power from the Authority (except the North Georgia Electric Membership Corporation) and the rural lines owned by the Authority.

5. That the tables attached hereto as Exhibit E, entitled "Rural Lines Owned by Municipalities and Cooperatives and Rural Lines Owned by TVA," correctly state the facts shown thereon.

Each of the parties specifically reserves the right to object to the introduction of any of the facts stipulated above on the ground of materiality or relevance.

Charles M. Seymour, Solicitors for Complainants.
John Lord O'Brien, Solicitors for Defendants.

Defendants' Exhibit No. 136

Note:

Exhibit "A" to Defendants' Exhibit No. 136 is the same as Defendants' Exhibit No. 136A.

Exhibit "D" to Defendants' Exhibit No. 136 is the same as Defendants' Exhibit No. 136B.

Summary

Total miles of line purchased by TVA and sold to Municipalities or cooperatives	289
Total miles of line purchased by TVA—Direct Operations	68
Total miles of line financed and constructed by TVA—Direct Operations	561.7
Total miles of line constructed by Municipality or Cooperatives	292
Total miles of line financed and constructed by TVA and sold to Municipalities or Cooperatives	1,023
Total miles of line constructed by TVA under contract with Municipalities or Cooperatives	1,343
Grand Total	3,576.7*

Note: Of the total mileage shown aggregating 3,576.7* miles, approximately 490* miles were under construction as of October 15, 1937.

* Exclusive of rural lines owned by North Georgia Electric Membership Corporation.

Note: D.S.F.—Day-second-feet. A discharge of one day-second-foot is equal to a discharge of one cubic foot of water per second for twenty-four hours. The monthly totals are the aggregate amounts of water discharged in a month in day-second-feet.

* That part of the total discharge below the dam which could have been passed through the turbines if operated to full capacity, or to the extent permitted by the amount of the releases if such releases were not adequate to operate the turbines at full capacity, at the time water was released.

** The first water released from Norris Reservoir was on June 19, 1936. The first generating unit was placed in operation on July 28, 1936 and the second generating unit was placed in operation on September 30, 1936.

*** The first generating unit at Wheeler Dam was placed in operation on November 9, 1936. The November data shown are from November 9 through 30. The second generating unit was placed in operation on April 14, 1937.

$ Serves territory within "ceded" areas in Mississippi or Alabama described in contract of January 4, 1934.

$$ Service initiated under 2500 kw. clause of contract of January 4, 1934.

$$$ Wholesale power supply purchased at City Gate, in Athens, Alabama, from Alabama Power Company; in Dayton, Tennessee, from a local lumber mill; and in Tupelo, Mississippi, from Mississippi Power Company. Industrial customers in Athens and Tupelo with a load over 25 horsepower were served directly by Alabama Power Company and Mississippi Power Company, respectively.

* Date in parenthesis is date of existing contract superseding original contract.

** Date in parenthesis is date of contract modifying or supplementing original contract.

*** Power purchased from the Authority under the earlier contract has been used by the city in replacement of power previously generated by municipally owned generators and used only for municipal water pumping, street lighting, and other municipal uses. The later contract covers a power supply for both municipal purposes and resale.

x Retail service by Mississippi Power Co. or Alabama Power Co. prior to transfer of property to Authority under contract of January 4, 1934.

[fol. 4284] DEFENDANTS' EXHIBIT No. 143A

Press Release, Morning Papers, Jan. 5 1934

Tennessee Valley Authority,
New Sprankle Building,
Knoxville, Tennessee

Contract

This contract, made and entered into this 4th of January, 1934, between Tennessee Valley Authority, a corporation organized and existing under and by virtue of the Tennessee Valley Authority Act of 1933, hereinafter called Authority, and Commonwealth & Southern Corporation, a corporation organized and existing under the laws of the State of Delaware, hereinafter called Commonwealth Company; Alabama Power Company, a corporation organized and existing under the laws of the State of Alabama, hereinafter called Alabama Company, Tennessee Electric Power Company, a corporation organized and existing under the laws of the State of Maryland, hereinafter called Tennessee Company, Georgia Power Company, a corporation organized and existing under the laws of the State of Georgia, hereinafter called Georgia Company, and Mississippi Power Company, a corporation organized and existing under the laws of the State of Maine, hereinafter called Mississippi Company, the Alabama Company, Tennessee Company, Georgia Company and Mississippi Company to be hereinafter collectively designated as Power Companies,

Witnesseth:

Whereas, Power Companies, all of which are subsidiaries of commonwealth Company, and Authority, for the mutual benefit of the respective power systems of Power Companies and Authority, desire to enter into an agreement for the interchange of electric power and for certain switching and other services in connection with such interchange as hereinafter specifically set forth; and

Whereas, the electrical system of all Power Companies are interconnected and the interchange arrangement hereinafter agreed upon will benefit each of said Power Com-

panies whether or not any interchange is made directly with each of said companies; and

Whereas, Alabama Company, Tennessee Company and Mississippi Company desire to sell, and Authority desires to purchase, certain land, buildings and physical properties devoted to the generation, transmission and distribution of electricity, together with certain franchises, contracts and going business as herein specifically set forth; and

Whereas, the parties desire to enter into certain other and further covenants, as herein specifically enumerated:

Now, Therefore, in consideration of the covenants herein mutually entered into, the parties hereto covenant and agree as follows:

1. Mississippi Company covenants and agrees to convey to Authority, its nominee or nominees, promptly upon the execution of this contract, all of its transmission and distribution lines, substations, generating plants and other property (except one certain dam site in Tishomingo County, State of Mississippi, on the Tennessee River) used in connection with the generation, transmission, distribution or sale of electrical energy by it in the Counties of Pontotoc, Lee, Itawamba, Union, Benton, Tippah, Prentiss, Tishomingo and Alcorn in the State of Mississippi, said property being more particularly described in Exhibit A attached hereto and hereby made a part thereof. Authority agrees to pay for such properties on the date of delivery thereof the sum of eight hundred and fifty thousand dollars ($850,000).

2. Alabama Company covenants and agrees to convey to Authority, its nominee or nominees, immediately upon request, and from time to time as requested, any or all of its low tension (44 kv. or lower) transmission lines, sub- [fol. 4285] stations (including the high tension station at Decatur and the Sheffield steam plant station) and all rural lines and rural distribution systems in the Counties of Lauderdale, Colbert, Lawrence, Limestone, Morgan (excluding the Hulaco area), north half of Franklin (including the town of Red Bay), and the territory in the northern part of Cullman served by a certain line of Alabama Company extending south from Decatur, all in the State of Alabama, said property being more particularly described

in Exhibit B, attached hereto and hereby made a part hereof. Authority covenants and agrees that when it has taken all of such properties it will pay therefor an aggregate sum of one million dollars ($1,000,000). Alabama Company further agrees promptly upon the execution of this contract to convey to Authority, its nominee or nominees, all of the real property which it owns within and adjacent to the area known as the Joe Wheeler dam site in the Counties of Lawrence and Lauderdale, in the State of Alabama, said property being more particularly described in Exhibit C, attached hereto and hereby made a part hereof. Authority covenants and agrees to pay an aggregate sum of one hundred and fifty thousand dollars ($150,000) for such properties. Authority agrees to pay for such properties on the respective dates of delivery thereof at 60.17448% of the respective prices shown for such properties in said Exhibit B, and at 51.81257% of the respective prices shown for such properties in Exhibit C.

3. Tennessee Company covenants and agrees to convey to Authority, its nominee or nominees, immediately upon request, and from time to time as requested, any or all of its transmission and distribution lines, sub-stations, distribution systems and other properties used in connection with the transmission, distribution and sale of electrical energy by it in the Counties of Anderson, Campbell, Morgan (except the lines extending into Morgan County from Harriman), Scott and the west portion of Claiborne, and all of the 66 kv. transmission line from Cove Creek to Knoxville in Knox County, all in the State of Tennessee, being more particularly described in Exhibit D, attached hereto and hereby made a part hereof. Authority agrees to pay for such properties on the respective dates of delivery thereof at 65.91702% of the respective prices shown for such properties in said Exhibit D. Authority covenants and agrees that if and when it takes all of such properties it will pay therefor an aggregate sum of nine hundred thousand ($900,000) dollars.

4. Power Companies severally covenant and agree that the properties which by this contract they agree to convey to Authority, its nominee or nominees, shall be conveyed free of liens or other encumbrances, except such liens or

encumbrances as may be specifically recited in the respective exhibits, title being subject to approval of counsel for Authority; and Power Companies severally covenant and agreed to secure any necessary waiver of liens or encumbrances created by any security issue authorized and/or outstanding against the property which they agree to convey. All conveyances by Power Companies shall be by general warranty deed, and title shall be subject only to the liens or encumbrances recited in said exhibits; Provided, however, that Power Companies shall not be required to warrant easements or rights-of-way assigned or transferred hereunder, other than that they validly hold and exercise such easements or rights-of-way, and are free to transfer same to Authority. Any conveyance of property shall include not only the physical property, easements and rights-of-way, but shall also include all machinery, equipment, tools and working supplies set forth in the respective exhibits, and all franchises, contracts and going business relating to the use of any of said properties, without extra charge. Power Companies severally covenant and agree to transfer or secure the transfer of said franchises, contracts and going business, and to transfer said properties with all present customers attached, so far as they are able. Power Companies severally covenant and agree that pending the transfer of any properties to Authority as herein provided, they will maintain such properties in good condition, and expend for such maintenance the amounts normally allowed therefor in their respective budgets.

[fol. 4286] 5. Alabama Company covenants and agrees to convey its urban distribution systems in the above named counties in Alabama, said distribution systems being listed in Exhibit B, to the respective municipalities in or adjacent to which such systems are located, together with all franchises, contract rights, and going business thereto appertaining, when it has agreed with any such municipality on the price to be paid for the same. Alabama Company agrees to make every reasonable effort to come to an early agreement with said municipalities for such sales. In the event that any such municipality is unable to arrive at a satisfactory price after three months of bona fide negotiation with Alabama Company, or if for some other reason the sale of any such system cannot be consummated, Au-

thority shall have the right to serve such municipality or municipalities irrespective of whether such municipalities have purchased the distribution systems from Alabama Company. Authority covenants and agrees to use its best endeavors to assist in bringing about the purchase of such distribution systems by the respective municipalities at fair prices.

If Authority elects to purchase said transmission systems in said areas prior to the purchase by municipalities of said distribution systems, then Authority agrees to exchange with Alabama Company sufficient electric energy to supply said distribution systems.

6. Tennessee Company covenants and agrees as to any municipal distribution systems in the above named Counties in Tennessee which Authority does not elect to purchase, Tennessee Company will convey such distribution systems to the municipalities in or adjacent to which such systems are located, together with all franchises, contract rights and going business thereto appertaining when it has agreed with any such municipality on the price to be paid for same. Tennessee Company agrees to make every reasonable effort to come to an agreement with said municipalities for such sales. In the event any such municipality is unable to arrive at a satisfactory price after three months of bona fide negotiation with Tennessee Company, or if for some other reason the sale of any such system cannot be consummated, Authority shall have the right to serve such municipality or municipalities irrespective of whether such municipalities have purchased the distribution systems from Tennessee Company. Authority covenants and agrees as to any of said distribution systems which it does not purchase to use its best endeavors to assist in bringing about the purchase of such distribution systems by the respective municipalities at fair prices.

If Authority elects to purchase said transmission systems in said areas prior to the purchase by municipalities of said distribution systems, then Authority agrees to exchange with Tennessee Company sufficient electrical energy to supply said distribution systems.

7. Power Companies covenant and agree that during the period of this contract none of said companies will sell elec-

tric energy to any municipality, corporation, partnership, association or individual in any portion of the above-described counties or parts thereof in Alabama, Tennessee and Mississippi, in which portions the properties of Power Companies listed in the respective schedules attached hereto have been transferred out of Power Companies in accordance with this contract or in which Power Companies at the time of entering into this contract do not own such properties. During said period Authority will not sell electric energy outside of said counties to any municipality, corporation, partnership, association or individual which, or the distribution system serving which, is now supplied by Power Companies, nor will Authority sell electric energy outside of said counties to the customers of non-utilities supplied by Power Companies; Provided, however, that nothing herein contained shall be construed to prevent Authority from selling electric energy outside of said counties to any municipality or municipalities which, or the distribution system serving which, is not on the date of the [fol. 4287] execution of this agreement being served by Power Companies; and Provided, further, that distribution systems having interchange contracts with Power Companies, or supplied by companies or systems having interchange contracts with Power Companies, shall not within the meaning of this contract be considered as being supplied with electricity by Power Companies, except that Authority shall not have the right to interchange power with any utility operating under an interchange contract with Power Companies; and Provided, further, that nothing herein contained shall be construed to prevent Authority from selling electric energy to rural consumers or organizations thereof, in the counties of Rhea, Roane, Meigs and the western part of McMinn on the so-called plateau, in the State of Tennessee, not now being served by Tennessee Company, and to rural consumers or organizations thereof in Monroe County in the State of Mississippi not now being served by Mississippi Company; and Provided, further, that Authority may serve electric energy to any fertilizer plant or other industry operated by it, without any restriction as to the location thereof; and Provided, further, that in addition to the above described exceptions nothing in this contract shall be construed to prevent Au-

thority from selling, outside of the five counties or parts thereof above named and the counties named in Sections 1, 2 and 3 of this contract, electric energy up to a total demand of 2500 kw. to customers not at the time served by Power Companies.

8. As a part of the interchange arrangements provided for by this contract, Authority agrees to deliver to Power Companies on demand, at points hereinafter described, all of its surplus hydro-electric power, and Authority agrees to supply not less than 20,000 kw., if Power Companies desire that amount, plus the totalized net demand of Authority on Power Companies at the various exchange points hereinafter described, plus fifteen per cent of such totalized net demand for line losses; and Power Companies agree to receive and take such power when, as and to the extent required by them. The term "totalized net demand" as used herein shall be construed to mean the aggregate one hour integrated demand of Authority at all exchange points, less the aggregate one hour integrated demand of Power Companies at all exchange points. The term "surplus hydro-electric power" as used herein shall be construed to mean the excess of available water capacity over Authority's own requirements as such may exist from time to time. The decision as to what constitutes excess capacity at any given time shall be in the discretion of the acting Chief Operating Officer of Authority at Wilson Dam at such time; Provided, however, that nothing herein contained shall be construed as a limitation on the obligation of Authority to supply 20,000 kw. to Power Companies, Authority agrees to supply Power Companies on request all data bearing upon water capacity and Authority's requirements.

9. Authority covenants and agrees to supply power to Power Companies at the following points of exchange, and at such other points as the parties may from time to time agree:

(a) At Wilson Dam on the 154 kv. line connecting Gorgas and Nashville;

(b) At Wilson Dam on the 110 kv. line extending from Wilson Dam to Huntsville at the point where the line crosses the southern boundary of U. S. Nitrate Plant No. 2;

(c) At the point where the 44 kv. line extending from West Point to Tupelo intersects the southern boundary line of Lee County, Mississippi; Provided, however, that Authority shall not be obligated to render service at this point unless and until the line from Tupelo to Wilson Dam is constructed by Authority.

(d) At such other points as may be necessary to comply with the obligations of Authority under this contract to supply distribution systems operated by Power Companies.

[fol. 4288] 10. Power Companies covenant and agree to supply power to Authority at the following points of exchange:

(a) At Wilson Dam on the 154 kv. line connecting Gorgas and Nashville;

(b) At Wilson Dam on the 110 kv. line extending from Wilson Dam to Huntsville at the point where the line crosses the southern boundary of U. S. Nitrate Plant No. 2;

(c) At the point where the 44 kv. line extending from West Point to Tupelo intersects the southern boundary line of Lee County, Mississippi;

(d) At the point where the high-tension substation at Decatur, Alabama, joins the 110 kv. line of the Alabama Company extending from Sheffield to Huntsville;

(e) At or near the point on the 44 kv. line between Huntsville and Decatur where the line crosses the boundary of Limestone and Madison Counties, Alabama;

(f) At a point on the 120 kv. line of the Tennessee Company at or near Cove Creek, Tennessee;

(g) At a point on the 154 kv. line connecting Wilson Dam and Nashville at or near Mount Pleasant, Tennessee;

(h) At such other points on the lines of Power Companies as Authority may from time to time designate for service to any customer which Authority may serve under Section 7 of this contract; Provided, however, that Authority shall pay the whole cost of such additional connections; and Provided, further, that Power Companies shall be under no obligation to render service to an amount in excess of the surplus transmission capacity of the respec-

tive lines except that Authority may, solely at its own expense, advance funds to the respective Power Companies for increasing the transmission capacity of said lines and that upon being advanced the funds Power Companies shall be obligated to make such increase in transmission capacity; and Provided, further, that Authority shall not have the right under this sub-paragraph to designate any exchange points outside of the Tennessee Valley Basin. Power Companies shall retain title to all improvements thus financed on said lines; Provided, however, that should Authority purchase said lines, the net increase in value because of such improvements shall be deducted from the purchase price.

11. Power Companies covenant and agree that after the expiration of this agreement the interchange arrangement then in effect will be maintained by Power Companies for an additional period (not exceeding eighteen months) sufficient to permit Authority to construct its own transmission facilities for serving all of the territory which it is then serving in whole or in part with power obtained at such interchange points.

12. The cost of installing the necessary apparatus for the exchange of power at Wilson Dam shall be borne in equal part by Authority and Alabama Company. The cost of installation of additional interchange facilities at the remaining points shall be borne by Authority. The cost of operation and maintenance of the interchange facilities at the interchange points described in Section 9 and in subparagraphs (a) to (g), inclusive, of Section 10 hereof, shall be borne equally by Authority and the respective Power Company directly involved, and such operation and maintenance shall be under the general control and direction of Authority and said such Power Company, and shall be effected through joint employees whose compensation shall be equally borne. No such employee shall be continued in service if objected to by either party. The cost and control of the operation and maintenance of the additional [fol. 4289] points of exchange, provided for by Section 10 (h), shall be governed in the same manner except that Authority shall reimburse Power Company for its share of such cost of operation and maintenance.

13. Power Companies agree to have available at all times for exchange, at each point of exchange, energy and capacity to supply the entire demands of the customers served by Authority from such points of exchange, subject to the limitations as to transmission capacity set forth in Section 10 (h) hereof; Provided, that the maximum amount which Authority shall be entitled to demand at all points of exchange shall be 70,000 kv.

14. In the computation of the obligations for energy interchanged under the terms of this contract, and in the settlements therefor, Power Companies shall act and be treated jointly, through an agent of their own selection, hereinafter called Agent; and Power Companies covenant and agree to select such an agent promptly upon the execution of this contract, and promptly to notify Authority of their selection in writing. Power Companies may jointly designate a new agent from time to time, upon giving Authority three calendar months notice in writing; and such new agent shall succeed to all the rights, duties and obligations of its predecessor. Power Companies hereby waive all recourse against Authority, except through such agent. Power Companies and Commonwealth Company shall, however, be jointly and severally liable for all obligations hereunder pertaining to said interchange arrangements, the establishment and maintenance of exchange points, the amount of energy or capacity to be made available at such points, and the settlement of obligations created thereby, including the payment of quarterly settlements provided for in Section 15, and the monthly payment provided for in Section 16 hereof.

15. Computation of the obligations for energy interchanged under the terms of this contract shall be made on the following basis. Statements shall be rendered to each other by Agent and Authority quarterly. The first statement shall be rendered within ten days after March 31, 1934, for the period beginning with the date of execution of this contract and extending to and including March 31, 1934. Similar statements shall be rendered within ten days after the close of the quarterly calendar periods dating from March 31st thereafter. The statements shall show the amount of energy exchanged at each exchange point

plus 15 per cent for line losses on the transmission thereof from the point of generation; Provided, however, that line losses shall not be considered in the determination of the amount due Authority for the delivery of energy to Power Companies at the point of generation. Statements shall be computed as per the following example, viz.:

(1) Kilowatt Hours Received by Power Companies from Authority at the point of generation		30,000,000 kwh.
(2) Kilowatt Hours Received by Power Companies from Authority at exchange points other than the point of generation	8,000,000 kwh.	
Add 15% for line losses	1,200,000 kwh.	9,200,000 kwh.
Total Received by Power Companies		39,200,000 kwh.
(3) Kilowatt Hours Received by Authority from Power Companies at exchange points	20,000,000 kwh.	
Add 15% for line losses	3,000,000 kwh.	23,000,000 kwh.
Difference (2) and (3)		16,200,000 kwh.

[fol. 4290] and the excess of energy delivered by Power Companies (considered as a unit) to Authority and vice versa, shall be paid for by Agent or Authority, as the case may be, within twenty days after March 31, 1934, or of the close of subsequent quarterly periods as the case may be The party receiving such excess of energy over the energy delivered in exchange during such period shall pay therefor at the following rates:

First 300,000 Kilowatt Hours per period at 3.6 mills per kwh.

Next 600,000 Kilowatt Hours per period at 2.7 mills per kwh.

Next 2,100,000 Kilowatt Hours per period at 2.25 mills per kwh.

Next 18,600,000 Kilowatt Hours per period at 1.8 mills per kwh.

Next 21,600,000 Kilowatt Hours per period at 1.35 mills per kwh.

Excess Kilowatt Hours per period at 1.08 mills per kwh.

16. In addition to the energy payments hereinbefore provided, Agent agrees to pay monthly to Authority $16,200

(1) for the reservation by Authority for the use of Power Companies of the 20,000 kw. of capacity as hereinbefore provided, (2) for the use of the 154 kv. line of Authority on the reservation at Wilson Dam, (3) for the use of other property of Authority required for the interchange of power, (4) and to cover the expense of the switching and voltage regulation by Authority necessary to synchronize its operations with the operations of Power Companies.

17. Tennessee Company agrees to file with the Railroad and Public Utilities Commission of Tennessee, simultaneously with the execution of this contract, schedules of domestic service rates, as follows:

Metered Residential Service

Alternating Current, Single Phase Applicable to any residential service installation located on the Tennessee Electric Power Company's existing alternating current single phase distribution lines within the State of Tennessee

Energy Charge—Net

New "Immediate" Rate		New "Promotional" Rate	
6.5¢ per kwh.	first 25 kwh.	$1.00 per mnth.	incl. 15 kwh. per mnth.
5¢ " "	next 85 "	4.5¢ " kwh.	next 50 "
3¢ " "	next 140 "	2¢ " "	next 135 "
1.5¢ " "	over 200 "	1¼¢ " "	next 500 "
		1¢ " "	over 700 "

Minimum Bill—$1.00 per month.

Procedure in Applying New "Immediate" and New "Promotional" Rates

A base bill will be established for each customer as follows:

[fol. 4291] A—For Existing Customers:

The base bill will be the kwh. use for the same month of the year preceding the effective date of the new rates, computed under the new "Immediate" rate.

B—For New Customers:

The base bills for new customers and for those taken on during the 12 months preceding the effective date of the

new rates will be their first 12 months use computed under the new "Immediate" rate.

Whenever the customer's bill under the new "Immediate" rate is equal to or less than his base bill, the new "Immediate" rate will apply.

Whenever the customer's bill under the new "Promotional" rate is greater than his base bill, the new "Promotional" rate will apply.

Whenever the customer's bill under the new "Immediate" rate will be greater than his base bill but under the new "Promotional" rate will be less than his base bill, the customer will be billed the base bill. No bill under the new "Promotional" rate will be for less than the base bill and no bill under the new "Immediate" rate will be rendered for an amount greater than the base bill.

At the close of the first 12 months of the application of the new rates, all base bills will be reduced 5%. The resultant base bills will be reduced another 5% at the end of 24 months. At the end of 36 months the new "Immediate" rate will be eliminated and the new "Promotional" rate will apply to every residence customer.

Minimum Charge:

$1.00 per month.

Prompt Payment:

The above are net rates—if bills are not paid within 10 days from the date thereof the gross rate will apply which will be 5% in excess of the above net rates.

Term of Agreement:

From date of connections until disconnected on 30 days written notice of one party to the other or on non payment of bills for service.

18. The parties hereto shall not be liable to each other on account of any interruption of the exchange of power as provided in this contract or any damages resulting therefrom due to strikes, fires, storms, break-downs or other cause beyond their control.

DEFENDANTS' EXHIBIT NO. 143A

19. Power Companies and Commonwealth Company covenant and agree to cooperate in the sale of electrical appliances throughout the entire territory served by Power Companies, and to use their utmost endeavors to cooperate with Authority and with Electric Home and Farm Authority, Inc., to promote the sale of electric appliances throughout the Tennessee Valley States served by them.

[fol. 4292] 20. Compliance by Authority with any direction or requirement of the Tennessee Valley Authority Act of 1933 shall not be construed in any way as a violation of the terms of this agreement, nor shall such compliance be construed or urged as a failure or partial failure of consideration hereunder.

21. This contract shall remain in force and effect from the date of the execution hereof until midnight December 31, 1938, or until three months after the completion of Norris Dam power plant, whichever is earlier. Upon completion of said plant, if before October 1, 1938, Authority shall notify Commonwealth Company of such completion and this contract shall terminate three calendar months after the receipt of such notification.

22. Power Companies covenant and agree promptly upon the request of Authority to apply to the respective state public service commissions and other public bodies whose consent or approval is required by law to make effective the several terms of this contract for such consent or approval, and to prosecute such applications with diligence.

23. This contract is executed in sextuplicate, and shall enure to and be binding upon the successors and assigns of the respective parties hereto.

Transmission and Distribution Lines

State Line—Iuka—Approximately 5 miles of 44 kv. #1 3 strand copper conductors with telephone line.

Iuka—Corinth—Approximately 23.1 miles of 44 kv. transmission line #2 copper conductors and telephone line.

Burnsville—Booneville—Approximately 19.0 miles of 44 kv. transmission line #2 copper conductors and telephone line.

Iuka—Fulton—Approximately 45.5 miles of 22 kv. transmission line with #4 copper and #1/0 A.C.S.R. conductors.

Tupelo—Okolona—Approximately 19.3 miles of 44 kv. transmission line with 3 #2/0 and #2 aluminum conductors.

Booneville—Tupelo—Approximately 33 5 miles of 13.2 kv. transmission line with 3 #2/0 aluminum conductors.

Tupelo—Pontotoc—Approximately 22.0 miles of 13.2 kv. transmission line with 3 #2 aluminum conductors, including rural services.

Pontotoc—Ecru—Approximately 8.5 miles of 13.2 kv. transmission line with 2 #2 aluminum conductors.

Tupelo—Sherman—Approximately 12.6 miles of 13.2 kv. transmission line with #2 aluminum conductors, including services for 15 customers.

Tupelo—Nettleton—Approximately 15 miles of 13.2 kv. transmission line located partially on 44 kv. line from

Defendants' Exhibit No. 143a

Tupelo to Okolona (previously listed) with #2 aluminum conductors.

Myrtle—Hickory Flats—Approximately 9 miles of 13.2 kv. transmission line with #2 aluminum conductors.

Hickory Flats to Blue Mountain—Approximately 9 miles of 13.2 kv. transmission line with #2 aluminum conductors.

Hickory Flats to Potts Camp—Approximately 6.3 miles of 13.2 kv. transmission line with #2 aluminum conductors.

44 Kv. Transmission Lines

44 Kv. Lines	Present Replacement Value 12-1-33	Description
Hobgood to Russellville—Rockwood.....	$85,600	Approximately 16.8 Mi. 2/0 Copper Std. and 8.5 Mi. 1/0 ACSR Pole Cap.
Hobgood to Mississippi State Line.....	156,026	Approximately 28.4 Mi. #1 Copper Std. 2 Cross Arm
Hobgood to Courtland to Moulton.....	54,400	Approximately 23.3 Mi. #4 Copper Std. 2 Cross Arm
Hobgood to Nitrate Plant #2 and Florence Central Substation.....	66,000	Approximately 5.5 Mi. #1 Copper Std. and 3 Mi. 203200 on ACSR 4/0 and 2/0 copper
Decatur Central Sub. to L. & N. Shops to Flint.....	32,000	Approximately 5.9 Mi. #4 Copper and 1/0 ACSR Misc.
Flint to Hartselle.....	20,000	Approximately 7 Mi. #4 copper.
Decatur Central Sub. to Cedar Lake to Madison.....	86,000	Approximately 17 Mi. #4 and #1 Copper and 1/0 ACSR Misc.
Belle Mina to Athens.....	45,000	Approximately 14.5 Mi. #4 Copper Std. 2 Cross Arm.
Total.....	$545,026	

If any of these transmission lines conveyed to the Tennessee Valley Authority are located on the same right-of-way on which are located other lines of the Power Company not transferred under this agreement, such right-of-way shall not be conveyed to the Tennessee Valley Authority, but the Authority shall have the right to operate and maintain the line purchased.

If any of the transmission lines conveyed to the Tennessee Valley Authority carry distribution lines on the structures conveyed, the Company shall have the right to operate and maintain these distribution lines.

If any of the transmission lines conveyed to the Tennessee Valley Authority occupy jointly structures with other transmission lines of the Power Company, the structures are not to be conveyed and the operation and maintenance of structures is to be joint.

Amendatory Contract

This Amendatory Contract, made and entered into this 13th day of February, 1934, between Tennessee Valley Authority, a corporation organized and existing under and by virtue of the Tennessee Valley Authority Act of 1933, hereinafter called Authority, and Commonwealth & Southern Corporation, a corporation organized and existing under the laws of the State of Delaware, hereinafter called Commonwealth Company, Alabama Power Company, a corporation organized and existing under the laws of the State of Alabama, hereinafter called Alabama Company, Tennessee Electric Power Company, a corporation organized and existing under the laws of the State of Maryland, hereinafter called Tennessee Company, Georgia Power Company, a corporation organized and existing under the laws of the State of Georgia, hereinafter called Georgia Company, and Mississippi Power Company, a corporation organized and existing under the laws of the State of Maine, hereinafter called Mississippi Company, the Alabama Company, Tennessee Company, Georgia Company and Mississippi Company to be hereinafter collectively designated as Power Companies,

Witnesseth:

Whereas, the parties hereto, on January 4, 1934, entered into a contract for the purchase and sale of property, the interchange of power, and for other purposes, a copy of said contract being attached hereto and hereby made a part hereof; and

[fol. 4319] Whereas, through a misunderstanding on the part of the draftsman of said contract as to the segregation of the consideration stated for the properties in Alabama purchased and sold, Section 2 of said contract fails to carry out the true and correct intent and agreement of the parties at the time of the execution thereof; and

Whereas, none of the parties hereto has acted or changed its position in reliance upon said errors, and all of said parties are now desirous of correcting the said contract so as to make it embody the true intent and agreement which was originally intended to be expressed thereby:

Now, Therefore, in consideration of the covenants herein mutually entered into, the parties hereto covenant and agree as follows:

DEFENDANTS' EXHIBIT No. 143 B

1. Section 2 of said contract of January 4, 1934, is hereby amended to express the true meaning and intent of the parties thereto as follows:

"2. Alabama Company, covenants and agrees to convey to Authority, its nominee or nominees, immediately upon request, and from time to time as requested, any or all of its low tension (44 kv. or lower) transmission lines, substations (including the high tension station at Decatur and the Sheffield steam plant station) and all rural lines and rural distribution systems in the Counties of Lauderdale, Colbert, Lawrence, Limestone, Morgan (excluding the Julaco area) north half of Franklin (including the town of Red Bay), and the territory in the northern part of Cullman served by a certain Lines of Alabama Company ex-[fol. 4320] tending south from Decatur, all in the State of Alabama, said property being more particularly described in Exhibit B, attached hereto and hereby made a part hereof. Alabama Company further agrees promptly upon the execution of this contract to convey to Authority, its nominee or nominees, all of the real property which it owns within and adjacent to the area known as the Joe Wheeler dam site in the Counties of Lawrence and Lauderdale, in the State of Alabama, said property being more particularly described in Exhibit C, attached hereto and hereby made a part hereof. Authority covenants and agrees that when it has taken all of such properties it will pay therefor an aggregate sum of One Million One Hundred Fifty Thousand ($1,150,000) Dollars. Authority agrees to pay for such properties on the respective dates of delivery thereof as follows:

(1) For the properties shown in Exhibit C, Forty Eight Thousand, Seven Hundred Forty Four ($48,744) Dollars, which is 16.857015% of the price shown for such properties in said Exhibit:

(2) For each of the properties shown in Exhibit B, 66.267509% of the respective price shown for each of such properties in said Exhibit.

2. Except as herein amended, said contract of January 4, 1934, shall be and remain in full force and effect.

3. This amendatory contract is executed in sextuplicate and shall enure to and be binding upon the successors and assigns of the respective parties hereto.

DEFENDANTS' EXHIBIT No. 143 B

[fol. 4322] DEFENDANTS' EXHIBIT No. 144

Power Contract Between Tennessee Valley Authority and Lincoln County Electric Membership Corporation

This Agreement, made and entered into as of the 1st day of December, 1937, but actually executed this 11th day of December, 1937, by and between Tennessee Valley Authority (hereinafter called "Authority"), a corporation created by the Tennessee Valley Authority Act of 1933, its successors and assigns, and Lincoln County Electric Membership Corporation (hereinafter called "Corporation"), a corporation organized, created and existing under and by virtue of the laws of the State of Tennessee.

DEFENDANTS' EXHIBIT No. 144

Witnesseth:

Whereas, Authority, by section 10 of the Tennessee Valley Authority Act of 1933, as amended, is authorized to sell surplus power generated by it and not used in its operations and is directed to give preference to states, counties, municipalities, and cooperative organizations of citizens or farmers, not organized or doing business for profit; and,

Whereas, by section 11 of said act it is provided that the sale of power by Authority shall be primarily for the benefit of the people of the section as a whole and particularly the domestic and rural consumers to whom the power can economically be made available; and

Whereas, Corporation desires to purchase electric power from Authority to be distributed and sold by Corporation to its members, and after investigation by Authority it appears that quantities of power sufficient to meet the requirements of Corporation under the terms of this contract will be available for sale by Authority after all requirements of Authority and of the United States have been fulfilled; and

Whereas, Corporation has been organized under the laws of the State of Tennessee for the purpose of acquiring facilities for the purchase and distribution of electric power to its members at the lowest cost consistent with sound business practice and without profit; and

Whereas, Authority has constructed certain lines for and on behalf of Corporation with the understanding that said lines would be taken over and operated by Corporation as soon as they proved suitable as an operating unit; and

Whereas, said lines were temporarily operated by Authority directly pursuant to agreement labeled "Contract for Collection of Bills and other services," dated October 1, 1935, as extended for a period of one year by supplement dated June 29, 1936, and as further extended by supplement dated June 29, 1937 until January 1, 1938; and

[fol. 4323] Whereas, Corporation has formally signified to Authority its desire to take over and operate said lines and both parties have duly authorized the execution of this agreement,

Now, Therefore, for and in consideration of the premises and of the mutual covenants herein contained (the obligations of Authority being subject to all the provisions of the Tennessee Valley Authority Act of 1933, as amended), the parties hereto mutually covenant and agree as follows:

1. Incorporation of Other Documents.—This contract is executed and shall be construed in connection with a certain "Quitclaim Deed" and "Mortgage" executed between Authority and Corporation on even date herewith, which instruments are attached hereto and hereby made a part hereof.

2. Term of Contract.—This contract shall be effective as of the date of execution hereof and shall continue in effect for twenty (20) years.

3. Power Supply.—Authority will, for the term hereof, supply electricity to Corporation for corporate purposes and for resale. Corporation agrees to purchase from Authority and Authority agrees to supply the entire electricity requirements of Corporation. Should Corporation during the period of this contract desire to increase its purchases in excess of 750 kw., Authority shall deliver such excess upon written demand and after reasonable notice, provided that the requirements of Authority and/or the United States reasonably enable it to do so. Reasonable notice shall be defined as six (6) months after date of demand if the additional requirements are 1500 kw. or less, twelve (12) months after date of demand if the additional requirements are over 3500 kw. but not over 5000 kw., and two (2) years after date of demand if the additional requirements are in excess of 5000 kw. Such electricity shall be delivered in the form of three-phase, alternating current, at approximately 60 cycles per second and approximately 11,950 volts, or at such other voltage as the parties may from time to time agree.

4. Point of Delivery.—The energy to be supplied Corporation hereunder shall be delivered at the metering equipment situated on the low tension side of Authority's substation located on Authority's Athens-Pulaski 44,000 volt transmission line, approximately three (3) miles north of

the Alabama-Tennessee state line on U. S. Highway No. 31, or at such other point as may be mutually agreed upon.

5. Schedule of Rates.—Attached hereto, and hereby made a part hereof, is a "Schedule of Rates and Charges."

(a) Wholesale Rates.—Corporation agrees to pay for the energy supplied by Authority at the rates fixed in Schedule A-1 entitled "Wholesale Power Rate."

(b) Resale Rates.—In order to assure a wide and ample distribution of electricity in the area served by Corporation, Corporation agrees to charge consumers the rates set forth for the several classes thereof in Schedules B-1, B-2, B-3, and B-5 of the said Schedule of Rates and Charges and not to depart therefrom except by agreement of the parties. Additional resale schedules for special classes of consumers or [fol. 4324] special uses of electricity may be added from time to time by agreement of the parties. The term "Contractor" in said schedule shall be construed to mean Corporation. If it should appear that the rates provided for in said resale schedule with the surcharge provided for therein do not produce revenues sufficient to operate and maintain Corporation's electric system on a self-supporting and financially sound basis, then Corporation and Authority shall agree upon, and Corporation shall put into effect, such changes in rates as will provide for the increased revenues necessary to place the system upon such a self-supporting and financially sound basis.

6. Repayment of Indebtedness.—Corporation acknowledges its long term obligation to Authority as of the date of this contract to be One Hundred Eighty-six Thousand, Four Hundred Twenty-nine Dollars and Fifty-seven Cents ($186,429.57) with interest thereon at the rate of three- and one-half per cent (3½%) per annum payable semi-annually. Said amount has been arrived at by deducting from the total cost of the properties conveyed to Corporation by the Quitclaim Deed, executed on even date herewith, being One Hundred Ninety Thousand Five Hundred Twenty-seven Dollars and Forty-two Cents ($190,527.42), the amount of amortization collections made by Authority for and on account of Corporation, pursuant to the Contract for Collection of Bills and Other Services, hereinabove mentioned,

being Six Thousand Fifteen Dollars and Forty-seven Cents ($6,015.47), and adding to the result thereof the amount of accounts receivable, being One Thousand Nine Hundred Seventeen Dollars and Sixty-two Cents ($1,917.62), for electric service to persons during the month of November, 1937, it being hereby agreed that said accounts receivable for said month shall be paid directly to and shall be the property of Corporation. It is hereby expressly recognized and agree that the figures above given are estimates only, subject to final determination, and that the long term obligation of Corporation, as given herein and in the Quitclaim Deed executed in connection herewith, is subject to appropriate adjustment, plus or minus, upon such final determination. Corporation agrees to pay to Authority on account of such long term obligation and any other indebtedness now owing to Authority or hereafter incurred, until such indebtedness shall have been totally repaid,

(a) All amortization charges collected by Corporation as provided in section 7 of this contract;

(b) The total surplus revenues as defined in section 8 of this contract.

All payments due under this agreement shall be made to Authority at its offices at Wilson Dam, Alabama, or at such other place as Authority may from time to time designate. The amount so paid shall be credited to any outstanding accounts of Corporation in Authority's discretion. Failure to make such payments shall constitute a default under the aforesaid Mortgage, and Authority may forthwith at its option declare this contract terminated, and/or exercise all rights and powers granted Authority on the failure of Corporation to perform its obligations and promises to Authority.

[fol. 4325] 7. Amortization Charges.—Corporation agrees to collect the amortization charges provided for in the Schedule of Rates and Charges until all its long term obligations to Authority have been fully discharged. Such charges, when collected, shall be considered trust funds and shall be devoted exclusively to the payment of the obligations of Corporation to Authority.

8. Disposition of Corporation's Revenues.—Corporation, for the purpose of providing reasonable rates for electric service pursuant to this contract and to law, agrees to dispose of its gross revenues (not including amortization charges, which shall be disposed of as hereinbefore provided) in the following manner:

(a) Revenues shall first be used for the payment of all current operating expenses, including salaries, wages, cost of materials, and supplies, power at wholesale and insurance;

(b) From remaining revenues Corporation shall next currently provide for the payment, at maturity, of interest on all bonds or other indebtedness applicable to Corporation's electric system, and for amortization charges on all such bonds or other indebtedness and/or sinking fund payments thereon;

(c) Thereafter revenues shall be used currently to set up reasonable reserves for replacements, new construction, and for contingencies, and to provide a reasonable amount of cash working capital. As further security of Corporation's indebtness to Authority, Corporation agrees that Authority may in its discretion fix the maximum amounts for the reserves and funds herein authorized to be set up and may direct the investment or disposition of such reserves and funds.

(d) After the payment or setting up of the above amounts, all remaining revenues shall be considered surplus revenues and shall be paid over to Authority in the manner prescribed above until Corporation's indebtedness to Authority on account of property purchased from Authority shall be satisfied.

(e) After the satisfaction of the indebtedness to Authority all the surplus revenues shall serve as a basis for the reduction or elimination of amortization charges or surcharges to consumers, and thereafter for the reduction of rates.

Surplus revenues shall be computed as of June 30 of each year.

9. Terms and Conditions.—Attached hereto, and hereby made a part hereof, is a schedule entitled "Schedule of

Terms and Conditions." The provisions of this schedule may from time to time be changed or supplemented by agreement of Corporation and Authority. It is understood and agreed that the several provisions of said schedule, with such changes as may from time to time be adopted pursuant thereto, as well as the several provisions of this contract and of the Schedule of Rates and Charges, are of the essence of this contract.

10. Rules and Regulations.—Attached hereto, and made a part hereof, is a Schedule of Rules and Regulations. Corporation hereby adopts said schedule as the rules and regulations of Corporation. The provisions of said schedule may [fol. 4326] be amended by Corporation at any time upon ten (10) days' written notice to Authority setting forth the nature of and the reason for the proposed change. No change shall be made in said schedule, however, which is inconsistent with or in violation of any of the provisions of the remaining part of this contract. In said schedule the term "Distributor" shall be construed to mean Corporation.

11. Rendition of Advisory Services by Authority.—Authority agrees upon request to render advisory services to Corporation in problems of personnel and administration and to secure the attendance of its officers at meetings of the Corporation, its Board or Executive Committee, so far as may be practicable and convenient. Corporation agrees to pay the reasonable value of such advisory services as are rendered by Authority at the request of Corporation. Corporation agrees that it will not employ or retain in its employ any person whom Authority reasonably considers unqualified for his position, or whose services Authority reasonably deems to be unnecessary.

12. Use of Corporation's Lines.—Authority shall have the right, to the extent of the transmission capacity of Corporation's lines, to the use of Corporation's poles and wires for transmission purposes; Provided, however, that Authority shall compensate Corporation for such use by such amounts as may be mutually agreed upon, or by an interchange of electricity, compensating Corporation for line losses, or both; Provided, further, that Authority shall indemnify and save Corporation harmless for any loss, dam-

age, and injury, or other casualty to persons or property caused by Authority's use of such transmission facilities.

13. Construction of Additional Facilities.—Authority will construct for Corporation such additional rural transmission and distribution lines in and adjacent to Lincoln County, Tennessee, as Authority and Corporation may from time to time agree upon and designate. Said lines will be constructed by Authority for and on behalf of Corporation as Corporation's agent. Corporation agrees to pay Authority therefor the actual cost to Authority of constructing such lines, including overheads, with interest on unpaid balances at the rate of three and one-half per cent (3½%) per annum, payable semi-annually. Such obligations shall be considered as a part of the total long term obligation of Corporation to Authority, and payment shall be secured by the Mortgage executed to Authority on even date herewith.

14. Reports to Authority.—Corporation agreees that not later than the first day of September of each year it will render to Authority a complete report, in such form as Authority may prescribe, of the results of its operations for the preceding year ending June 30, the condition of its property, and such other information as Authority may reasonably request. Corporation agrees promptly to render such additional reports and information to Authority as Authority may from time to time reasonably request.

[fol. 4327] 15. Bonding of Employees. — Corporation agrees to bond in a reasonable amount all employees whose duties require or permit them to handle or dispose of money belonging to Corporation.

16. Discrimination.—Corporation agrees that the surplus power purchased hereunder shall be sold and distributed to the ultimate consumer without discrimination between consumers of the same class, and that no discriminatory rate, rebate, or other special concession will be made or given to any customer.

17. Waiver of Defaults.—Any waiver at any time by either party hereto of its rights with respect to any default of the other party hereto and/or with respect to any other matter arising in connection with this contract shall not be

considered a waiver with respect to any subsequent default or matter.

18. Rescission of Prior Agreements.—The Contract for Collection of Bills and Other Services, dated October 1, 1935, is hereby cancelled, annulled, and rescinded, without prejudice, however, to any rights or obligations of the parties hereto which may have accrued thereunder.

19. Contract Not Transferable: Neither this contract nor any interest therein shall be transferable or assignable by Corporation to any other party without the consent of Authority.

In Witness Whereof, the parties hereto have caused this instrument to be signed and attested in duplicate by their duly authorized officers the day and year first above written.

Tennessee Valley Authority, by (S.) John B. Blandford, Jr., General Manager. (Seal.)

Attest: (S.) Charles E. Hoffman, Assistant Secretary.

Lincoln County Electric Membership Corporation, (S.) By D. L. Conger, President. (Seal.)

Attest: (S.) R. D. Cowley, Secretary.

The Schedule of Rates and Regulations, Schedule of Terms and Conditions and Schedule of Rules and Regulations attached to and made a part of this contract are substantially the same as said Schedules attached to and made a part of the contract between TVA and the City of Dickson, Tennessee, (Complainants' Exhibit No. 118).

11. Sales to C & S Companies Expressed as a Percentage of Total TVA System Sales—%	78.73	85.91	84.58	83.42	83.13	88.33	77.28	83.45

* These figures show the generating ability of Wilson Dam in accordance with daily system load requirements by giving preference to any Wilson Dam generation that could have been utilized from spillway discharges in place of actual generation at Norris and Wheeler Dams.

** Norris storage releases are the discharges below Norris Dam less natural flow of Clinch River at the site of Norris Dam.

*** Norris Dam generation included on and after July 28, 1936 and Wheeler Dam generation included on and after November 9, 1936, the respective initial dates of operation.

\# No water was discharged through the spillway gates at Wilson Dam from August 15 through October 4, 1936.

1-1-38

July 28, 1936 to September 30, 1936—234,000 kw. (50,000 kw. at Norris Dam added)
September 30, 1936 to November 9, 1936—284,000 kw. (50,000 kw. at Norris Dam added)
November 9, 1936 to April 14, 1937—316,000 kw. (32,000 kw. at Wheeler Dam added)
April 14, 1937 to date—348,000 kw. (32,000 kw. at Wheeler Dam added)

[fol. 4348] DEFENDANTS' EXHIBIT No. 150

Stipulation

It is hereby stipulated and agreed by counsel for the respective parties hereto that:

1. Continuously since the completion of Wilson Dam in September 1925, the complainant Alabama Power Company has had a 154 kv. transmission line interconnected with Wilson Dam, and since 1930 the complainant Tennessee Electric Power Company has interconnected at that point with the dam and with the Alabama Power Company by means of a 154 kv. transmission line owned and operated by the Southern Tennessee Electric Power Company.

2. Since 1925 the Mississippi Power Company has been interconnected with the system of the Alabama Power Company and has purchased substantial quantities of power from that company.

DEFENDANTS' EXHIBIT No. 150

3. From 1921 until January 4, 1934, the Alabama Power Company paid the following sums to the Government of the United States for power and use of facilities, namely:

[fol. 4349]

U. S. Nitrate Plant No. 2	Net Energy (k.w.h.)	Total Payments by Years

[fol. 4350] 4. The only interconnections which the two complainant companies, namely, Alabama Power Company and The Tennessee Electric Power Company, had for the delivery of power to them from the Tennessee Valley Authority are the aforesaid interconnections at Wilson Dam.

5. The generating plants at Norris and Wheeler Dams were interconnected with Wilson Dam and placed in opera-

tion as parts of the Tennessee Valley Authority system on July 28, 1936, and November 9, 1936, respectively.

6. These two complainant companies were informed on or about the aforesaid dates that the generating plants at Norris and Wheeler Dams, respectively, were completed; and complainants knew that Norris Dam was in production and interconnected with Wilson Dam in October 1936, and that Wheeler Dam was in production and interconnected with Wilson Dam some time in November 1936. A true copy of letter written by John C. Weadock, General Counsel of The Commonwealth & Southern Corporation, to James Lawrence Fly, General Counsel of Tennessee Valley Authority, under October 24, 1936, is attached hereto as "Exhibit A." A true copy of a letter written by James Lawrence Fly, General Counsel of Tennessee Valley Authority, to John C. Weadock, General Counsel for The Commonwealth & Southern Corporation, under date of October 31, 1936, is attached hereto as "Exhibit B." A true copy of a letter written by Wendell L. Willkie, President of The Commonwealth & Southern Corporation, to David E. Lilienthal, Director of the Tennessee Valley Authority, under date of November 13, 1936, is attached hereto as "Exhibit C." A true copy of a letter written by James Lawrence Fly, General Counsel of the Tennessee Valley Authority, to Wendell L. Willkie, President of The Commonwealth & Southern Corporation, under date of November 17, 1936, is attached hereto as "Exhibit D."

[fol. 4351] 7. The two complainant companies, namely, Alabama Power Company and The Tennessee Electric Power Company, through their aforesaid interconnections through Wilson Dam have purchased power from the Tennessee Valley Authority in the following amounts:

Alabama Power Company	1934	110,127,068 kwh.
	1935	164,127,787 kwh.
	1936	344,308,127 kwh.
Tennessee Electric Power Company	1934	39,514,200 kwh.
	1935	76,022,503 kwh.
	1936	212,313,103 kwh.

8. These two complainant companies, namely, Alabama Power Company and The Tennessee Electric Power Com-

pany, purchased substantial amounts of power from the Authority in each of the last seven months of the year 1936 under the contract of January 4, 1934.

9. Alabama Power Company paid to the Authority a total of $479,573.67 for power purchased from the Authority prior to January 4, 1934, under a contract previously made with the War Department and not under the Tennessee Valley Authority contract. Alabama Power Company and The Tennessee Electric Power Company paid to the Authority an aggregate of $1,814,918.04 for power purchased from the Authority under the contract of January 4, 1934, for the period from January 4, 1934, to February 3, 1937. The above $479,573.67 is included in tabulation on page 2.

10. Complainant Alabama Power Company is currently purchasing power from the Tennessee Valley Authority in accordance with the closing agreement under the contract of January 4, 1934, and taking delivery from the Tennessee Valley Authority by means of its said interconnection through Wilson Dam and over the transmission lines purchased from the Alabama Power Company under the contract of January 4, 1934, to supply urban properties in the ceded area formerly supplied by the transmission lines sold [fol. 4352] to the Tennessee Valley Authority.

Baker, Hostetler, Sidlo & Patterson, Frantz, McConnell & Seymour, Trabue, Hume & Armistead, by S. D. L. Jackson, Jr., Solicitors for Complainants. John Lord O'Brian, Solicitor for Defendants.

October 24, 1936.

John C. Weadock, Justin R. Whiting, Chas. W. Reichhard

James Lawrence Fly, Esq., General Counsel, Tennessee Valley Authority, Knoxville, Tennessee.

DEAR MR. FLY:

In our Cleveland conference you objected to including any reference to TVA letting electric energy generated at

Norris Dam flow upon the power companies transmission lines and the reference made thereto in the proposal submitted to you. I informed you of our opinion that under the contract of January 4, 1934, as amended, the power companies agreed to take power and exchange for power generated at Wilson Dam and not elsewhere and it having been intimated that in any litigation complaining of the acts of the TVA, its directors, officers and agents it may be claimed that the power companies are receiving benefit from the TVA which might estop them from complaining and I told you that because of such intimation the power companies protested against the TVA letting electric energy flow upon the power companies transmission lines and that formal notice thereof would be given.

I started to draft a formal notice and protest along the lines stated to you but it occurred to me that it will be quite enough if I confirm in writing to you that the power companies do protest and object to the TVA letting any electric energy generated at Norris Dam or any place other than Wilson Dam on to their lines and unless you advise me that this letter will not be regarded as sufficient for my purpose no further or formal notice will be given.

Your attention in this regard is particularly called to the provisions of Section 9 of the contract of January 4, 1934, which fixes the points at which the TVA is to supply power to the power companies and clearly refers to points from which power coming from Wilson Dam only could be supplied.

Mr. Wilkie tells me that the power companies will do everything possible to aid in the exploration of the feasibility of a power pool as suggested by the President at the recent White House conference. He has asked me, however, in the meantime to see that nothing is done which may estop the power companies in the present action of the Tennessee Electric Power Co. et al. v. Tennessee Valley Authority, et al. or in any other action from enforcing their rights. It had not occur-ed (sic) to us until the intimation referred to that there was any need for protesting and objecting about Norris Dam power. We would much prefer to obtain an assurance that nothing would be claimed in such litigation.

Very truly yours, (S.) Jno. C. Weadock.

Judge John C. Weadock, Weadock & Whiting, 20 Pine Street, New York City.

DEAR JUDGE WEADOCK:

I have your letter of October 24 stating that the power companies in the C. & S. system protest and object to the TVA letting any electric energy generated at Norris Dam, or any place other than Wilson Dam, onto their lines. I agree with you that your letter is adequate notice of your views and that nothing will be served by giving further or formal notice.

However, as Mr. Lilienthal pointed out to Mr. Wilkie in Washington two weeks ago, and as I pointed out to you at our Cleveland meeting, the power companies have at all times been fully aware of the amount of our generation and water releases at Norris Dam, that all our power is pooled and it is impracticable to segregate Norris from Wilson power, and that the Authority could not have delivered the amounts of power the companies have been taking in the current low water period except for such releases and generation. The amount purchased by you has been a matter in your discretion.

Our contract requires the Authority to supply you with "all of its surplus hydro-electric power," and you therefore have the right to purchase as much power, from all hydro-electric sources, as we have available after satisfying the Authority's other requirements. Our Board feels that it has no alternative but to perform its obligations consistently with the agreements between the parties and the extended practice pursuant thereto.

With kind regards to you, I am

Very truly yours, James Lawrence Fly, General Solicitor.

The Commonwealth & Southern Corporation,
Twenty Pine Street, New York

Wendell L. Willkie, President.

November 13th, 1936.

Mr. David E. Lilienthal, Director, Tennessee Valley Authority, Knoxville, Tennessee.

MY DEAR MR. LILIENTHAL:

Under date of November 9, 1936, Mr. Fly wired me as follows:

"This will confirm our conversation of November sixth regarding the requested interchange at Arlington and the temporary outage on one of the lines of the Alabama Power Company to permit our crossing that line without undue hazard or expense (paragraph) This will confirm on behalf of myself and my associates and on behalf of the Authority the statement which I made to you that neither of these transactions will be mentioned in the course of litigation or will be relied on in any way as against the Commonwealth & Southern Corporation or any of its related companies in any case in which any such company is a party (Stop) Kindly confirm to me by wire Washington office."

To which under date of November 10, 1936 I replied by wire as follows:

"Pursuant to your application (comma) report of Mr. Longley and your engineer and Mister Fly's wire of last night to Mr. Weadock we grant you the exchange point at Arlington as described in your application and the wire crossing in Alabama (Stop) Will you kindly have your engineers get in touch with Mr. J. A. Longley Tennessee Electric Power Company and Mr. J. M. Barry Alabama Power Company to work out details of the respective matters (Stop) Letter follows."

which is hereby confirmed.

I, of course, want again to say that the granting of your request for the exchange point at Arlington and the crossing

in Alabama under the contract of January 4, 1934, is not to be construed as giving consent to your putting power generated elsewhere than at Wilson Dam as constructed and operated at the date of the said contract upon the lines of the "Power Companies," parties thereto, at any point and our protest against your so doing is hereby renewed and emphasized.

I understand you are leaving on a short vacation tomorrow and I hope you will have a good rest.

Sincerely yours, (S.) Wendell L. Willkie, President.

November 17, 1936.

Mr. Wendell L. Willkie, President, The Commonwealth & Southern Corporation, 20 Pine Street, New York.

DEAR MR. WILLKIE:

In Mr. Lilienthal's absence, your letter of November 13 has been drawn to my attention. I discussed the contents of your letter with Mr. Lilienthal by telephone, and he has suggested that I make this response.

We are in agreement as to the terms of the arrangement for the Arlington interchange and the crossing in Alabama, as set forth in your letter. In accordance with the agreement, we do not intend to rely upon either of these transactions as against your companies in the course of litigation as regards the transmission of power from sources other than Wilson Dam.

As to your renewal of the more general protest regarding the propriety of our putting power from the new dams onto the lines of your companies, we believe that our position is satisfactorily spelled out in my letter to Judge Weadock under date of October 31, 1936, which was in response to his letter of October 24.

Sincerely yours, James Lawrence Fly, General Solicitor.

Excerpts from pages 71 to 73 of House Document No. 328

42. Reduction of flood heights by storage reservoirs and surcharge pondage.—In order to determine the reduction of flood heights which may be secured by storage reservoirs and surcharge pondage, the effect which such projects would have upon flood heights on the main stream have been traced downstream from the source of the main stream to its mouth for 10-foot surcharge on Tennessee projects and for certain reservoir projects for the 1926 flood. For this purpose seven cases illustrating the effects which these projects would have had during the 1926 flood were determined as follows:

Case I. Effect of Cove Creek storage.

Case II. Effect of Tennessee River projects operated at normal pool elevation.

Case III. Effect of surcharge pondage secured by 10-foot surcharge on Tennessee River projects in addition to Cove Creek storage.

Case IV. Effect of surcharge pondage secured by 15-foot surcharge on Tennessee River projects in addition to Cove Creek.

DEFENDANTS' EXHIBIT No. 152

Case V. Effect of all storage projects of the entire system and Tennessee River projects operated at normal pool elevation.

Case VI. Effect of all storage projects of the entire system and surcharge pondage secured by 10-foot surcharge on Tennessee River projects.

Case VII. Effect of high dams at Chickamauga, Dam No. 3, and Aurora Landing, assuming reservoirs full at the beginning of flood and normal pool elevation maintained.

The methods employed and the results obtained are shown in detail in Part II, Appendix B, report on partial survey of the Tennessee River and its tributaries, printed in House Document No. 185, Seventieth Congress, first session. Tabulated effect of operations is as follows:

DEFENDANTS' EXHIBIT No. 152

[fol. 4360] 43. Reduction of flood heights by storage reservoirs only.—The results which may be secured by the use of storage reservoirs only are well illustrated by Case I for Cove Creek alone, and Case V for all storage reservoirs of the system. The effect in reducing the height of floods is greatest immediately below the storage reservoirs. This effect decreases in proportion to the distance (uncontrolled drainage area) below the reservoirs. For Case I, Cove Creek alone, the reduction in flood height for the 1926 flood at Rockwood is 6.6 feet, while at Johnsonville it is 1.6 feet. For Case V, all storage projects and projects on the main stream maintained at normal pool elevation, the reduction in flood heights at Chattanooga is 10.4 feet, while at Johnsonville the gage height is increased over that of the natural flood height by 2.1 feet, due to the effect of projects on the Tennessee River when maintained at normal pool elevation. Without surcharge on projects on the main stream all reservoirs of the entire system could not reduce the height of floods on the lower river.

44. Reduction of flood heights by surcharge pondage.—The results which may be secured by the use of surcharge pondage are well illustrated by Cases III, IV, and VI. For Case III, Cove Creek and 10-foot surcharge pondage on the Tennessee River projects, the reduction in flood heights at Chattanooga is 12 feet and at Johnsonville, 8 feet. For Case VI, all storage projects and only 10-foot surcharge pondage on Tennessee River projects, the reduction in flood heights at Chattanooga is 20.8 feet and at Johnsonville 12.8 feet. The effect of surcharge pondage is, therefore, to eliminate an increase in heights of floods by projects along the main stream and in conjunction with the storage held out by storage reservoirs to reduce the height of floods and transmit this reduction to the lower river.

(Original Exhibit)

[fol. 4362] DEFENDANTS' EXHIBIT No. 155

Resolution of Board of Directors of TVA, Adopted December 20, 1937

Whereas, The Assistant Chief Engineer has recommended that the Authority exercise certain options to purchase the site of the proposed Gilbertsville Dam, camp, and access road, and reservoir land adjacent thereto, involving an estimated expenditure of Seven Hundred and Fifty Thousand Dollars ($750,000.00), and

Whereas, Authorization to exercise these options is presently necessary inasmuch as several of them expire on December 31, 1937, and the others shortly thereafter, and

Whereas, After investigating and studying the Gilbertsville Project, the Assistant Chief Engineer and the several consulting engineers have recommended a definite location for the site, which is shown on a map filed with the records of the Authority as Exhibit 12-20-37b, and

Whereas, They have also recommended a maximum pool level of not less than elevation 375, therefore

Be it Resolved, That the recommendations fixing a site and establishing a maximum pool level are hereby approved.

Further Resolved, That the recommendation establishing a taking line as shown on the map (Exhibit 12-20-37b), and based upon a maximum pool level at elevation 375, is hereby adopted as a basis for the acquisition of land.

Further Resolved, That upon receipt of approval from the Head of the Maps and Surveys Division, the Director of the Land Acquisition Department is hereby authorized and directed to exercise the Authority's options to purchase the above described land.

Further Resolved, That upon receipt of approval from the Head of the Maps and Surveys Division, the Director of the Land Acquisition Department is hereby authorized and directed to renew, as the date of expiration is reached, such

options as are now held covering the lands lying within the brown line, so that further consideration may be given to these lands.

Further Resolved, That the options to purchase those lands enclosed within the green lines on the map (Exhibit 12-20-37b) shall be allowed to expire.

[fol. 4363] DEFENDANTS' EXHIBIT No. 156

Resolution of Board of Directors of TVA, Adopted December 20, 1937

Resolved, That the proposed letter by the General Manager to Mr. Clifton A. Woodrum, Chairman of the Subcommittee on Independent Offices Appropriations of the House Committee on Appropriations, with reference to development of plans for the Gilbertsville Dam is approved, and the General Manager is authorized and directed to transmit the said letter in the following form:

The Honorable Clifton A. Woodrum, Chairman, Subcommittee on Independent Officers Appropriations of the House Committee on Appropriations, Washington, D. C.

DEAR MR. WOODRUM:

The Board of Directors of the Tennessee Valley Authority today took action with reference to a more definite determination of plans for the Gilbertsville Dam which, while not materially affecting the budget estimates submitted to your subcommittee, is of such a character that we think the matter should be brought to your attention and the record made clear.

The committee was advised at the hearing on December 13, 1937, that the plans for the Gilbertsville Dam were still in a tentative stage and therefore precise final figures could not be given. However, the printed budget justification which had been submitted to the committee prior to the hearings did set out on page 10 detailed estimates on the Gilbertsville project. These figures were compiled from the best preliminary data available to budget officers of the Authority when the table on page 10 was prepared and

printed in September. At that time, and for months prior thereto, the Authority's engineers, along with a group of consultants, had been making intensive investigations and studies of the projects and were arriving at conclusions differing in some respects from those upon which the budget officers' data were based, particularly in the matter of maximum pool level. While the Authority makes every effort to keep the Appropriations Committee informed of the latest data on its projects, it will be appreciated that plans are constantly evolving and that it is frequently impossible to revise all figures on a project to reflect the detailed changes which our engineers are continuously considering.

Very recently the Authority's engineers and the consulting engineers reached a final conclusion that the maximum pool level for the dam should be set at not less than elevation 375, and they have made recommendations [fol. 4364] accordingly. This figure was five feet higher than the tentative maximum pool level which had been used in prior computations. The reason for the increase was the judgment of the engineers that increased flood storage was highly desirable at the project and economically justified. The change in maximum pool level means that there will be approximately 4,600,000 acre feet of controlled flood storage at Gilbertsville instead of 3,700,000 acre feet, the amount obtained with a maximum pool level at elevation 370, and shown in the table appearing in the budget justification on page 10.

As certain options which the Authority had previously secured for land in this reservoir will expire on December 31, 1937, and as the conclusions of the engineers have matured sufficiently to warrant definite action, the Board today approved their recommendations, authorized the fixing of the taking line as required by a maximum pool level at elevation not less than 375, and provided for the taking up of options accordingly. We attach a copy of the Board resolution.

In order to advise the committee of the latest information available on our projects, we suggest that the tables already submitted to you be revised in line with the latest action, even though there will be no change in the estimated total cost of the project, and no effect on the budget requests.

DEFENDANTS' EXHIBIT No. 156

The change in pool level will somewhat increase the actual cost of the project over a project with maximum pool level at 370. However, as the entire project has been in a tentative planning stage, it was necessary that the estimates of total cost already submitted be only preliminary, and that they should provide a margin for the contingency that in the process of evolution plans might be somewhat changed. Our engineers are satisfied that the overall cost of the project will be well within the figure of approximately $100,000,000 testified to by Mr. Bock at the hearings, and we think the figure of $95,000,000 given on the table, page 10, in our budget estimate can fairly stand as the present estimate for the project.

We should like to state that it is especially important that the record be clarified in view of the fact that the figures which we supplied to the committee in the budget justification have been secured and used by our opponents in the pending litigation in Chattanooga to show a discrepancy between our budget figures and the most recent conclusions of our engineers.

Very truly yours, John B. Blandford, Jr., General Manager.

[fol. 4265] DEFENDANTS' EXHIBIT No. 157

Resolution of Board of Directors of TVA, Adopted February 20, 1936

Resolved, That pending further determinations of policy by the Board, any authority heretofore granted to exercise or execute the option of January 4, 1934, to acquire the electrical properties of the Tennessee Electric Power Company in the Norris Dam area, is hereby revoked.

Further Resolved, That pending further action of the Board, no officer or representative of the Authority is authorized to bind the Authority with reference to the exercise of said option.

Further Resolved, That any offers or tenders heretofore made with respect to said property are hereby withdrawn and revoked.

[fol. 4366] DEFENDANTS' EXHIBIT No. 158

Resolution of Board of Directors of TVA, Adopted January 25, 1935

Whereas, the Authority, by a certain Agreement between it and the Alabama Power Company, dated August 9, 1934, was granted an option by said Alabama Power Company to purchase, for the sum of $1,000,000, certain urban distribution systems in Northern Alabama, more fully described in said Agreement, by which said Agreement the term of said option was to expire on November 12, 1934, and

Whereas, Section 1 of said Agreement, dated August 9, 1934, provided further that the date of delivery of a notice of election by the Authority to exercise the said option granted thereunder should constitute "the purchase date" within the meaning of said contract, which said purchase date was fixed as August 10, 1934, by the delivery by the Authority, on said date, of a notice of election to exercise said option, and

Whereas, Section 3 of said Agreement, dated August 9, 1934, provided that in the event that releases from the liens of the Indentures of Mortgage of said Alabama Power Company, covering said distribution systems, should not be ready and available for delivery within sixty days from the aforesaid purchase date, or from the date of the approval by the Alabama Public Service Commission of said Company's petition for approval of the said sale and conveyance of said distribution systems (whichever was of later date), then the Authority should be under no further obligation to purchase said property, notwithstanding its prior election to purchase the same, and Whereas, more than sixty days have elapsed from said purchase date and from the date of the approval, given on November 24, 1934, by the Alabama Public Service Commission, of the said sale and conveyance to the Authority of said distribution systems by the Alabama Power Company, and

Whereas, heretofore the Authority has made a proper tender to the Alabama Power Company of the consideration called for by said Agreement of August 9, 1934, and has made a proper demand for the conveyance of said properties in accordance with the terms of said Agreement of August 9, 1934, and has at all times been ready, willing, and able to consummate said transaction, and

DEFENDANTS' EXHIBIT No. 158

Whereas, as of the date hereof, the Authority is ready, willing, and able to consummate said transaction by the purchase of said urban distribution systems, and said Alabama Power Company has refused and now refuses to make said conveyance and has failed and refused to obtain said releases, as required by Section 3 of said Agreement, and [fol. 4367] Whereas, said releases required by said Section 3 of said Agreement, dated August 9, 1934, as of the date hereof, are not ready and available for delivery;

Now, Therefore, in consideration of the premises it is:

Resolved, that by reason of the aforesaid failure and refusal of the Alabama Power Company to have ready and available for delivery said releases required by said Agreement, dated August 9, 1934, or to make said conveyance conformably to the provisions of said Agreement, the Authority hereby withdraws from said Agreement of August 9, 1934, and said contract be, and it is hereby, cancelled, annulled and rescinded, and

Resolved, that Charles R. Hoffman, Assistant Secretary of the Corporation, be, and he is hereby, authorized and directed, upon behalf of the Authority, to notify said Alabama Power Company of the determination of the Authority to withdraw from said Agreement of August 9, 1934, and of the cancellation, annulment and rescission, by the Authority, of said Agreement.

[fol. 4368] APPENDIX "A"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 105, being "House Document 328, 71st Congress, 2nd Session," Entitled "Tennessee River and Tributaries, North Carolina, Tennessee, Alabama, and Kentucky"

Page 10

5. At the present time there are 69 terminals on the Tennessee River. The navigation equipment in service on the river consists of 61 towing vessels and 183 barges which are owned by 39 operators. The commerce for 1926 was 1,982,252 tons. The average haul was 15.6 miles, making a total

ton-mileage of 39,020,096. Of this total 48 per cent was forest products, 23 per cent iron and steel, 15 per cent sand and gravel, 7 per cent farm products, and 7 per cent miscellaneous freight. Due to the fact that the river has not been adequately improved for navigation the commerce is small compared with the potential traffic which might use a satisfactory waterway. An appreciable amount of traffic has developed between the mouth and Florence. Above Florence it is impracticable to use boats and tows of large capacity such as are necessary for the economic transportation of heavy freight, and navigation is suspended during the low-water season. The estimated cost of transporting the 1926 traffic by water is $842,777 while the estimated cost of transporting the same by rail is $2,720,481, giving a total annual saving of $1,877,704. Traffic on the tributaries is of insignificant amount except for a considerable movement of sand and gravel on the lower 4 miles of the French Broad River.

Page 11

11. The district engineer considers that it will be possible to provide for 9-foot navigation on the main stream from its mouth to its source, 652 miles, by means of a series of navigation, power and flood control developments that are economically sound. * * *

Pages 12-13

13. Improvement of the main river solely by regulation of flow by means of reservoirs would not be satisfactory, because sufficient navigable depths can not be so secured. It is possible to provide a 9-foot waterway by means of low-lift dams, but such a waterway would be inferior to the high-dam developments and would not permit the economical development of power. * * *

[fol. 4369]

Pages 16-17

23. Flood Control.—The greater part of the flood damages caused to local communities and to railroads and highways occurs on the main stream and on the lower part of the tributaries which are overflowed by backwater from the main stream. It is estimated that the large flood of 1926 caused damages amounting to approximately $2,650,000. In

a supplementary report the district engineer states that in his opinion it is quite possible that floods larger than any previously recorded may some day occur. He estimates that a flood of the magnitude which might be expected on the average once in 500 years would do damage amounting to $14,350,000 and that the average annual damage from floods may be taken as $1,780,000 if due weight is given to the probability of future floods greater than those previously recorded. On the tributaries large floods may occur at any time while on the main stream all major floods of record have occurred during the period of December to April.

Page 17

25. The amount of flood control that can be secured by this project has been determined by a detailed study of the flow that occurred during the December, 1926, flood. The results shown in the following table are obtained by using storage as explained in each case.

Case I. Effect of Cove Creek storage with existing conditions on the main stream and other tributaries.

Case II. Effect of proposed Tennessee River projects operated without surcharge with existing conditions on the tributaries.

Case III. Effect of Tennessee River projects operated with 10-foot surcharge in combination with Cove Creek storage.

* * * * * * *

Condition	Gage height of 1926 flood in feet	
	Knoxville	Chattanooga
Actual	14.8	38.4
Case I	14.8	32.7
Case II	14.8	39.2
Case III	14.8	26.3

Pages 19-20

33. As required by law the report of the district engineer sets up a comprehensive plan for the ultimate utilization of the water resources of the Tennessee River for navigation in connection with power development and the con-

trol of floods. This ultimate plan includes the construction [fol. 4370] of about 200 dams and about 150 power houses, resulting in the canalization of about 1,900 miles of waterway and the production of about 3,000,000 kilowatts of continuous power. The estimated cost of the entire project is in excess of $1,200,000,000. Such a project could be executed only by progressive steps and large portions can not be commenced until many years have elapsed. During this period the development of the art of engineering and changes in economic conditions will indicate the modifications which are necessary in the general layout of those portions of the plan and in the design of the structures. For this reason it would be unwise to adopt or even approve the entire plan at the present time. Considerable portions of the plan lie outside of the present limits of Federal jurisdiction. However, this thorough plan will be a valuable general guide for progressive development of the resources of the Tennessee Basin, and the large amount of engineering data contained in the report and its appendices should be made available for the use of interested parties. The board concurs in the recommendations of the district and division engineers that the report and its appendices be printed.

Page 21

* * * It is evident that the full utilization of the resources of this river for the public benefit requires its improvement by means of high dams built for the joint development of power and navigation.

Page 64

* * * The series of low dams for navigation only provide no flood control.

Pages 496-7

5. The studies indicate that of the total of 27,584,000 tons moving to, from, and across the basin in 1926, approximately 9,559,000 tons could have been more economically transported by water than by rail, resulting in an annual saving of approximately $12,231,000, if the main stream were developed from Paducah to Knoxville. The foregoing figures are based on 1926 traffic. Due to increase in traffic in the United States and in the Southeast, the foregoing

figures would be doubled by the time the waterway is completed (assumed to be 1940). If the main stream were developed only to Chattanooga instead of to Knoxville, only 3,982,000 tons of the 9,558,000 indicated by the studies would be economical and the savings resulting therefrom would be only $5,111,000 of the $12,231,000.

6. While the studies indicate that approximately 9,000,000 tons may be moved economically by water with an annual saving of $12,000,000, it does not seem reasonable to assume [fol. 4371] that all of this freight would take advantage of the waterway. From a knowledge of the manner in which the estimates were made and a study of the various items concerned, it is estimated that 60 per cent of the total is a conservative estimate of that which would use the waterway. According to this estimate, the amount of 1926 rail traffic which would have utilized the waterway had it been constructed is approximately 5,700,000 tons and an annual saving in transportation of approximately $7,300,000. This, added to the tranportation at present utilizing the waterway, amounts to 7,682,000 tons per annum and an annual saving of $9,800,000.

7. The rate of increase in traffic in the United States and the southeastern territory for the 10 years preceding 1926 was approximately 231 per cent of that of 1926. Considering this rate of increase in commerce, it is estimated that by 1950 the commerce which would utilize the waterway if constructed from Paducah to Knoxville is approximately 17,800,000 tons with an annual saving of approximately $22,800,000. For a development of the waterway from Paducah to Chattanooga only the corresponding estimates for commerce which would use the waterway by 1950 are 7,400,000 tons with a saving in transportation of $9,600,000 per annum. The foregoing does not take into consideration the increase in commerce due to industrial development in the basin which is bound to take place when the water power indicated by the survey is developed. It is, however, ample to justify the construction of the combined navigation, water power, flood-control project, or for the project for navigation only in case the water-power project be not promptly developed.

[fol. 4372] APPENDIX "B"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 107, Being Part 1 of the "Annual Report of the Chief of Engineers of the U. S. Army, 1936"

P. 1035

Under the provisions of the Tennessee Valley Authority Act of 1933, as amended by an act approved August 31, 1935, the Tennessee Valley Authority is given power to construct such dams in the Tennessee River as will provide a 9-foot channel and maintain a water supply for same, from Knoxville to its mouth. This agency has under construction at the present time four high navigation power dams as follows: Pickwick Landing (mile 206.7), General Joe Wheeler (mile 274.9), Guntersville (mile 349.0), and Chickamauga (mile 471.0).

[fol. 4373] APPENDIX "C"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 108, Being "Hearing before the Subcommittee of House Committee on Appropriations, 73rd Congress, 1st Session."

P. 23-25

Dr. Morgan: * * * That dam will have one immediate result and another long-time result. Do you want me to go into it fully?

The Chairman: Yes; you may proceed.

Dr. Morgan: At the present time, the Muscle Shoals power is not sold, and we will have to build a market for it. Flood control down the Tennessee River is another item, and, also, navigation. My idea in respect to building this dam is to build it at once, and use it primarily for flood control. Then, when the market for power expands, we would begin to use it for that purpose as well as for flood control. Then, by and by, we would build another dam, say, half for flood control and half for power. Now, the power largely affects flood control all the way down the Tennessee River.

The Chairman: That is by reason of creating reservoirs to hold the water?

Dr. Morgan: Yes. Then as a flood-control measure it will begin to return its value immediately.

The Chairman: How many acre-feet of reservoir does this dam create?

Dr. Morgan: I cannot tell you, because the surveys are not completed. I would rather not put in the record a guess that would be bad. It is a very large reservoir. I can tell you, for instance, that at Chattanooga the dam will lower high water 9-½ feet. That is at a point 150 miles below the dam. Further on down it would lower the water very substantially, all the way down to the Ohio River.

The Chairman: Have you any data available by which you could tell us about how many acre-feet storage there would be?

Dr. Morgan: Yes, sir.

The Chairman: When you get your testimony, you may supply that information for the record.

Dr. Morgan: I will do so.

NOTE.—The estimated storage capacity above the dam is about 3,000,000 acre-feet.

Mr. Bolton: Will your plan conform to the general plans developed by the Chief of Engineers covering flood control, [fol. 4374] navigation, etc., in the Tennessee River?

Dr. Morgan: Yes, sir.

Mr. Bolton: Covering navigation and flood control.

Dr. Morgan: Yes, sir; all together.

Mr. Bolton: Do these plans conform to the studies that were made by the engineers 3 or 4 years ago?

Dr. Morgan: That study was a preliminary study, and the engineers have been modifying it. Therefore there must be some modification of it.

Mr. Bolton: I am referring to the studies and plans that cost the Government about $1,000,000 to make. That was done by the engineers 2 or 3 years ago.

Dr. Morgan: That was a study that covered a very large area, and when we come to actually apply it in detail, we find that it must have some modifications. Some of those plans already have been modified by the Army engineers in construction work already begun under their direction, such large scale plans must necessarily be tentative.

Mr. Bolton: That study covered the Tennessee Valley.

Dr. Morgan: It covered navigation and flood control.

Mr. Bolton: And power, also.

Dr. Morgan: Yes, sir.

Mr. Oliver: You contemplate building a dam at Cove Creek that will serve not only navigation and flood control purposes, but will increase the power at Muscle Shoals and at all intermediate dams between Cove Creek and Muscle Shoals, do you not?

Dr. Morgan: Yes, sir.

Mr. Oliver: And at other dams that may be built hereafter?

Dr. Morgan: Yes, sir. The justification for building it right now is the value we derive from it for flood control. Then, by and by, as the power demand creeps up, we may build another dam. That will afford us a better degree of flood control.

P. 26

Mr. Bolton: I want to make sure that your plans for this development are in general conformity with the plans and studies developed by the engineers for flood control, navigation, and so forth, in the Tennessee River.

Dr. Morgan: They conform to the general policy, but the details are changing.

[fol. 4375] Mr. Bolton: I mean the plans developed by the engineers for the Tennessee River, providing 9-foot navigation, so as to conform to the general governing inland waterway development all over the country.

Dr. Morgan: Yes, sir.

[fol. 4376] APPENDIX "D"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 109, Being "Extract from Hearings before the Subcommittee of House Committee on Appropriations, 73rd Congress, 2nd Session."

P. 162

Dr. Morgan: You are speaking of the Tennessee Valley Authority as being primarily a power development. That is not true. You are assuming that the Tennessee Valley Authority is a power development project.

The Chairman: Not altogether; no. Your dams are primarily necessary for flood prevention. That is another object of it.

Pp. 179-80

Mr. Bacon: Could you give us, for the record, not now, necessarily, what you consider will be the future development of navigation on this river?

Dr. Morgan: I can only give you an estimate; it will only be an estimate.

. . . . . .

Mr. Bacon: You anticipate some real navigation on this river?

Dr. Morgan: Yes.

Mr. Bacon: And can you give some kind of an estimate of what you think it will be?

Dr. Morgan: As well as anybody can.

Mr. Bacon: I wish you would put in the record.

Dr. Morgan: All right.

[The table referred to is as follows:]

The Army engineers propose to provide for 9-foot navigation on the main stream from the Ohio River to Knoxville and to ultimately provide 9- and 6-foot navigation on the principal tributaries. Estimates of possible tonnage with such system of waterways are given in table E, plate 66 of House Document No. 328.

The following table is condensed from plate 66, and gives the estimated possible tonnage for 1950 for the main river and the principal tributaries:

River	Possible tonnage (1950)
Tennessee	13,098,900
Clinch	2,680,000
Powell	2,420,500
Holston	4,018,500
South Fork Holston	28,200
Watauga	28,200
North Fork Holston	235,000
French Broad	470,000

APPENDIX "D"

River	Possible tonnage (1950)
Nolichucky	188,000
Hiwassee	1,175,000
[fol. 4377] Little River	37,600
Little Tennessee	188,000
Sequatchie	235,000
Elk	37,600
Bear Creek—Macky's Creek	3,525,000
Duck	940,000
Total, main river and tributaries	29,304,500

Information on the present status of navigation is given on page 31 of House Document 328. Appendix C, part I, page 205, House Document 328, is a detailed discussion of navigation and contains tables on commercial statistics of water-borne commerce for Tennessee and several tributaries for the years 1920 to 1927. These tables show that the tonnage for the year 1927 on the various rivers was as follows:

River	Tonnage
Tennessee	2,291,519
Clinch	7,380
French Broad	121,373
Hiwassee	860
Holston	945
Little Tennessee	375
Duck	2,150
Buffalo	51,718

The figures given for the tributaries in table E are very optimistic.

* * * * * * *

Mr. Bacon: Also, on flood control, could you put in the record the information on floods on the Tennessee River in the past?

Dr. Morgan: Yes.

Mr. Bacon: Those facts must be available. * * * Those will be generally greater than the estimate made by the Army.

APPENDIX "D"

P. 181

The estimated damages for the Army's 500-year flood are also given, but in this figure the Authority does not concur for the reasons previously stated in this memorandum.

P. 184

Mr. Taber: How much do you estimate will be the cost of the Norris Dam?

Dr. Morgan: Thirty-four millions.

Mr. Taber: And in that there is nothing in the nature of navigation?

Dr. Morgan: Except that that will raise the water level on the lower river as much as possibly a 20 million dollar expenditure on the lower river itself.

Mr. Bolton: Do you know how much tonnage is expected on the river?

. . . . . .

[fol. 4378]

P. 184

Mr. Taber: The Hiwassee Dam is next; how much do you estimate on that?

Dr. Morgan: Our estimate is 13 millions. There is a question as to the site. We have not established which site we will use.

Mr. Taber: There is nothing in the nature of navigation there.

Dr. Morgan: Except there is hardly anything you can do for navigation better than to even up the flow above; by letting out stored water and at low water.

P. 185

Mr. Taber: How high is Pickwick Landing Dam?

Dr. Morgan: It is about 50 feet.

P. 186

Mr. Taber: Is this a storage proposition?

Dr. Morgan: That is a run of the river plant; in that, more than in any other, navigation is the important item. The rapids below Muscle Shoals will be flooded by that dam and made navigable.

[fol. 4379] APPENDIX "E".

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 112, Being "Extract from Hearings before the Subcommittee on Appropriations, United States Senate, 73rd Congress, 2nd Session".

P. 272

Dr. Morgan: The people of the community establish the cooperatives and we contract with that cooperative. The cooperative is a local organization, organized in that community, and we are making a contract with that cooperative that under these conditions we will furnish power, just as we are making contracts with municipalities that we will furnish the power.

[fol. 4380] APPENDIX "F"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 114, being "Hearing before the Subcommittee of the House Committee on Appropriations, 74th Congress, 1st Session".

Pp. 468-9

Dr. Arthur E. Morgan: The selling of those bonds would imply that this entire program is a self-liquidating program. Part of it is; part of it is not. Part of it is a flood-control program. For instance, in the building of the Norris Dam, if we were building it for navigation and power alone, it would be built to a certain height. By adding about one-third to the cost of that, we added great elements of flood control, and such flood control is definitely an additional cost. It meant a that much bigger dam, that much more flowage to purchase, and so forth.

This is only incidentally a power development. It is primarily a navigation development and a flood-control development. Neither navigation nor flood control is self-liquidating in the usual sense.

Damages as Result of Tennessee River Floods

Mr. Thurston: What is there along that river to flood, Dr. Morgan?

Dr. Arthur E. Morgan: Our work has a very definite effect on the Mississippi River and the Ohio below. The damages will run about $2,000,000 a year on the Tennessee itself, from floods.

Mr. Thurston: Damages to what?

Dr. Arthur E. Morgan: To property. The biggest damage is in the city of Chattanooga, where the damages will run something between a half million dollars and a million dollars each year on the average.

Mr. Thurston: Each year they come down and erect buildings in this area that they know the high water will damage the following year?

Dr. Arthur E. Morgan: No; a substantial part of the city is subject to floods.

Mr. Thurston: But you say that the damage is about a million dollars each year.

Dr. Arthur E. Morgan: That does not mean that they have put up new buildings. Take the railway terminals, for instance. They cannot put those where they please. They have to put them where the lay of the land requires, with factory buildings, and so forth. About the only places to build for many of those facilities are places that are subject to flood. That is the case in many other cities. In Cincinnati, for instance, if they should eliminate all building below the flood level they would have a serious situation.

Mr. Thurston: But they do constantly come down and put buildings on this area that are washed away by floods?

Dr. Arthur E. Morgan: No; not washed away. It is very much damaged. I should say that is even more true of railroad facilities, they do not rebuild the tracks every year, but there is damage done, and they come back and rehabilitate the damage.

[fol. 4381] Mr. Thurston: So they have damage of about a million dollars each year in the city of Chattanooga?

Dr. Arthur E. Morgan: There is a listing of those damages in the Army Engineers' Report 309, published, I think, in 1929.

Mr. Thurston: One would think that some of these people that have these losses each year would move up to higher ground so they would not be subject to that damage each year.

Dr. Arthur E. Morgan: It is not always feasible. There are a good many cities in which that is true. Take the railroads, for instance. Railroad lines follow the topography of the country. A railroad cannot climb up over hills or very steep grades. You find a good many towns in America where the change is not feasible, that is, to get out of the reach of floods entirely.

Mr. Bacon: So that to prevent floods in Chattanooga you would need dams above Chattanooga. That is where the Norris Dam comes in; is that correct?

Dr. Arthur E. Morgan: That is correct.

(Here follow three photolithographs, side folios 4382-4384)

General summary analysis of estimates

Programs and projects	Actual fiscal year 1934	Allotment, fiscal year 1935	Estimate, fiscal year 1936	Remarks
I. Navigation an flood control program:				
A. Norris Dam and Reservoir	96, 713, 785	$18, 847, 040	$10, 661, 426	Total estimated cost $36,222,246
B. Wheeler Dam and Reservoir	2, 181, 221	15, 972, 449	8, 690, 022	Total estimated cost $26,843,782.
C. Pickwick Landing Dam and Reservoir	.....	2, 880, 343	10, 618, 000	Total estimated cost $24,364,499.
D Tributary dam projects	.....	280, 666	6, 400, 000	
E. Main river dam projects	.....	69, 940	3, 370, 000	
F. General investigations of water resources	95, 320	299, 655	280, 000	
Total, water control program	8, 990, 309	38, 330, 223	40, 046, 530	
II. Electricity program:				
A. Electricity operations (wholesale)	¹ 548, 657	¹ 136, 023	¹ 713, 000	
B. Temporary retail operations	¹ 2, 770	¹ 27, 849	¹ 20, 000	
C. Electric plant and equipment	1, 874, 319	6, 568, 724	5, 505, 000	
Total, electricity program	1, 322, 892	6, 404, 582	4, 772, 000	
III. National defense program:				
A. Muscle Shoals general properties	513, 588	920, 325	280, 000	
B. Fertilizer projects	560, 512	2, 064, 455	2, 225, 000	
Total, national defense program	1, 074, 100	2, 983, 780	2, 578, 000	
IV. Related regional development program:				
A. Agriculture, watershed protection	24, 346	402, 701	2, 892, 000	
B. Industrial research and surveys	40, 201	558, 245	875, 000	
C. Forestry, watershed protection	105, 644	307, 058	526, 000	
D. Land planning	28, 922	231, 943	230, 000	
E. Social and economic	157, 116	431, 526	800, 000	
F. General mapping	¹ 70, 067	969, 520	410, 000	
Total, regional development program	555, 286	2, 900, 992	5, 432, 000	
V. Other undistributed expenditures:				
A. General equipment	414, 425	291, 682	100, 000	
B. Administration and service expense (undistributed)	128, 336	¹ 1, 325	.....	
Total, other undistributed expenditures	543, 761	290, 357	100, 000	
Grand total, all programs	12, 486, 348	51, 909, 314	52, 929, 530	

¹ Revenue, credit.

Revision of general summary analysis

[This tabulation is a revision of the general summary analysis of Budget estimates of the Tennessee Valley Authority for 1936, presented to the House Appropriations Committee at hearings on May 28, 1935. The changes, with the exception of the rearrangements, which are explained in the footnote (1), are made pursuant to a request from the committee. Some items are decreased and others increased from the amounts recommended by the Authority at the hearings]

Programs and projects	Actual, fiscal year 1934	Allotment, fiscal year 1935	Estimate, fiscal year 1936	Remarks
I. Navigation and flood-control program:				
A. Norris Dam and Reservoir	$6,713,708	$18,847,049	$10,661,428	Total estimated cost $26,222,246.
B. Wheeler Dam and Reservoir	2,181,221	15,972,449	8,690,092	Total estimated cost $26,843,762.
C. Pickwick Landing Dam and Reservoir		2,889,882	10,615,089	Total estimated cost $26,264,499.
D. Tributary dam projects (Hiwassee Dam)		260,668	6,280,000	Reduced $280,000 from T. V. A. proposed budget. Total estimated cost $12,000,000.
E. Main river dam projects (Guntersville and Chickamauga Dams)		62,840	5,000,000	Increased $1,700,000 from T. V. A. proposed budget, in order to provide funds for beginning second downriver dam (Chickamauga) if construction is found technically feasible.
F. General investigations of water resources	96,230	299,655	280,000	
Total, navigation and flood-control program	8,990,209	38,332,223	41,496,529	
II. Electricity program:				
A. Electricity operations (wholesale)	[1] 548,057	[1] 136,028	[1] 713,000	
B. Temporary retail operations	[1] 2,770	[1] 27,849	[1] 20,000	
C. Electric plant and equipment	1,874,319	6,568,734	5,044,000	
Total, electricity program	1,322,093	6,494,843	4,313,000	
III. National defense and fertilizer program:				
A. Muscle Shoals general properties	513,988	929,225	280,000	
B. Fertilizer projects—nitrate plant no. 2	500,512	2,064,455	3,593,000	See footnote 1
C. Fertilizer demonstrations—Valley States		206,407	702,000	Do.
Total national defense program	1,074,100	4,200,187	4,525,000	

See footnotes at end of table.

*Undistributed Expenditures - $100,000 - .19%.

Appendix "F"

[fol. 4385] Pp. 480-1

The Chairman: Now, reverting back to your summary statement, we have the item of general investigations of water resources. You spent $95,320 in 1934; you spent $299,655 in 1935; and you expect to spend $280,000 in 1936?

Dr. Arthur E. Morgan: Yes, sir.

Borings for the Aurora Dam

The Chairman: Just what is that project?

Dr. Arthur E. Morgan: That is working out the engineering problems in connection with dam construction. One of the large items there, which we have not isolated because it is so difficult to tell in advance, is the borings for the Aurora Dam or for some other dam near the mouth of the Tennessee River. We are exploring the possibilities.

The Chairman: The possibilities of what?

Dr. Arthur E. Morgan: Of foundation.

The Chairman: Then this exploration is for the purpose of finding a dam site, with suitable foundation, suitable banks, and so forth, to construct a dam at or near Aurora Landing; is that it?

Dr. Arthur E. Morgan: That is part of it. Another part is the silt investigations. We are carrying on investigations of the rate at which these reservoirs will silt up, and how to handle that. Then there is stream flow.

Stream Flow Investigations

The Chairman: You ought to have had that for years now.

Dr. Arthur E. Morgan: The trouble is that the records are inadequate. We could work with very much greater surety if they had actually been better developed.

[fol. 4386] The Chairman: The Geological Survey has been taking stream flow, has it not?

Dr. Arthur E. Morgan: But very inadequately. The records there are very inadequate for planning purposes. We have put in 114 gaging stations on the various tributaries, so that we can get those records.

The Chairman: It will take several years to get accurate records, will it not?

Dr. Arthur E. Morgan: Every year adds to what we have, especially as to low flows.

The Chairman: Stream flow depends on the rainfall, and the rainfall may be several inches deeper in one year than in another.

Dr. Arthur E. Morgan: Yes; and our rainfall records are inadequate. In the operation of these dams we must know how much to hold back in our various reservoir dams, and when to let it out, and when we need to hold it. The effective operation of those dams depends upon a knowledge of rainfall and run-off which will take years to develop fully.

The Chairman: Well, are we going to maintain a complete set of rainfall gages and river gages for the operation of this Tennessee River system, and not depend on the Weather Bureau at all?

Dr. Arthur E. Morgan: We are not doing that. We are cooperating with both the Weather Bureau and the Geological Survey. They are keeping up their own records, and where we need additional ones to get effective knowledge, we are adding them; but the records are turned over to them and are published by them. We are not setting up any additional facilities except where it is necessary to fill in the records, and there we are turning them over to the Geological Survey and the Weather Bureau for their use. We are working in very close cooperation with them.

Pp. 482-3

The Chairman: This is what is in my mind. You have started three dams, have you not?

Dr. Arthur E. Morgan: Yes.

The Chairman: That is all, is it?

Dr. Arthur E. Morgan: Yes.

The Chairman: The Norris Dam, the Wheeler Dam, and the Pickwick Landing Dam; that is all you have stated?

Dr. Arthur E. Morgan: Yes.

The Chairman: Have you any reason to believe that regulation by those three dams will not prevent overflows?

Dr. Arthur E. Morgan: Yes.

The Chairman: You do not think they will?

Dr. Arthur E. Morgan: They will not completely, no. They will go a long way toward preventing overflow.

The Chairman: You think they will prevent all except very high overflows?

Dr. Arthur E. Morgan: No; they will do about between a half and a third of the job on the Tennessee River. They will add substantially to the value of flood control on the Ohio and the Mississippi River also. But they will not completely prevent floods on the Tennessee. That is only one of their purposes.

[fol. 4387] P. 485

Mr. Bacon: How many dams in all will be necessary to complete the 9-foot channel, in which I presume will go to Knoxville?

Dr. Arthur E. Morgan: To Knoxville.

Mr. Bacon: How many additional dams will be necessary for a 9-foot channel?

Dr. Arthur E. Morgan: Three to a point just above Chattanooga.

Mr. Bacon: Three in addition to the four now built or building?

Dr. Arthur E. Morgan. Yes.

P. 495

Dr. Arthur E. Morgan: Yes; it is this: That the Congress established the policy of creating a 9-foot channel in the Tennessee River to Knoxville by means of low navigation dams. It was acknowledged on all sides that high dams were better than low dams and the specific statement is made that if a private organization, or a State or a municipality—if any other agency shall build high dams—then the cost of building low dams shall be contributed to them by the United States.

Mr. Bacon: As a practical matter, no municipality or private concern is going to build on the Tennessee River, because you would not let them.

Dr. Arthur E. Morgan: This law was passed before the Tennessee Valley Authority Act.

The Chairman: All of that is conditioned upon the high dam being constructed so that it would aid navigation?

Dr. Arthur E. Morgan: Yes. As the Army Engineers testified in this other hearing, and as is generally recognized, high dams are very much more economical. But for navigation— for instance, as an illustration, the Wilson Dam takes the place of about seven low dams. The two combined locks, the tandem lock at Wilson Dam, is very much cheaper to operate than it would be to operate seven low dams with a few miles between each one.

The low dams leave a navigation channel which is very narrow, where it is canalized. The high dam leaves a full width of the river in which to travel.

There is no comparison whatever as to the relative values of the two dams.

The Chairman: The high dam backs up water which it can release for purposes of navigation into the lower parts of the river below.

Dr. Arthur E. Morgan: Yes.

The Chairman: That is very plain.

Pp. 518-19

The Chairman: You have an item of $40,000 for "transportation investigations (economics)". You state that these are studies of transportation problems. Does not that look far-fetched in connection with this valley?

Dr. Arthur E. Morgan: No, sir; not in that valley. That region is in a fairly impossible condition from the transportation standpoint.

We are developing a navigation system on the Tennesseee River, and one of our primary considerations is where are the terminals going to be.

The Chairman: Where the towns are located, at suitable points.

[fol. 4388] Dr. Arthur E. Morgan: That may not follow. The set-up of transportation for that region for the future, as far as we can see, will be this: There will be river terminals where they will gather up all these materials from the region around for 50 or 75 miles, and they will be brought in by truck or boat. The highway system has not been developed.

Mr. Thurston: Do they not have State highways systems?

Dr. Arthur E. Morgan: We are working with them. We are cooperating with them.

Mr. Thurston: Is it not primarily the duty of the State of Tennessee to provide roads within the State?

Dr. Arthur E. Morgan: We are not providing roads. Through Alabama and Tennessee, we are working in cooperation with the States themselves. We are trying to coordinate the railroad facilities with the highway facilities and navigation facilities, so as to work out an economic program. That is all we are trying to do.

Pp. 523-4

The Chairman: You refer to four dams—the Wilson Dam, the Norris Dam, the Wheeler Dam, and the Pickwick Dam. Do you believe that these dams will produce all the power you will need to meet the demand for power?

Dr. Arthur E. Morgan: Our studies indicate that by the time the dams are built there will be a shortage of power of more than what they can produce. The studies of the Federal Power Commission and our own studies are together on that.

The Chairman: Then you think the Hiwassee project is of next importance. You think it is important to complete the project from every standpoint; flood control, production of power, and navigation?

Dr. Arthur E. Morgan: As I say, this estimate does not include power installation. We would not install the power facilities until we find that we need it.

The Chairman: I understand that. But you think it is necessary for the other two elements?

Dr. Arthur E. Morgan: Yes.

P. 535

Mr. Lilienthal: * * * About 98 per cent of the rural area in that section, which is a prosperous section in the valley, does not have any electric service at the moment; and in addition to that a group of some seven or eight municipalities in west Tennessee, in this same group of counties, has petitioned for a source of power. They are now supplying their own needs through expensive steam stations, many of them obsolete, and fuel stations.

The Chairman: How much is that line estimated to cost?

Mr. Lilienthal: That totals $1,650,000. That will provide an outlet and an additional source of revenue for power.

The survey of that project is still incomplete, but it appears to be a very likely and appropriate thing to do from a business point of view, without in any way taking away existing business of any private company.

The Chairman: That is $2,700,000 and $3,495,000.

[fol. 4389] P. 538

Mr. Lilienthal: This is new construction, in 8 counties in Mississippi, 6 counties in Alabama, and 5 counties in Tennessee.

The Chairman: You mean the new construction of lines?

Mr. Lilienthal: The construction of farm lines to farms not now served; yes, sir.

P. 540

Mr. Thurston: Section 23 (3), it seems to me, is very interesting.

The maximum generation of electric power consistent with flood control and navigation.

Where do you get additional authority to make power that you expect to sell generally? Under what section is that?

Dr. Arthur E. Morgan: The maximum control of electric power consistent with flood control and navigation is this: Whenever you build a dam, you inevitably develop hydraulic power. You lift that water up so that it has got to fall. Now, if we could get into a position where the further navigation and flood control could be carried by this method, and if the Government has no burden of carrying navigation and flood control currently, year to year, all that is good.

Now, when we are building a dam, we essentially create hydraulic power. The question then is, shall we waste that or shall we develop whatever is consistent with navigation and flood control?

Mr. Thurston: It seems to me, though, that you are going to generate so much more power than you can use in your own enterprises that, of course, you will have an excess to sell or go to waste.

Dr. Arthur E. Morgan: We are only changing its nature from hydraulic power to electric power. That power is

developed when we build the dam. Now, whether we use that power or waste it is another matter. It is just a question of whether we use it or waste it. If we build these dams, that power is going to be there. Are we going to use it or waste it? That is the only question.

The Chairman: In other words, the development of hydroelectric power, under this act, extends only to flood prevention and navigation?

Dr. Arthur E. Morgan: Yes, sir; and you cannot build these dams without developing hydraulic power. The dam makes that head of water. Now the question is, are we going to waste it or are we going to use it?

Pp. 616-17

Dr. Arthur E. Morgan: I should say, as to the Norris Dam, that the power is only one item there. It happens that power and navigation pretty well coincide. When the rivers are low, you need it for navigation, and you are liable to need it for power at the same time; but the navigation has the right-of-way.

[fol. 4390] Navigation

Mr. Taber: I do not suppose there is any substantial navigation there at the present time.

Dr. Arthur E. Morgan: We are having quite a bit of navigation. The materials for building our dams are hauled on the river. There is pretty heavy navigation now.

Mr. Taber: But that is about all there is of it?

Dr. Arthur E. Morgan: That is the greater part.

Mr. Taber: Is it open for navigation?

Dr. Arthur E. Morgan: No, sir; only in sections. We cannot have navigation until we get a channel to navigate in. Our channel is down to a foot and a half deep in some stretches, and until that channel is completed we have no conditions for through navigation.

Mr. Taber: Then how are you able to use it for your own purposes?

Dr. Arthur E. Morgan: We cannot go beyond our own.

Mr. Taber: You mean you cannot go beyond your own Wheeler Dam?

Dr. Arthur E. Morgan: Yes, sir. That is at the head of the pool of Wilson Dam, you see. We have got fine gravel

deposits just above us that we would like to use in the Wheeler Dam, but the channel is so shallow that we cannot use it; and we are getting the gravel 50 miles away, down the river, because we cannot get up the river to get it.

Mr. Taber: And does the Wheeler Dam throw the water back to maintain navigation all the way to Norris or not?

Dr. Arthur E. Morgan: Oh, no. It throws it back about 80 miles up to Guntersville. With the Hales Bar Dam, which now exists, and the Guntersville Dam, in between, the water will be backed up to Chattanooga.

Mr. Bacon: And the Chickamauga Dam will carry it to Knoxville?

Dr. Arthur E. Morgan: No; there is no dam in between. The White Creek Dam and the Chickamauga and perhaps a dam at Coulters Shoals will take it to Knoxville.

Mr. Bacon: And the Aurora will bring it up to Pickwick?

Dr. Arthur E. Morgan: Yes, sir. The Norris Dam will raise the level down to Pickwick; so we will have about 7 feet already. The Aurora would make it 9 feet or more.

Mr. Bacon: The Aurora will not have to be a very high dam, then?

Dr. Arthur E. Morgan: It will be about 40 feet, I think: but it will be an expensive one, because the foundations are not the best.

Pp. 626-7.

Mr. Taber: In order to understand the actual situation with reference to flood damages incurred on the Tennessee River, it appears that this entire basin, according to the statement you gave us the other day, reflects an average annual flood damage, on account of all floods, running to $291,000 a year. Is that approximately correct?

Dr. Arthur E. Morgan: The total estimated average annual damage from all floods is $1,784,000.

[fol. 4391] Mr. Taber: Where do you find that?

Dr. Arthur E. Morgan: That is in the last column. What you were reading from is just the land. The first column is for cities, which is $1,000,000 a year—cities and towns: the second is land, $291,000; the next is railroads, $332,000; the next is highways, $157,000; and the total is $1,784,000, as an average annual costs.

Mr. Taber: With reference to Pickwick Dam, there is not to be any power installation; that is practically a navigation proposition for the present; is that correct?

Dr. Arthur E. Morgan: There is about a million acre-feet of flood control there. It is more substantial than any other dam for flood control, except Norris.

Mr. Taber: There is a very substantial flood-control value there.

Dr. Arthur E. Morgan: Yes.

Mr. Taber: Because you impound how much water?

Dr. Arthur E. Morgan: One million three hundred thousand acre-feet volume. We have under consideration raising that a few feet to add to its flood storage.

P. 631

Total Reservoir Storage of Water at Four Dams

The Chairman: I do not know whether you got this complete in the record or not, but I want to have you put it all in one place. I will read this statement to see if it is correct. As to the acre-feet of water that could be impounded under these dams when completed, the amount for the Wilson Dam is 500,000 feet; for the Wheeler Dam 1,250,000 feet; for the Norris Dam 3,650,000 feet; and for the Pickwick Dam 1,032,000.

Navigation to Knoxville, Tenn.

I want to make this clear. Up to what point does this project contemplate navigation?

Dr. Arthur E. Morgan: Up to Knoxville.

The Chairman: What dams are absolutely essential to be constructed to provide navigation to Knoxville?

Dr. Arthur E. Morgan: In addition to those we are now building?

The Chairman: What dams are essential?

Dr. Arthur E. Morgan: The Aurora Dam.

The Chairman: Is the Norris Dam in it?

Dr. Arthur E. Morgan: It furnishes water.

The Chairman: Is it essential? It is a mother dam, is it not?

Dr. Arthur E. Morgan: Yes, Norris Dam, Wilson Dam, Wheeler Dam, Pickwick Dam, Aurora Dam, Guntersville,

Chickamauga Dam, and White Creek Dam are essential and the Hiwassee Dam will be valuable, but not indispensable.

The Chairman: That will give a 9-foot channel, will it?

Dr. Arthur E. Morgan: Yes.

[fol. 4392] Pp. 635-6

Mr. Bacon: Which do you think would be the most valuable, so far as you can picture it.

Dr. Arthur E. Morgan: Guntersville would be the most valuable, because that would bring navigation up to Chattanooga. It would make Chattanooga the head of navigation.

Mr. Bacon: And that navigation would be available in carrying out the work up to Chattanooga.

Dr. Arthur E. Morgan: Yes.

Mr. Bacon: Then you will have pretty good navigation from Chattanooga down to Pickwick, and how far below?

Dr. Arthur E. Morgan: We will have a 7-foot channel down to the Ohio River.

Mr. Bacon: Down to Paducah.

Dr. Arthur E. Morgan: Yes, sir.

Mr. Bacon: You would have a 7-foot channel down to Paducah, including a 9-foot channel from Pickwick to Chattanooga, if you build the Guntersville Dam.

Dr. Arthur E. Morgan: Yes, sir. A 9-foot channel from Chattanooga to Pickwick to 7 feet below. It may be 6½ feet.

Mr. Bacon: When the Chickamauga Dam, White Creek Dam, and Coulter Shoals Dam are built at a cost of $45,000,000 you will have a 9-foot channel from Chattanooga to Knoxville, but you do not intend to go ahead with that until you have built this 9-foot channel from Chattanooga to Guntersville.

Dr. Arthur E. Morgan: You have stated the case, from the standpoint of navigation. The Guntersville Dam would bring navigation right to Chattanooga.

Mr. Bacon: You would not want to go above Chattanooga with a 9-foot channel until you brought it to Chattanooga.

Dr. Arthur E. Morgan: No; probably not for navigation purposes.

Mr. Bacon: Will there be power at Chickamauga?

Appendix "F"

Dr. Arthur E. Morgan: Yes; good power.
Mr. Bacon: Will you put the power installation in
Dr. Arthur E. Morgan: When it is needed.
Mr. Bacon: How about Guntersville.
Dr. Arthur E. Morgan: It is the same thing there.
Mr. Bacon: You will not install it right away, but you will fix it so it can be installed?
Dr. Arthur E. Morgan: Yes.

[fol. 4393]

Appendix "G"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 115, Being "Hearing before the Subcommittee of House Committee on Appropriations, 74th Congress, 2nd Session, Part I."

P. 115

We have an item of about a half million dollars to continue exploration at Gilbertsville.
The Chairman: Did you find a foundation there?
Dr. A. E. Morgan: Yes, we found a good foundation finally.
Mr. Taber: Did you get away from the cave situation at Aurora?
Dr. A. E. Morgan: Yes.
Mr. Taber: You found it was not a good site.
Dr. A. E. Morgan: It was not a good site, and we have gone down the river where we can provide much better flood control.
Mr. Taber: Have you made drillings, or are you not far enough along to tell us about that?

P. 124

The Chairman: As for navigation, figuring on the dams that you recommend, how many miles of river will be navigable?
Dr. A. E. Morgan: There will be just about 750 miles of 9-foot navigation—650 miles on the main river and something over 100 miles on the tributaries.

APPENDIX "G"

P. 125

Dr. A. E. Morgan: Yes, sir; the output would be from that capacity; but I would like to go further than that and say that that means only a part of the total generating capacity that would be possible if the market grows. I would like further to say that in making a navigable channel, you must build the dams where dams are required for navigation. You cannot build them where they happen to be suited for power development. For instance, the location of the Chickamauga Dam site, that was appropriated for last year, is determined by the requirements for navigation. Nobody would ever build a dam there for power, but a dam is required at approximately that location to provide a navigable channel.

The Chairman: What dam is that?

Dr. A. E. Morgan: The Chickamauga Dam. You asked when there would be a return from power, and I was saying, that some of these dams would not be built if power were the main objective, but they are built in order to provide a navigable channel.

The Chairman: And to prevent floods.

Dr. A. E. Morgan: Yes, sir.

[fol. 4394] Pp. 126-7

Dr. A. E. Morgan: The only way to get at this is this: The levees in the Mississippi Valley have been built up about as high as they can safely be built. It is estimated that if it were at all feasible to raise them higher, it would cost somewhere between $35,000,000 and $50,000,000 a foot to raise the levee system higher. When you undertake to do that, you get into great difficulties because of raising the flood levels in the backwater of the tributaries.

The Chairman: The levees back the river up.

Dr. A. E. Morgan: Yes, sir. If the flood level is raised on the main river, the water level will be backed up the tributaries a greater distance. This system of reservoirs proposed by the TVA would lower the flood water stage along the Mississippi levees possibly 3 feet.

The Chairman: On the stretches below.

Dr. A. E. Morgan: Yes, sir, below the mouth of the Ohio.

The Chairman: I am asking you——

Dr. A. E. Morgan (interposing): I am indicating the difficulty of calculating just what the flood benefit would be on the Mississippi, but a reasonable estimate would be somewhere about $100,000,000.

The Chairman: What benefit does the country realize from navigation, and what from flood prevention, from the erection of these dams?

Dr. A. E. Morgan: I would say that possibly for flood control on the Mississippi, $100,000,000 might well be charged. Possibly a third or a half of the cost of the system might properly be charged to flood control.

Mr. Bacon: And the other half to navigation?

Dr. A. E. Morgan: Yes, sir.

The Chairman: How much should be charged against navigation?

Dr. A. E. Morgan: Possibly half. For flood control we have a more definite calculation. I must add that these are very rough estimates or guesses. In discussing these matters you appreciate that I am largely speculating in general-ties. We are now preparing the report on the allocations of value of all the properties to submit to Congress in detailed form as required by the act.

Mr. Bacon: Taking the investment of $343,000,000, would you say that half would be chargeable to flood control and the other half to navigation?

Dr. A. E. Morgan: I think the other half could be charged properly to navigation.

The Chairman: In other words, you think that the benefit that the country receives from flood control and navigation justifies the entire expenditure?

Dr. A. E. Morgan: Yes, sir.

Pp. 127-9

Mr. Bacon: You say that half of the $343,000,000 may be charged to navigation. What navigation will you get when the project is finished, or what depth will you give?

Dr. A. E. Morgan: A minimum of 9 feet draft. That would be a minimum 12-foot channel, because you want that much depth under the vessel. On the lower part of the river, the locks are 110 feet wide and 600 feet long, with a usuable depth of 10 feet. This system will connect with the general

Mississippi system, with a total of something over 5,000 miles of similar channel.

Mr. Bacon: Do you think there is enough navigation on the river to warrant an expenditure of $172,000,000?

[fol. 4395] Dr. A. E. Morgan: I believe there will be as time goes by. It will not happen all at once; it will take some time for navigation to develop. The War Department in 1926 estimated that by 1950 the actual savings on the freight hauled would be $22,000,000 a year.

Mr. Bacon: By 1950.

Dr. A. E. Morgan: Yes, sir.

Mr. Thurston: Three per cent of $171,000,000 would be approximately $5,000,000. You would have to show a net profit on transportation of $5,000,000 a year.

Dr. A. E. Morgan: The War Department estimated the saving by 1950 on the cost of freight would be $22,000,000 a year.

Mr. Thurston: The charge-off for flood control, would be $171,000,000, for the limited area that would be protected by flood control.

Dr. A. E. Morgan: Its chief value would be on the Mississippi. The Mississippi levees are now getting to the point where they cannot safely be built higher without substantially increasing the cross section. If they are built any higher, there will be increased danger of failure from excessive seepage through sand layers underneath.

Rivers Contributing Flood Waters to Mississippi River

Mr. Thurston: Has there been any estimate of the flood waters supplied by the various tributaries of the Mississippi?

Dr. A. E. Morgan: The contribution of flood waters is largely by the Ohio and the tributaries entering farther down the river. The whole Missouri River watershed, would not make as much difference as the Tennessee River. It is the lower tributaries that cause the greatest floods.

Mr. Bacon: What are those tributaries?

Dr. A. E. Morgan: There are four of them, the Arkansas, the Ohio, the Tennessee and the Red.

Mr. Thurston: Have they finished the project under the Public Works appropriation, on the lower Mississippi, or

has that been discontinued because of the Tennessee Valley project?

Dr. A. E. Morgan: I do not know how to answer that question.

Mr. Thurston (interposing): That project is an independent scheme of the Army engineers, for the control of Mississippi flood waters.

Dr. A. E. Morgan: I do not know. I cannot answer that.

Mr. Bacon: If you improved the Ohio, or if you could control floods in the Ohio, that would be important in the control of floods in the Mississippi. The Ohio is more important in that respect than the Tennessee, is it not? You do not have as much flood in the Tennessee as in the Ohio, do you?

Dr. A. E. Morgan: Yes, sir; we have very destructive floods in the Tennessee.

Cooperation With Corps of Army Engineers

Mr. Thurston: I want to know if the Tennessee Valley Authority coordinates its work with that of the Corps of Army Engineers for flood prevention in the Mississippi River.

Dr. A. E. Morgan: Yes, sir; we are endeavoring to do so.

Mr. Thurston: Do you have a joint board to coordinate it?

Dr. A. E. Morgan: We do not have a formal joint board, but their representatives and our representatives meet together. Arrangements have been made for their liaison [fol. 4396] officer to meet out liaison officer. Two or three weeks ago we spent considerable time in their office at Louisville, we going over their data and they going over our data. We used their data and they use ours.

Mr. Thurston: The basic principles upon which your river work has been progressed were not drawn up or made up by War Department or the Army Corps of Engineers, were they?

Dr. A. E. Morgan: The War Department, or the Corps of Engineers, United States Army, recommended to Congress that the Tennessee River be improved for 9-foot navigation from Knoxville to the mouth. They indicated two ways of doing that—one by a series of low navigation dams, which

were to be provided for navigation only, and the other a series of high navigation dams for navigation, flood control, and power.

The Chief of Engineers recommended to Congress that if the States, municipalities, or private agencies would build higher dams, the Federal Government should commit itself to share the cost to the extent of the cost of the low dams to be displaced. Under such a plan, 32 low dams would be displaced by 7 higher ones. The Congress, in the Rivers and Harbors Act of 1930, definitely committeed the United States Government to contribute to the cost of the higher dams the saving that would be made by not building the lower dams.

Mr. Thurston: Your philosophy in relation to this project is that of the $343,000,000, one-half of the charge should be allocated to flood control, and the other $170,000,000 should be allocated to navigation.

Dr. A. E. Morgan: No, sir; you asked what expenditure would be justified by flood control and by navigation.

Pp. 129-31

The Chairman: You said awhile ago that these dams on the Tennessee River and its tributaries had a powerful effect on flood prevention in the Mississippi River.

Dr. A. E. Morgan: Yes, sir.

The Chairman: I wish you would state how many acre-feet of water all of the dams on this project, when completed, could hold back from the flood waters of the Mississippi River.

Dr. A. E. Morgan: It will take a minute or two to calculate it.

The Chairman: Suppose you insert that in the record.

Dr. A. E. Morgan: I will do that.

(Since the close of these hearings the data requested have been published in the Authority's report on the Unified Development of the Tennessee River System, at p. 19. See also the table inserted at p. 123 of these hearings.)

Mr. Taber: Along with that, incorporate a statement showing what the total flow is, so we can estimate what the proportions are.

The Chairman: There are three rivers emptying into the Mississippi that contribute largely to its flood waters—

namely, the Arkansas, the Ohio, and the Tennessee. As I understand it, they are the main tributaries of the Mississippi that cause floods.

Dr. A. E. Morgan: Yes, sir. The Red River comes in below, and contributes to the floods to a less degree.

The Chairman: Which one of those rivers contributes the greatest flow of flood waters to the Mississippi?

Dr. A. E. Morgan: The Ohio River, which includes the Tennessee, causes the greatest flood damage in the aggregate.

The Chairman: Which contributes the most, the Ohio River or the Tennessee?

Dr. A. E. Morgan: I think it would be the Ohio where the two rivers come together. I think the Ohio would sometimes have a bigger flow than the Tennessee. Sometimes one contributes more, sometimes the other.

[fol. 4397] The Chairman: Which has the greater influence on Mississippi floods, the Ohio or the Arkansas?

Dr. A. E. Morgan: The Ohio comes in much farther up the river than the Arkansas, so there is a large part of the river that is not affected by the Arkansas that is affected by the Ohio.

The Chairman: Which is the larger river at Paducah, the Ohio or the Tennessee?

Dr. A. E. Morgan: The Ohio has a larger flow.

The Chairman: Which has the greater drainage area? Does the Ohio have the greater drainage area and greater rainfall?

Dr. A. E. Morgan: The Ohio has the larger drainage area, but the Tennessee area has the heavier rainfall.

Mr. Taylor: What is the distance between the mouth of the Ohio and its junction with the Tennessee?

Dr. A. E. Morgan: It is about 40 or 50 miles.

Mr. Taylor: That does not amount to much so far as flood works are concerned.

Mr. Cannon: The Missouri is longer than any other tributary of the Mississippi.

Dr. A. E. Morgan: Yes, sir; but it brings its waters in at a time of the year when the crest has passed the other areas, and it drains a great area of light rainfall. The effect of the Missouri on the Mississippi is less than that of the Ohio or Arkansas.

Mr. Taber: How does the rainfall up here at Norris Dam compare with that down along the Mississippi Valley? Are the rainfalls heavier or lighter?

Dr. A. E. Morgan: The rainfall above the Norris Reservoir is heavier than that of the part of the Mississippi which lies to the north of the Tennessee, but lighter than the rainfall of the drainage area south of the Tennessee.

Mr. Taber: You get the most of it from the hills?

Dr. A. E. Morgan: Yes, sir.

Mr. Taber: You very seldom get any heavy rainfalls over in these mountains in the East, in Tennessee, and in the west end of North Carolina at the same time the rains are falling on the other side of the Mississippi, do you?

Dr. A. E. Morgan: You do not often, but once in a while you may.

Mr. Taber: It takes a considerable time for water to flow from such a place as Norris Dam, or such places as you have been operating on, down into the Mississippi, and then down into the levee territory, does it not?

Dr. A. E. Morgan: Yes, sir.

Mr. Taber: How long would it take ordinarily for a flood tide of water to flow from Norris Dam over into the levee territory on the Mississippi River?

Dr. A. E. Morgan: About 2 weeks from the highest reservoir.

Mr. Taylor: It is a rapid stream.

Dr. A. E. Morgan: Yes, sir; it is a rapid stream.

Mr. Taber: A flood tide from any of the other rivers would get into the levee territory in 4, 5, or 6 days, would it not?

Dr. A. E. Morgan: From the Missouri, it might be 6 weeks.

Mr. Taber: How rapidly a flowing river is the Arkansas?

Dr. A. E. Morgan: The waters of the Arkansas would come down at about the same time.

Mr. Taber: About the same time as the waters of the Tennessee.

Dr. A. E. Morgan: Yes, sir.

Mr. Taber: You mean it takes as long for the water to come down the Arkansas as down the Tennessee?

[fol. 4398] Dr. A. E. Morgan: The Arkansas River rises

in Colorado, but the major part of the rainfall in its drainage basin comes within 500 miles of the mouth of the river.

Mr. Taber: Then, it does not take very long.

Dr. A. E. Morgan: I would say that from a large part about the same length of time would be required as from the area above Norris Dam.

Mr. Taber: How far is it from the Norris Dam into the levee territory of the Mississippi?

Dr. A. E. Morgan: About 700 miles.

Mr. Taber: If the levee territory does not begin at the mouth of the Ohio——

Dr. A. E. Morgan (interposing): Cairo has the highest levees on the Mississippi. If it had been confined within levees, the water would have risen to 58.5 feet at Cairo in the 1927 flood.

Mr. Taber: That is the big source of the floods in the Mississippi—that is, waters coming out of the Ohio.

Dr. A. E. Morgan: The Ohio is looked upon as controlling floods on the Mississippi, or as the biggest element.

Mr. Cannon: Has that height varied in the last 50 years appreciably?

Dr. A. E. Morgan: Yes, sir; it is higher than it used to be. The levees have been raised, and the water cannot get away. For instance, in the twenties, the reports of the Chief of Engineers each year said that the Mississippi River is now permanently safe from floods. I think 3 years after that report first came out, and about 2 weeks after the report was printed in 1927, a flood came along that tore the levees to pieces.

Pp. 131-3

Mr. Taber: To what extent will these dams reduce the flood hazard, first, in the Mississippi, and, second, in the lower reaches of these rivers?

Dr. A. E. Morgan: In the case of the Mississippi, no single tributary is ever controlling. If you could control the other tributaries as well as we are controlling the Tennessee, you would have the job done.

Mr. Taber: In other words, floods are due to the flood waters that go in from the Tennessee, the Ohio, Arkansas,

and Red, but taken by themselves, no one of those rivers would create a serious situation at any one time, if there were no flood waters coming from some of the others.

Dr. A. E. Morgan: That is not quite the case. If you take the stretch from Cairo, Ill., down to the mouth of the Arkansas, or a distance of some 100 miles below the Arkansas alone would have practically nothing to do with it if the Ohio were controlled. If you should go below there, it would be possible to have a flood out of the Arkansas, and a big one, but it would not be so big as to be troublesome if the Ohio were controlled.

Mr. Taber: Have you estimated the amount of water coming down this river at flood times?

Dr. A. E. Morgan: Yes, sir; the flow of the Tennessee River was about 430,000 cubic feet per second at Chattanooga, and about 500,000 cubic feet per second at its mouth in the maximum flood of record.

Mr. Taber: How much of the flood will be taken off of that maximum by the work that you already have under construction?

Dr. A. E. Morgan: Roughly one-quarter. It would take off about 100,000 cubic feet per second.

[fol. 4399] Mr. Taber: That would be over a period of how long a time? This 100,000 cubic feet per second will fill up the dams in what length of time?

Dr. A. E. Morgan: It is not so simple to answer as that. As you get into the engineering factors, you will find it difficult to answer that in simple language. The Tennessee is so close to the Mississippi that with a warning such as was given in the present flood in the upper Ohio, the gates could be let open ahead of the flood and the water could be let out. We would lower our reservoirs on the lower Tennessee and get them empty so as to have the storage space available for the time they would be needed when the flood comes down from above. On the other hand, at the headwaters, we would close the gates at the beginning of a period of heavy rainfall, so a very large degree of control could be secured. The lower reservoirs are not used until needed, or right up to the time when the flood crest comes. Further up, as soon as the floods begin the gates are closed.

The Chairman: It depends on when it reaches the lower river.

Dr. A. E. Morgan: Yes, sir.

Mr. Taber: Then, that would mean that all those dams will be operated on some supposed level, or that they will always be kept less than full in ordinary operations, so as to be ready to meet that situation.

Dr. A. E. Morgan: It is not necessary to do that. The Gilbertsville Dam, the lowest proposed dam on the Tennessee, can be used for illustration. We could keep that reservoir full all the time until we knew a flood was coming, because there we have plenty of time to empty it, before any flood crest would reach the lower river.

Mr. Taber: In other words, the local drainage area is not heavy——

Dr. A. E. Morgan (interposing): That is not the point.

Mr. Taber: The local drainage is not serious.

Dr. Morgan: No, sir; you do not get my meaning.

Mr. Taber: I do not think you got the meaning of what I said.

Dr. A. E. Morgan: The point is this: Suppose we have stored 3 or 4 million acre-feet. There is fine storage right at the end of the river. This Gilbertsville Dam would have wonderful storage.

Mr. Taber: You told us you would open that and let it out when you thought a flood was coming?

Dr. A. E. Morgan: Yes, sir.

Mr. Taber: And you said that, in other words, the local drainage into that dam was not heavy enough so that your situation generally would be upset because of that operation?

Dr. A. E. Morgan: Yes.

But it is a problem of so relating the operation of the upper and lower dams that the full benefit of the whole system can be realized. For instance, the Gilbertsville reservoir could be kept full, and the local drainage would not amount to anything. It could be emptied in time to be ready for flood water from above. At the Norris Reservoir, on the other hand, at this time of the year, say the 1st of April, the time has passed when a great flood is apt to originate in the hills; so we can begin to store water and fill it up. We know during what seasons great floods originate of the kind which affect the Mississippi, and we can manage the Norris Reservoir to get the greatest benefit.

APPENDIX "G"

[fol. 4400] P. 133

Mr. Cannon: You speak of a storage dam for flood relief and other purposes. What other purposes besides flood and power is it available for?

Dr. A. E. Morgan: For instance, the Norris Reservoir that we have there has 3,400,000 acre-feet of storage, one of the largest reservoirs in America. Now, during low water, when the Tennessee and Mississippi Rivers run low, we can let that water out and raise the water level for navigation; and below each one of our dams, if we have this storage controlled so we can release it at low water, we can save expensive dredging that otherwise would be necessary for navigation.

(Here follows one photolithograph, side folio, 4401)

PRESENT AND PROSPECTIVE IMPROVEMENTS IN NAVIGATION

(See p. 138)

The CHAIRMAN. Now, we want a statement as to the present and prospective navigation on this river as the improvements proceed. What is the navigability of the river now, as to depth, height, and so forth?

Dr. A. E. MORGAN. The river now, below Wilson Dam, has a limit of navigable depth of about 4 feet.

The CHAIRMAN. Below Wilson Dam to the mouth?

Dr. A. E. MORGAN. Yes, sir.

The CHAIRMAN. How many miles is that?

Dr. A. E. MORGAN. It is 260 miles. That does not mean that it is all that shallow, but the controlling depth is about 4 feet.

The CHAIRMAN. I understand. Then that 260 miles from Wilson Dam down is 4 feet?

Dr. A. E. MORGAN. The controlling limit is 4 feet.

From Wilson Dam up to Chattanooga, about 205 miles, the controlling depth is 3 feet. From Chattanooga to Knoxville, which is about 184 miles, the controlling depth is 1 foot at present.

The CHAIRMAN. That is no navigation at all?

Dr. A. E. MORGAN. Only in high water.

The CHAIRMAN. Now put in the record a detailed statement of the present and prospective development of this navigation, as to depth, as these dams and reservoirs are erected.

Dr. A. E. MORGAN. Yes, sir.

(The statement requested is as follows:)

Status of channel depths on Tennessee River

Successive pools of main river projects	From Paducah to Gilbertsville	Gilbertsville pool	Pickwick pool	Wilson pool	Wheeler pool	Guntersville pool	Hales bar pool	Chattanooga to Chickamauga	Chickamauga pool	Watts bar pool	Coulter Shoals pool (to head of river above Knoxville)
Length of pools (miles)	22.6	184.1	52.7	15.5	74.1	82.1	33.0	6.9	58.9	73.6	68.6
Project and river miles from mouth	Minimum channel depth (in feet) at ordinary low water, after completion of each project										
Depths prior to Tennessee Valley Authority construction	12.0	4.5	4.0	12.0	3.0	3.0	[1] 12.0	[2] 4.0	1.3	1.0	1.6
Wheeler, mile 274.9	(3)	5.0	5.0	(3)	12.0	3.0	(3)	4.0	1.3	1.0	1.6
Norris	(3)	5.0	4.1	(3)	(3)	4.6	(3)	5.8	3.4	1.0	1.6
Pickwick, mile 206.7	(3)	5.1	[1] 12.0	(3)	(3)	4.6	(3)	5.8	3.4	1.0	1.6
Guntersville, mile 349.0	(3)	5.2	(3)	(3)	(3)	12.0	(3)	5.8	3.4	1.0	1.6

Raising Hales bar pool	(3)	(3)	(3)	(3)	(3)	(3)	(3)				

[1] With flashboards up at Hales bar. [2] After improvement of Florence Canal. [3] Project depth.

The pools across top of table are listed in succession from the mouth to the head of river. The projects to the left are listed in chronological order for construction. Reading horizontally from the left the resulting depth in each pool is shown, following the construction of a given project.

Norris, Fontana, and Fowler Bend, being storage projects on tributaries, increase the depths in unimproved sections by storage release in low-water season. This also maintains the low-water depth at the heads of pools and the storage of flood water reduces pool fluctuations during floods.

After a minimum depth of 12 feet has been obtained, the table shows "project depth." Depths shown are minimum gross channel depths. The 12-foot depth provides 3 feet of overdepth for the 9-foot draft required for the navigation project.

APPENDIX "G"

[fol. 4402] P. 136

Mr. Bacon: What is the other one?

Dr. A. E. Morgan: That is at Gilbertsville. That will back the water up 184 miles, across the State of Kentucky and the State of Tennessee.

Mr. Taber: There is not much drop there in that terrain, then?

Dr. A. E. Morgan: No, sir.

Mr. Bacon: What will that Gilbertsville Dam cost?

Dr. A. E. Morgan: The Gilbertsville Dam will cost about $60,000,000, unless extra storage for Mississippi flood control is provided, in which case the cost would be $14,000,000 more than that.

Mr. Taber: And how high would it be?

Dr. A. E. Morgan: It would be about 60 feet.

There is a possibility of raising the Gilbertsville Dam somewhat more; not because navigation needs it, but because you could get the cheapest flood-control storage that you could anywhere on the Mississippi system by raising it about 8 feet, if that were desirable.

Mr. Taber: That would make more power, too?

Dr. A. E. Morgan: It would make some more power, but that is not so important there as flood control. It would be principally flood storage. You would not be saving that for power.

Pp. 138-40

The Chairman: You did not finish on the navigation. You got off on a particular dam. The last I heard of navigation before these particular dams came up was that there was 3 feet between Wilson Dam and Chattanooga.

Dr. A. E. Morgan: With the completion of our system we would have a minimum of 9 feet of draft.

The Chairman: To where?

Dr. A. E. Morgan: From Knoxville to the Ohio River.

The Chairman: Now, you had 3 feet before. What is the next depth you are going to have; the next step you are going to have in navigation?

Dr. A. E. Morgan: Nine feet draft.

The Chairman: How far up the river?

Dr. A. E. Morgan: If this program——

The Chairman: I am not talking about the whole program. Certainly the completion of one or two dams, or the ones that are now started, will add to navigation somehow.

Dr. A. E. Morgan. The completion of the Pickwick Dam project will give us 9 feet up to Wheeler Dam, and the completion of Wheeler Dam will give us 9 feet up to Guntersville.

The Chairman: From the mouth?

Dr. A. E. Morgan: The completion of Guntersville, which is now under way, will give us 9 feet up to Hales Bar. From the mouth it will be 9 feet except at the lower end below Pickwick and in the Florence Canal between Lock No. 1 and Wilson Dam.

The Chairman: You have not got up to above Chattanooga. What is that dam up there—Chickamauga?

Dr. A. E. Morgan: Yes; that is Chickamauga Dam. That will give us 9 feet except as I just stated, and as soon as the lower dams are finished it will be 9 feet all the way from the mouth. That will give us that depth up to near Rockwood, in the iron, coal, and limestone region. We have some of the big iron possibilities of America there, I am told.

The Chairman: And the completion of your Hiwassee Dam does nothing except as a stand-by reservoir to help this navigation at low water.

[fol. 4403] Dr. A. E. Morgan: Navigation and flood control; yes. Each dam as it is completed gives 9 feet draft above it.

The Chairman: Then with the dams now under way you will have not less than 7-foot depth up above Chattanooga?

Dr. A. E. Morgan: Yes, sir.

The Chairman: To where?

Dr. A. E. Morgan: To about Rockwood.

The Chairman: And about how many miles above Chattanooga?

Dr. A. E. Morgan: About 70.

Now, there is one little gap in there that I have not described. The Hales Bar Pool, which is below Chattanooga, will have to be raised or considerable dredging will have to be done in between, or a low-navigation dam built.

The Chairman: That will not be expensive?

Dr. A. E. Morgan: About $4,000,000.

The Chairman: What will have to be done, then, to give navigation to Knoxville?

Dr. A. E. Morgan: There will have to be two more dams.

Mr. Chairman: Where will they be?

Dr. A. E. Morgan: At Watts Bar—which was called White Creek before—and Coulter Shoals. Those will give navigation to Knoxville.

The Chairman: How many feet?

Dr. A. E. Morgan: Nine feet draft except at the points I indicated.

The Chairman: Is the dam at the mount of the Tennessee necessary for nine feet draft?

Dr. A. E. Morgan: Yes, sir.

The Chairman: At a cost of $160,000,000?

Dr. A. E. Morgan: No; only $60,000,000—the Gilbertsville Dam.

The Chairman: That is necessary for 9 feet?

Dr. A. E. Morgan: Yes, sir.

The Chairman: So, under the present program, we are aiming at 7 feet navigation up to Knoxville?

Dr. A. E. Morgan: No; 9 feet. This Gilbertsville Dam on the Tennessee itself, not on the Ohio——

The Chairman (interposing): You have not got an estimate for that, have you? That is not included in this estimate?

Dr. A. E. Morgan: It is included in our total estimate; yes—not for appropriations this year.

The Chairman: I understand. It is included in your total estimate; it is included in your entire plan. But I am talking about the estimate that is before us now.

Dr. A. E. Morgan: For next year?

The Chairman: Yes.

Dr. A. E. Morgan: No; it is not included in that.

The Chairman: We are working now for the next goal of 7 feet up to above Chattanooga.

Dr. A. E. Morgan: Nine feet draft above Chattanooga.

The Chairman: Then in order to get 9 feet from the mouth it would take $60,000,000 for the Gilbertsville Dam and the two dams, Coulters Shoals and Watts Bar?

Dr. A. E. Morgan: About $50,000,000 more.

The Chairman: About $50,000,000 more; to give you 9 feet clear up to Knoxville?

Dr. A. E. Morgan: Yes, sir. We have now, with the finishing of the dams that are now being built, 7 feet depth up to Pickwick and 9 feet draft from there to above Chattanooga. It is only below Pickwick that we would have 7 feet depth; the rest of the way it is 9 feet draft as required for the 9-foot project.

The Chairman: In other words, you need water high up? [fol. 4404] Dr. A. E. Morgan: Yes, sir.

The Chairman: That is just because some of the dams are not backed up?

Dr. A. E. Morgan: It is just because the lower dam is not completed—the one at Gilbertsville, way down below.

The Chairman: Have you any record of what the difference in benefit to navigation is—I mean, that is actually and practically put into effect—between 7 and 9 feet?

Dr. A. E. Morgan: This is the difference: This 9-foot channel on the Tennessee is part of a 9-foot channel from Pittsburgh down to the Mississippi and on down to the Gulf, and from St. Paul down the Mississippi all the way, and from Chicago down the Illinois River all the way. About 5,000 miles is being built to a channel, for boats with a 9-foot draft. If a certain section there has only 7-foot depth, you have to have a different class of craft on it.

The Chairman: You are sure about the boats being built for a 9-foot channel?

Dr. A. E. Morgan: I say they are going to be built for the channel that is provided. The Government for years past has set a 9-foot draft channel as the standard. Now, if it is the standard in all parts of 5,000 miles of waterway except on the lower Tennessee, then the boats that are built for the rest of the system cannot effectively use that part. That is the difference.

The Chairman: There ought to be another difference. There ought to be a difference in the capacity of the boats; because a 9-foot channel ought to carry a greater tonnage in one load than a 7-foot channel.

Dr. A. E. Morgan: The difference is even more than I have indicated, because, as it is now, that 7 feet is just dragging on the bottom of the river, and a boat with a 7-foot draft would scrape the rocks on the bottom of the river; whereas our 9 feet is 9 feet of draft, with about 3 feet under it. So it is really comparing about 7 feet with 12 feet.

The Chairman: Nine feet of free water?

Dr. A. E. Morgan: Yes, sir; water for boats of 9-foot draft, with 3 feet of water underneath.

P. 195

Dr. A. E. Morgan: There is a silting problem there, and some small reservoirs have largely silted up since they have been built. They are very small ones. We are undertaking as part of our program, to stimulate agricultural change, to get land out of plow crops into grass crops, and we are already affecting that situation. But our storage reservoirs are large enough so that if it takes a hundred years to change that culture back we still will not have lost much. We are making definite provision for silt deposit in the design of each storage reservoir on the tributaries.

P. 196

Dr. A. E. Morgan: Then we are making very careful studies of the silt deposits on all the rivers where we are planning to build dams.

Mr. Thurston: Is it possible that some very important plant may be erected at a given point, we will say near a dam, and that it will really, in a few years, become almost valueless because the storage has diminished so greatly?

Dr. A. E. Morgan: No; we are building no structures that would be menaced in the next century. We are working into a program of erosion control for a long-time program.

[fol. 4405] P. 205

Mr. Taber: It is a question of adding and subtracting.

Dr. A. E. Morgan: It is not a matter merely of adding and subtracting. We can protect Chattanooga locally only by levees. That is the only way to protect it locally. Now, if we should build levees that would take care of the 1917 flood, and build them so that the city would consider itself safe to build behind them, then, if a big flood should come along, the city would be much worse off than if it had not provided that protection. Therefore, before we are safe in building levees at Chattanooga, we must be sure that we are going to be in a position of holding extreme flood stages down to a point where the levee will not be overtopped.

We have no business building levees that will be overtopped once in a while, because that might largely destroy the city. It would be worse off than if it had no levees. Now, it is impossible to build levees high enough to give that protection without first providing reservoir control. If we can first cut big floods down to reasonable limits, then we can safely build levees, but we do not dare to build them if they are to be overtopped. If levees are built, and people build behind them, and they are liable to be overtopped, they are worse off than if they had no levees.

Pp. 211-12

Mr. Taber: Are you planning to have a power lay-out at this dam?

Dr. A. E. Morgan: No, sir; not at present.

Mr. Taber: Is this a navigation dam, or is it a power dam primarily?

Dr. A. E. Morgan: It is a navigation and flood-control project. There is a possibility of power whenever it is justified.

Mr. Taber: How many acre-feet of water will there be in this reservoir?

The Chairman: Three hundred thousand acre-feet of storage will be available for flood control, according to the statement, and the elevation is 595 feet.

Mr. Taber: What territory does this dam protect against floods?

Dr. A. E. Morgan: The storage given for flood control is 300,000 acre-feet.

Mr. Taber: What territory below is protected by this dam?

Dr. A. E. Morgan: It will primarily affect the Mississippi.

Mr. Taber: The lower Mississippi.

Dr. A. E. Morgan: Yes, sir. It will have its effect all the way along but its primary effect will be on the Mississippi.

Mr. Taber: It is not a major item so far as flood control on the Mississippi is concerned, is it?

Dr. A. E. Morgan: There is scarcely any such thing as a major item in flood control in the Mississippi. It must be an accumulation of various items to relieve the Mississippi.

Mr. Taber: This provides how much water back to Chickamauga?

Dr. A. E. Morgan: It will provide 9 feet. It does not go back to Chickamauga, but it goes to Hale's Bar, which is a private dam below Chattanooga. It will provide 9 feet there, up to Hale's Bar.

Mr. Taber: That is how far?

Dr. A. E. Morgan: About 82 miles.

Mr. Taber: How far is it from Hale's Bar back to Chickamauga?

Dr. A. E. Morgan: About 30 miles.

[fol. 4406] P. 226

The Chairman: Is it for navigation alone, or for navigation and power?

Dr. A. E. Morgan: It is flood control and navigation.

The Chairman: No power in it at all?

Dr. A. E. Morgan: It would have power possibilities, though we are not estimating for power at present.

The Chairman: How near is the Norris Dam to it?

Dr. A. E. Morgan: About 74 miles.

The Chairman: Watts Bar is not on the Tennessee River, is it?

Dr. A. E. Morgan: Yes. That is the same as White Creek. That is on the Tennessee River. Above Chattanooga you first come to the Chickamauga Dam, then to the Watts Bar Dam, and then to Coulter Shoals Dam.

Mr. Taber: How far is it to Watts Bar from Chickamauga?

Dr. A. E. Morgan: That is about 59 miles.

Mr. Taber: According to the way they have got this laid out for me, which was put on by somebody here, it is only about half as far from Watts Bar to Coulter Shoals as it is from Chickamauga to Watts Bar.

Dr. A. E. Morgan: Fifty-nine miles is the length of the reservoir above the Chickamauga Dam, and it is 74 miles from Watts Bar Dam site to Coulter Shoals Dam site. The pool of Watts Bar would be 74 miles, and Coulter Shoals is 53. The Coulter Shoals Dam would make the Tennessee River navigable for 4 miles above Knoxville, to where it is formed by the junction of the French Brook and Holston Rivers.

The Chairman: Coulter Shoals is not above Knoxville?

Dr. A. E. Morgan: Coulter Shoals is about 45 miles below Knoxville, on the main river.

P. 235

Maintenance of Stream-Flow Stations

Dr. A. E. Morgan: I have a map indicating the stream-flow stations that we are working on.

The Chairman: Suppose you finish your break-down.

Dr. A. E. Morgan: In the matter of rainfall we are co-operating with the United States Weather Bureau, and we have established 189 rainfall stations throughout the area, in addition to those of the Weather Bureau. We need those for our weather forecasting, for building our dams, and for operating them afterward.

I have a map indicating the locations and the amount of rainfall.

The Chairman: Do you expect to maintain all of those stations?

Dr. A. E. Morgan: Not all of them, but we will maintain part of them until we get a good record of that section of the country. Some of them we will maintain permanently.

The Chairman: You have regular men stationed there, or are they mostly accommodation men?

Dr. A. E. Morgan: They are men who go out in the morning and in the evening, farmers who live near by.

The Chairman: Do you pay them for it?

Dr. A. E. Morgan: Yes; it varies, depending on how far away a man lives. We are working out a process now that seems to be satisfactory, of radio recording whereby you put a battery in the station with a little radio outfit, and that information is transmitted by radio. Then we hope to develop a radio receiving outfit in our office, so there is need for nobody to look after the station. It would work automatically. About once in 6 months it would be necessary to put in another battery. We hope in time to have automatic recording for those stations.

[fol. 4407] The Chairman: Recording of what?

Dr. A. E. Morgan: We worked that up particularly for the water stages. We can use it also for temperature and for rainfall.

The Chairman: That is, you mean the stage of the water in the river?

Dr. A. E. Morgan: Yes. Then there are silt investigations. We are working on the question as to how fast reservoirs will silt up.

The Chairman: It seems to me you ought to be working on the question of how to stop erosion.

Dr. A. E. Morgan: To do that we have to get some measurements as to the kind of problem we are handling.

Studies of Silting of Dams

When we went down there we had estimates on the Norris Dam ranging all the way from a hundred to two thousand years as to the time it would take to silt the dam. That is the range within which the engineers were guessing. We are making studies to know what our problem is.

The Chairman: You are still guessing?

Dr. A. E. Morgan: We are guessing, but within narrower limits as we secure definite data.

[fol. 4408] APPENDIX "H"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 116, being "Hearings Before the Subcommittee of the Committee on Appropriations, House of Representatives, 75th Congress, 1st Session."

Page 341

Dr. Arthur E. Morgan: • • •

For instance, in connection with the Norris Dam, all during the flood on the Ohio during this last winter we completely closed the gates of the Norris Dam and stored about a million and a half acre-feet of water, enough to make a substantial difference in river stages below.

It is quite probable that the Norris Dam saved the city of Cairo. There were two towns there side by side, Cairo and Mound City, each surrounded by levees. The Mound City levee failed and the Cairo did not. It was by taking the action we did at the Norris Dam that the flood stage at Cairo was reduced by about 6 inches.

The Norris Dam did not cut down the flow quite enough to save Mound City, but did cut it down enough to save Cairo.

Pages 341-2

May I take up the matter of the general planning of the system?

We have there a river system draining somewhat more than 40,000 square miles. For 650 miles of that river, from Knoxville to its mouth, the Government has adopted a policy of making it navigable with a channel for vessels of 9-foot draft, which means 12 or 13 feet minimum depth of water. It is necessary to have storage for regulating navigation stages and for flood control, and incidentally it is valuable for power. The further we can see ahead, the more accurately we can appraise the total possibilities, and the better we can design each particular project and determine the feasibility and the cost of the several possible dams. We must determine whether it is better to make a dam higher on the main river or to get some storage on the tributary streams, and how large the dams on the tributary streams should be as parts of the single unified system.

In the general development of such public works in this country such thoroughgoing studies as we are making would have saved their cost many times over.

During the course of more than 50 years the official estimates of the total cost of the Mississippi flood-control system, made by those in responsible charge, have been, in general, several hundred per cent in error from the first official estimate in 1874 down to the 1927 flood. An estimate would be carried for years until a flood would demonstrate its inadequacy, then a revised and enlarged estimate would [fol. 4409] be made and carried until another flood would bring about a further revision. That is not the best way to plan a great program. With proper planning it is possible to eliminate a very large part of that learning by catastrophe. We can learn better by thoroughgoing engineering study.

Page 360

Mr. Taber: What jobs on the river are for flood control, do you think?

Dr. Morgan: Different degrees in various cases. The Gilbertsville project is especially valuable for flood control. In fact, I think that the whole cost of the Gilbertsville Dam and Reservoir would be justified for flood control alone, and that is the largest unit in the entire project.

Pages 367-8-9

Mr. Boylan: What is the nature of the navigation on the river now?

Dr. Morgan: It is very largely prospective, for the reason that both above and below this there are rocks and shallows that largely prevent navigation. The Gilbertsville and Pickwick Dams will carry vessels of 9-foot draft up to the Wilson Dam, and these other dams will carry it above. Above there we have a low-water depth of a foot and a half. That will be made a low-water depth of 12 feet by the Guntersville Dam.

There cannot be any extensive navigation until the dams are built. It is somewhat like saying, "I want to build a railroad through this country; how much did that railroad carry last year?" before it was built.

We have made very careful studies of what we considered to be the conservatively probable traffic on that river.

Mr. Boylan: What kind of traffic?

Dr. Morgan: It will be coal, oil, gasoline, bauxite, aluminum oxide, phosphates, steel, lime, minerals, marble——

Mr. Boylan: These shipments just affect the Tennessee Valley development, do they, or will you get them from further up the river?

Dr. Morgan: There will be shipments from further up the river when navigation is made feasible.

Mr. Boylan: But that is purely speculative?

Dr. Morgan: Not any more speculative than any economic development. Until your store is actually built, or your hotel, it is speculative whether it is going to produce. We think that freight savings of from $1 to $1.25 a ton will be possible just as soon as water-carrying can be provided, and that if that waterway had been available for operation for the past 5 years, so that boats could have been built and put in operation, today, it would be carrying about 6,000,000 tons of freight, with a saving of $1 to $1.25 a ton.

[fol. 4410] Mr. Boylan: Is that from the valley itself—from the Tennessee Valley—or from further up the river?

Dr. Morgan: It would include both. The traffic would be down the Ohio and up the Tennessee and down the Mississippi. It would have its share of the traffic of the Mississippi River system.

Mr. Boylan: What is the nearest terminal now on the river to the TVA?

Dr. Morgan: On the Tennessee?

Mr. Boylan: Yes.

Dr. Morgan: We have terminals there now.

Mr. Boylan: Before you reach the TVA, how far do they come down?

Dr. Morgan: The TVA takes in the entire Tennessee River area.

Mr. Boylan: I am trying to find out how far under your existing navigation a ship can navigate the river. Can you navigate it at all?

Dr. Morgan: Yes. Last year's movement was about 2,000,000 tons. It is used, and has been extensively used in the past, but under great difficulty because of the shallows.

Mr. Boylan: How far is it used, and to what point?

Dr. Morgan: Cement is hauled from the Mississippi River up the Ohio and up the Tennessee for about 400 miles, and then you cannot go any further because of shallows.

Mr. Boylan: Is that clear navigation up to the confines of the TVA, that 400 miles?

Dr. Morgan: You see, the whole of the Tennessee River is in the TVA area.

Mr. Boylan: What I am trying to find out is whether or not there is any navigation on the river now, and where it is coming from.

Dr. Morgan: Some comes from within the Tennessee Valley, and some comes from the Ohio River and the Mississippi River.

Mr. Boylan: What is the nature of the articles transported?

Dr. Morgan: Steel, cement, crushed limestone, gravel, oil, gasoline.

Mr. Boylan. When they reach the terminal—that is, as far as they can go now—what is done with each shipment?

Is there a terminal there where they have to transship by rail, or what?

Dr. Morgan: No; there is not, because it is just coming into existence. There are little terminals, but they are not modern at all. Where you have only a foot and a half of water, you do not have much navigation. They just run up in the high water, and run up to a bank or small terminal. There are lumber companies that use the lower river for shipping their lumber out.

Mr. Boylan: Can they get it out?

Dr. Morgan: Yes; except in low water.

Mr. Boylan: How far can they get it out?

Dr. Morgan: The biggest shippers now are about 200 miles upstream from the mouth of the river.

Mr. Boylan: But they can ship only 200 miles?

Dr. Morgan: That takes the shipment to the Ohio River, where there is a 9-foot depth.

[fol. 4411] Mr. Boylan: Then what do they do with their merchandise?

Dr. Morgan: They ship 200 miles on the Tennessee, and then take it up and down the river, on the Mississippi and the Ohio. I think that this will answer your question—there is approaching completion today an inland navigation system on the Mississippi and its tributaries. It is not now in existence; but if no interruption occurs, 5 or 10 years from now it will be in existence and that will provide a channel for vessels of 9-foot draft downstream from St. Paul on the Mississippi, from Chicago on the Great Lakes, from Pittsburgh on the Ohio, and from Knoxville on the Tennessee down the Ohio and down the Mississippi, and there will be five or six thousand miles of such channel.

Now, the people of America are not fully aware of what happened to the middle of the United States when the Panama Canal was built. It has brought a paralysis to the interior of the United States. The Pacific and the Atlantic coasts have grown rapidly, while the interior of the country has gone back or largely stood still. The State of Iowa has actually lost in population, I believe. Missouri has largely stood still. The interior of our country cannot thrive until you have transportation more nearly on an equality with the rest of the country.

Mr. Boylan: You might say, then, that prior to the advent of the TVA there was no navigation on the Tennessee River?

Dr. Morgan: There was and has been considerable navigation, but under great difficulty.

Mr. Boylan: But practically prohibitive navigation?

Dr. Morgan: Yes; except for the lower river; because the river got down to a depth of a foot and a half. Here is a map; those dark lines are the lines of navigation that are being completed now.

Mr. Boylan: Can you get through to the Gulf now?

Dr. Morgan: Yes.

Mr. Boylan: From the Tennessee Valley?

Dr. Morgan: Yes.

Mr. Boylan: From the Tennessee Valley?

Dr. Morgan: Yes.

Mr. Boylan: What is the mean depth of the water?

Dr. Morgan: Below Wilson Dam it gets down to 3 and 3½ feet.

Mr. Boylan: You can use barges, canoes, and things like that?

Dr. Morgan: With the finishing of Pickwick Dam the minimum depth below Wilson Dam will be probably 5 feet, and with the completion of the Guntersville job the minimum depth will be 12 feet.

Mr. Boylan: At low water?

Dr. Morgan: At low water.

Mr. Boylan: Then you can use fair-size schooners and barges?

Dr. Morgan: Anything that can go in interior waters will travel there.

Mr. Boylan: But this will all be in the future?

Dr. Morgan: I think that within 5 years of the completion [fol. 4412] of this improvement it can be a reality. As to the possible navigation after the completion of the channel, we have made very careful estimates, of which the details are available. We believe that almost immediately on the completion of these dams we will have a traffic of about 6,000,000 tons on the river, and we will save somewhere between $1.10 and $1.25 a ton of freight on all of that traffic.

Mr. Ludlow: How much of that traffic will be outgoing and how much incoming, the relative percentage?

Dr. Morgan: I will give you that in just a moment.

That traffic of 6,000,000 tons would be the immediate result. We have two or three of the ablest men on water transportation in the country on our staff. They report those figures. They believe that within 20 or 25 years that traffic would at least double. We have great mineral resources, great resources there that simply cannot be used at the present time. The freight rates are extremely adverse to that region, and my personal belief is that when water transportation gets to going well the railroads will actually benefit by it because anything that brings about the general prosperity of that country will mean more business for the railroads. Each type of transportation will have its own business.

Page 374

Dr. Morgan: The operation of Norris Dam differs substantially from that of Wilson Dam or the Wheeler Dam. Norris Dam will be held at low elevations during the winter and during the first part of the flood season, so that the storage it gathers for power purposes will also be valuable for flood purposes. That is, during the fall we run the water down low and use up the power storage, and we hold it down there during the season when floods ordinarily occur, so that the same storage capacity that is good for floods is also good for power to some extent. During the latter part of the highwater season we close the gates and store the stream flow. A flood may occur and furnish part of that water supply. If not, the ordinary flow will do so.

Water Levels of Norris Dam

Then about the 1st of April the reservoir will be filled to the summer storage level, because we are almost sure that there will be no excessive floods later than that.

Page 375

Dr. Morgan: Yes. I am speaking in general terms. We have worked this out, and the management of that reservoir is one of the technical problems of the TVA, and the simple statement that I make would require qualifications as the problem is worked out in detail.

Mr. Taber: Your instructions to your operating division would naturally be on the basis of a current situation?

Dr. Morgan: Yes.

[fol. 4413] Mr. Taber: Rather than anything else. Your operating group would never get instructions from year to year?

Dr. Morgan: They would get general instructions, but if, for instance, we found that the ground was very dry in a certain year and would absorb much rain, if January had been an exceedingly dry month and the streams were empty, and so forth, we could assume an absorption of rainfall more than we could if it had been a wet month and the ground was full of water. Such practical facts would enter into determining current action.

Page 376-7-8

Dr. Morgan: We have made a report of the total situation with reference to that flood and the part that Norris Dam took in it, and the control exercised. We would like to include a copy of that report in the record, if we may.

(The report referred to is as follows:)

Flood-Control Activities of the Tennessee Valley Authority During Recent Ohio-Mississippi River Flood and Possibilities of Additional Flood-Control Benefits With Completion of Tennessee Valley Authority Program in Tennessee River System

During the flood of January 1937 the Tennessee Valley Authority dams were ready to be used for flood storage. The entire flow of the river above the Norris Dam was stored throughout the whole duration of the flood. The effect was substantially to lower flood heights on the lower Ohio and adjacent Mississippi.

No universal rule can be stated as to combination works for flood control, navigation control, and power development. With proper engineering planning and management, the various uses often can be combined in single structures with greater economy and effectiveness than can be secured by single-purpose developments. The possibility of combining varied purposes, and the economies resulting from such combinations, vary in different projects.

APPENDIX "H"

It is important to point out that during the recent flood on the Ohio and Mississippi Rivers the Authority had only three dams in operation—Wilson and Wheeler Dams, on the main Tennessee River, just above Florence, Ala., and Norris Dam, on the Clinch River, a headwater tributary of the Tennessee, 80 miles above its junction with the Tennessee. Wilson Dam, constructed before the Authority was created was not designed or built with provision for the storing of flood water. Therefore, only Wheeler and Norris Dams, both constructed by the Authority, were available for flood-control operations at the time of this flood. Norris Dam, one of three proposed tributary stream dams, completely controls the flood run-off from 2,950 square miles. This is about 7 per cent of the total area of the Tennessee River Basin. [fol. 4414] Wheeler Dam, one of nine proposed main river dams, has a total drainage area above it of nearly 30,000 square miles, with only about 500,000 acre-feet capacity for flood storage. This capacity in this single dam is wholly inadequate to afford complete control of the flood run-off from above.

Obviously, with these limited storage facilities available at present, nothing approaching adequate control of the floodwaters from the Tennessee River can be expected. The Authority not only does not claim to be able at present to effect such complete flood control, but it fully realizes its inability to do so. Moreover, it recognizes the need for the completion of the dams under construction and those proposed, both on the main stream and tributaries, if adequate flood-control benefits are to be achieved.

During the recent flood the water-control activities of the Authority were beneficial to flood conditions on the Ohio and Mississippi Rivers. Throughout the entire flood period during January the flood-storage space available at its two dams for flood-control purposes was utilized to the very best advantage. There were absolutely no other water uses during that period.

Norris Reservoir, after storing throughout the spring flood season of 1936, during which time Chattanooga in particular and the Tennessee River in general benefited through the material reduction of flood heights, was steadily drawn down during the dry season. This lowering of Norris began the middle of June and continued till early in

December, the releases being timed to best serve navigation on the lower Tennessee River to make ready for the flood season which usually begins during the latter part of December and lasts until the end of March or early in April. At the low point the reservoir was nearly 60 feet below the top of gates and had room for more than 1,500,000 acre-feet of storage, nearly all of which was actually used during the period of the Ohio-Mississippi flood in storing all the floodwaters above the dam. No water releases were made from Norris during the entire flood period in January. The flood-storage space in Wheeler Reservoir was also used to the best advantage during the flood period.

Engineers of the Authority kept in touch daily with the progress of the flood down the Ohio and into the Mississippi, using the long-distance telephone and other means at their disposal, and this gave them the information needed for the operation of their dams so as to be of the most benefit in the flood emergency on those rivers.

The flood at Cairo, Ill., at the junction of the Ohio and Mississippi remained above the dangerous stage of 58 feet for about 15 days during which time about 964,000 acre-feet of water was stored in Norris and Wheeler Reservoirs. This represents an average reduction of about 32,000 cubic feet per second from the flood flow of the Tennessee River. In other words, if the reservoirs had not been in operation at [fol. 4415] the time, the Tennessee River would have contributed an average of 32,000 cubic feet per second more to the flood throughout the 15-day critical period than it actually did contribute.

At no time during the critical period above 58 feet at Cairo did the Tennessee River discharge its full natural flow. In the month of January during the flood period, 1,250,000 acre-feet of water was stored in Norris alone, during which time the reservoir rose more than 40 feet to within about 3 feet of the top of spillway gates.

The net effect of the Tennessee Valley Authority flood-control operations on the Ohio and Mississippi Rivers was a real benefit at a crucial time when each additional inch in flood height was a very serious matter, possibly serious enough to make the difference between holding or losing levees. After the completion of all of the proposed dams

on the main stream and the tributaries of the Tennessee River, the beneficial flood-control effect on the Ohio and Mississippi Rivers will be several times as great.

Preliminary estimates indicate that with the completion of Gilbertsville, Pickwick, Wilson, Wheeler, Guntersville, and Chickamauga Dams on the main stream, and Norris and Hiwassee Dams on tributary streams, the recent flood crest could have been reduced about 2½ feet at Paducah and about 2 feet at Cairo. The addition of Watts Bar and Coulter Shoals Dams on the main stream and Fontana Dam on a tributary stream would add further benefits in the lowering of flood heights at Paducah and Cairo.

APPENDIX "H"

Tennessee Valley Authority annexed budget—Summary

	Actual, prior years	Actual, fiscal year 1936	Estimated, fiscal year 1937	Estimated, fiscal year 1938
Revenue:				
Navigation, flood-control, and hydroelectric program	$2,392,555	$2,027,780	$2,489,131	$4,517,848
National-defense program	86,178	82,980	86,791	85,410
Other undistributed	2,918	3,866	3,500	3,800
Total revenue	2,482,861	2,114,256	2,579,422	4,608,458
Expenditures (obligation basis):				
Navigation, flood-control, and hydroelectric program	46,503,545	50,397,223	45,097,344	48,877,970
Fertilizer and soil-conservation program	2,709,349	3,518,903	3,807,402	3,808,800
National-defense program	1,414,110	890,193	406,565	311,144
Regional studies, experiments, and demonstrations program	402,000	458,899	273,231	257,242
Other undistributed expenditures	935,256	394,125	1,505,582	53,300
Total expenditures	51,994,260	55,898,943	51,270,124	53,106,456
Net appropriation requirements	49,461,679	53,484,687	48,690,702	48,500,000
Means of financing:				
Appropriations, prior years	75,000,000			
Prior year's appropriation available in 1936	−25,518,321	25,518,321		
Tennessee Valley Authority fund of 1936		34,000,000		
Property received from War Department		757,096		
1936 appropriation available in 1937		−8,790,702	8,700,702	
Tennessee Valley Authority fund of 1937			39,900,000	
Contract authorization for 1938				5,500,000
Estimate of appropriation for 1938				43,000,000
Total available funds	49,481,679	53,484,687	48,690,702	48,500,000
Adjustment to cash basis	−1,958,079	−4,653,263	−5,690,702	500,000
Total carried to general budget summary	47,523,600	48,831,424	43,000,000	49,000,000

JUSTIFICATION OF ESTIMATES

The above statement presents the actual and estimated revenues, expenditures, net appropriation requirements, and means of financing of the Tennessee Valley Authority for the fiscal year 1938 and prior periods. The net appropriation requested for the fiscal year 1938 is $43,000,000, or an increase of $3,100,000 over the appropriation for 1937. In addition to the appropriation requested for 1938, a contract authorization of $5,500,000 is requested to provide for equipment that must be ordered in that year. These two amounts make up the total of $48,500,000 that will be required. Comparative statements of revenues and net-appropriation requirements, by programs and projects, follow, in which the estimates for 1938 are justified in detail.

It will be noted that the entire amount of the estimate for 1938 is covered by the appropriation of new funds and the contract authorization. In 1937 nearly a fifth of the total available fund is composed of the reappropriated unobligated balance of the 1936 appropriation. It is estimated that no such balance will be available for 1938.

Receipts, by programs, Tennessee Valley Authority

	Actual, prior years	Actual fiscal year 1936	Estimated, fiscal year 1937	Estimated, fiscal year 1938
Navigation, flood-control, and hydroelectric program:				
Structures and improvements				
Norris project	$788,291	$487,504		
Wheeler project	339,178	312,368		
Pickwick Landing project	31,513	305,121	$356,858	$343,302
Hiwassee project			35,100	215,894
Guntersville project		27,194	222,350	299,429
Chickamauga project		1,876	31,225	56,826
Electrical plant and equipment—repayments	36,117	38,401	78,600	100,000
Subtotal	1,193,087	1,172,864	724,131	974,841

Appendix "H"

[fol. 4418] **Justification of Estimates**

The estimated receipts of the Authority for 1938 are $4,606,456, an increase of $2,027.034 over those estimated for 1937, and an increase of $2,492,200 over those actually received in 1936. The major portion of these receipts is derived from the operating phases of the navigation, flood control, and hydro-electric program. These operations are becoming increasingly important as the demand for electric energy continues to mount, and as some of the new generating plants of the Authority are being brought into operation. This is evidenced by an increase in receipts from electricity operations from $855,096 in 1936 to an estimated total almost double that amount, or $1,377.000 in 1937; and an estimated total almost four times the 1936 amount, or $3,225,000, in 1938. This estimate is explained in detail in a following statement.

Receipts from water-control operations consist principally of income from employee-housing facilities at the Norris and Wheeler projects, which are entering the operating stage. This income approximately offsets the expense of operating the facilities. At Norris, however, an increasing amount of revenue is to be derived from the recreational and other use of the reservoir and the lands around its margin by the public.

Receipts under the structures and improvements section of this program are of two types. The first of these is composed of payments from employees for food, rent, electricity, water, etc., at the construction camps. It is purely incidental to the construction activities. The second consists of repayments from municipalities and cooperative associations which have purchased electrical distribution facilities from the Authority. It will serve, eventually, to liquidate the Authority's investment in such properties. The increase for 1938 over 1937 is accounted for by the larger volume of such transactions outstanding, and by the expected improvement in the operating position of the newer cooperative associations, a number of which are still in the organization stage.

Receipts under the national defense program represent payments for rent, electricity, water, etc., from employees living in the villages on the nitrate-plant reservations at Muscle Shoals. They serve to reduce the cost of maintaining these properties in stand-by condition. Receipts under the other undistributed section of the Budget consist of income from the sale of salvaged materials of a general character, the sale of information bulletins, and sundry other similar sources.

Appendix "H"

[fol. 4419]

Net appropriation requirements—All programs

	Actual, prior years	Actual fiscal year 1936	Estimated, fiscal year 1937	Estimated, fiscal year 1938
I. Navigation, flood-control, and hydroelectric program	$44,109,990	$48,309,463	$42,608,213	$44,360,424
II. Fertilizer and soil-conservation program	2,709,349	3,518,503	3,897,402	3,506,600
III. National defense program	1,328,002	747,263	319,774	225,734
IV. Regional studies, experiments, and demonstrations	402,000	458,899	273,231	357,242
V. Other undistributed expenditures	932,338	390,559	1,592,082	50,000
Total	49,481,679	53,484,687	48,690,702	48,500,000

Appendix "H"

[fol. 4420] Justification of Estimates

The above statement presents in summary form actual and estimated net appropriation requirements for the entire Tennessee Valley Authority program. In this summary and in all of the following statements actual and estimated receipts have been included in order to show the amount of appropriated funds required to finance the various programs and projects.

Since the above estimates for the individual programs are explained in detail in the following text, none of this will be duplicated at this point. It should be noted, however, that the total appropriation requirement for 1938 is $190,702 less than the total for 1937. This decrease is accounted for by substantial reductions in the estimates for the fertilizer and soil conservation, national defense, and other undistributed expenditures programs. These reductions are offset in part by an increase of $1,752,211 for the navigation, flood control, and hydroelectric program and an increase of $84,011 for the regional studies, experiment, and demonstrations program.

The increase for the navigation, flood control, and hydroelectric program is due primarily to the heavy construction schedule involved in completing or continuing work on the six projects now under construction. Included in the estimate for dams under construction is $6,000,000 to provide in part for generator installations in the Guntersville and Chickamauga projects. These installations have been scheduled to meet increased load requirements of the area. Without these installations water power created by the dams will be wasted ans substantially increased revenues will be lost.

APPENDIX "H"

[fol. 4421]

I. Navigation, Flood Control, and Hydroelectric Program

Summary

	Actual, prior years	Actual fiscal year 1936	Estimated, fiscal year 1937	Estimated, fiscal year 1938
A. General investigations projects	$1,345,892	$2,121,075	$1,622,484	$2,515,375
B. Structures and improvements	43,398,924	46,762,374	41,258,090	43,824,747
C. Operations	(634,826)	(513,986)	(272,361)	(1,979,698)
Total	44,109,990	48,369,463	42,608,213	44,360,424

Appendix "H"

[fol. 4422] Justification of Estimates

The statement show- above sets forth in summary form the estimates for the navigation, flood control, and hydroelectric program, which totals, for 1938, $44,360,424 and exceeds by $1,752,208 the estimated expenditures under this program in 1937. This total estimate for 1938 is based on a series of carefully prepared estimates for each project and activity involved in this program. These detailed estimates are set forth on the following pages. Preceding these detailed estimates and immediately following this statement a series of charts and tables is presented to provide in broad outline some of the major phases of the entire program.

The first exhibit is a plan and profile showing the existing and proposed high dams on the Tennessee River. This exhibit, which is entirely self-explanatory, gives a clear picture of the work being done and to be done in providing a 9-foot navigable channel from Knoxville, Tenn., to the mouth of the river, a distance of 652 miles.

The second exhibit is a tabulation giving data on the principal features of present and proposed dam and reservoir projects. The third exhibit is a tabulation showing the status of channel depths at the various sites. This shows the depths prior to Tennessee Valley Authority construction and the resulting depth in each pool following the construction of a given project. The fourth exhibit is a general statement on floods and the flood-control features of the Tennessee Valley Authority program.

The final exhibit is a chart showing system demand, generator installations, and firm power capacity actual and projected to the end of 1940. Since the 1938 estimate includes amounts totalling $6,000,000 for four additional generating units, this exhibit will be explained in detail. This study shows that the great amount of water power provided by the Tennessee Valley Authority dams will be wasted unless electric generating equipment is installed so that it may be sold to the market known to exist.

[fol. 4423] Pages 411-414

The 1938 estimate for general investigation projects of $2,515,375 represents an increase of $892,891 over the 1937 estimate and an increase of $394,300 over the actual expenditures for 1936.

This increase is due principally to the estimate for preliminary project investigations, although small increases are required for general water-control investigations. The estimates for electricity research and development and for general mapping and map records show reductions from the 1937 estimates. This shift in emphasis is occasioned by the necessity for intensive planning both on general investigations and investigations on the main river and tributaries. The flood of January and February of 1937 has demonstrated the need for additional flood-control works in the Mississippi watershed. According to Major General Markham, Chief of Engineers, the flow of the Ohio at that time was 600,000 cubic feet per second greater than any previous estimates. The Tennessee and its tributaries offer opportunities for the construction of storage facilities which will make substantial contributions to the control of the future floods, however great they may be. The investigations provided for in these estimates will more adequately establish the possibilities for economical flood storage, both on the main river and on the tributaries, before construction work proceeds to the point where maximum benefits might be precluded by work already done.

The estimates are explained in detail in the following paragraphs:

1. Water-control Investigations, $408,626.—This estimate provides for the continuation of investigations contributing to the integrated development of the Tennessee River system to achieve the greatest possible navigation and flood-control benefits for both the Tennessee and Mississippi Rivers. This work involves the collection and compilation of hydrographic data and various engineering and economic studies and reports.

The estimate for hydrographic data of $158,079 provides for continuation of an intensive stream-gaging program in cooperation with the United States Geological Survey, Water Resources Branch. There are 174 river gage stations in the Tennessee River basin for which data are compiled by the Tennessee Valley Authority. The United States Geological Survey operates 132 of these stations and the Authority operates the remaining 42. The Authority also compiles data from 344 rainfall stations located in

or near the Tennessee River Basin. The Authority operates and maintains 197 of these stations, the United States Weather Bureau operates 126, and the remaining 21 stations are either operated privately or by other governmental agencies. The Authority operates 46 silt-sampling stations from which data are regularly compiled. Other activities include evaporation measurements, weather forecasting, and preparation of special reports. It should be noted that this [fol. 4424] estimate covers general investigations which cannot be charged directly to preliminary, operating, or construction projects. These data are essential to a full interpretation of the Tennessee watershed as related to flood control on the Tennessee and the Mississippi Rivers.

The 1938 estimates for engineering studies and reports of $179,002 provides for continuation of a general navigation study involving a complete analysis of the navigation program for the purpose of fixing policies and determining facts and presenting same in a complete report: continuation of a study of floods and flood control on the river as a whole to determine methods of control and to secure data as to flood control benefits in the Tennessee and lower Mississippi, with particular attention to the value of flood storage on the lower reaches of the Tennessee with respect to its effect on the Ohio and Mississippi; continuation of power studies to determine plant capacities, sequence of power installations, and methods of operation of the system at various States in its development; and development of a coordinated plan for the construction and operation of the several projects. This estimate includes a special study of the flood-control problem at Chattanooga where local protection works will be required in addition to the protection provided by storage reservoirs. Information as to the amount of local protection that can be economically provided is needed in order to determine the amount of additional storage needed to provide complete flood control protection. Also included is a study of coordinated reservoir operation to most effectively utilize available storage capacity in order to reduce flood flows, maintain flows for navigation, and generate power.

The estimate for economic studies and reports of $71,545 provides for continuation of studies relating to the economics of transportation—rail, water, highway, air, and

pipe line—in the Tennessee Valley area and contiguous territory, involving, specifically, the collection and making available of data relating to transportation in this area, outlets to markets, accessibility to raw materials from a transportation standpoint, the feasibility of water transportation, possible coordination of existing transportation facilities, and the analysis of the freight rate structure from, to, and within the valley area. This estimate also includes other small general studies relating to the navigation and flood control program.

2. Preliminary Project Investigations, $1,572,049.—During 1937, investigations on two remaining dams on the upper Tennessee River which are necessary to provide a 9-foot channel to Knoxville were practically discontinued at the recommendation of the House Appropriations Committee. Estimates are included in the 1938 Budget which provide for the resumption of these preliminary investigations in order to determine the exact location, general design, and probable costs of these structures, so that con- [fol. 4425] struction can be started in the future. Investigations on tributaries were also discontinued in 1937, and their resumption is provided for in the 1938 estimate. It is urgent that these investigations be renewed so that adequate preparation will have been made for future construction.

Gilbertsville Dam and Reservoir, $742,439.—The Gilbertsville Dam will be located 22.5 miles above the mouth of the Tennessee River. The amount requested for 1938 provides for the continuation of studies and investigations preliminary to the beginning of actual construction. This preliminary work will be sufficiently advanced by the end of the fiscal year 1938 so that construction of the project can be commenced early in the fiscal year 1939. During 1938 the principal work to be undertaken is as follows:

(1) Subsurface investigations at both the Gilbertsville and the Birmingham sites, the latter being the only feasible alternate site;

(2) Revisions of estimates and reports required to enable initiation of final designs;

(3) Topographic, dam-site, reservoir land and reservoir utility and cemetery surveys, and area and mosaic mapping;

(4) Preliminary surveys and studies of construction plant, design, hydrographic data, highway and railroad relocation, land acquisition and management, backwater protection, malaria control, reservoir clearing, and general social and economic features of the project.

The reservoir will be 184 miles long, providing navigation to Pickwick Dam. According to present estimates, it will furnish 3,700,000 acre-feet of flood storage. The dam structure will consist of concrete spillway, navigation lock 110 by 600 feet with a maximum lift of probably 68 feet, nonoverflow sections, and intakes for a powerhouse to be constructed as the need for additional generating capacity arises. Earth embankments with a volume of 2,500,000 cubic yards will connect the concrete structure with high ground at each abutment. The over-all length will be approximately 8,300 feet and the maximum height 150 feet.

Watts Bar Dam and Reservoir, $216,628.—The Watts Bar Dam will be located at the head of the Chickamauga Reservoir, approximately 530 miles above the mouth of the Tennessee River. At the beginning of the fiscal year 1937 the investigation of this site had proceeded to the extent of a preliminary drilling program and preliminary estimates of cost. At that time the project had not been studied in sufficient detail to develop substantially a final layout and sufficient drilling had not been done to determine the exact location of the site.

[fol. 4426] Since no funds were included in the 1937 Budget for the further studies which are essential before design and construction of the project can be undertaken, it is highly important that money be included in the 1938 Budget for this purpose. Otherwise, when construction is authorized, there will be considerable loss of time and possibly some sacrifice in economy.

Approximately the entire 1938 fiscal year will be required for these investigations, which are proposed as follows:

(1) Detailed program of core drilling, test pits, and other foundation investigations, to determine the exact location for the axis of the dam.

(2) Detailed studies of backwater effects at various communities above the dam, principally Kingston and Harriman, checking tentative pool levels, and determining backwater damages.

(3) Studies of the layout for structures and development of preliminary design details, so that the plan can be more fully developed and more accurate estimates of construction costs prepared.

(4) Preparation of the final engineering report based on the investigations so as to afford basic information needed by various agencies of the Authority before design, construction, land acquisi-on, and other activities can begin.

(5) Studies concerning the flood control benefits of this project in relation to the other main river and tributary projects.

Coulter Shoals Dam and Reservoir, $230,532.—The Coulter Shoals Dam will be located at the head of Watts Bar Reservoir, approximately 600 miles above the mouth of the Tennessee River. The reservoir will extend to Knoxville. There were no funds in the 1937 Budget for completion of investigations at the Coulter Shoals Dam site, other than a small amount to complete preliminary drilling which had been started in May 1936.

It appears that not less than 1 year will be necessary to complete project investigations before the dam can be definitely located and sufficient information developed so that detailed designs and other activities can proceed.

At the time work was stopped, due to lack of appropriations for this project, the general location of what appears to be a favorable site had been found, but the detailed drilling which will be necessary to explore thoroughly this site may develop conditions which will necessitate further exploration and involve an extended drilling program. The foundation rock for this dam will be Knoxdolomite, which is subject to extensive solution, and in the progress of [fol. 4427] detailed drilling, cavities may be found which would make the site now contemplated unfeasible for construction. This project has not been investigated to the same extent that the Watts Bar project has been investigated, and furthermore, the foundation difficulties will be

much greater, due to entirely different rock formation at the Coulter Shoals site. At least one alternate site should be fully investigated.

The studies which have been made for project layout and the cost estimates on the basis of the best data now available are very preliminary and a great deal of work must be done to develop the basic data for further reports. This work will include the following.

(1) Completion of at least one, if not several, extensive drilling contracts.

(2) Study of backwater damages in the reservoir, particularly at Knoxville, balancing the maximum feasible pool level against extensive potential damages, and investigating methods of protection for minimizing these damages.

(3) Preparation of a preliminary report on engineering investigations to enable studies of land acquisi--on, reservoir clearance, highway and railroad relocation, and similar problems to be investigated, and preparation of a final report to form a basis for the actual work of all activities.

It is extremely important that money be included in the 1938 Budget for the above purposes. Otherwise, when the project is authorized for construction, a year probably will expire before any detailed design or construction could be initiated. It may be anticipated that the foundation conditions at Coulter Shoals will be difficult, and it is both unsafe and uneconomical to initiate a construction program on such a project without knowing to the fullest extent the story on the foundations which are available.

Page 416

Mr. Woodrum: What is the status of that project?

Dr. A. E. Morgan: If I may spend just a moment, I will indicate the necessity of this examination.

At the time the TVA was organized, private interests had settled upon a dam site there. It was called the Shannon site, I believe. It is sometimes called the Aurora site. They are close together and they are confused in the popular mind. That had been settled upon by private industry and by the Government engineers. That, you might say, was the official site of that dam. For a couple of years TVA was under great pressure to recommend the beginning of that

dam and we refused to do so because we felt that the information we had was inadequate and we continued our study of the situation.

It is a difficult site to explore, for the reason that it is in a country that has been raised and lowered within quite recent geologic time. There is about 50 to 100 feet of allu- [fol. 4428] vial soil over the bedrock, and under the soil winding back and forth, there is a river channel 50 to 100 feet deep. You have to explore to find out where that river channel is. Then, it is a region that is faulted and it is a kind of rock that has cavities in it. It is one of the most treacherous places in which to build a dam.

So we refused, against a great deal of pressure locally, to recommend any construction there until we had felt our way. The result is that we have located a site that is entirely superior to the one that was the official site when we came on the job. It is at Gilbertsville, quite a ways below the original site. Not only is it a better site for construction purposes, but it offers a very great possibility for coordinating the control of the Ohio River with that of the Tennessee River.

Page 419

Dr. A. E. Morgan: * * * Take flood control on the Mississippi as a whole. The Federal Government has appropriated money for building, but not enough for finding out what to do; and for 50 years, from the original official report in 1874 until the great flood of 1927, estimates of cost of that work were so inadequate that at no time did they amount to as much as 20 percent of the real cost.

I can quote the estimates by the responsible ranking officials during 50 years on the Mississippi to show you that at all times during that period the official estimates of cost of completing Misissippi flood control were at no time 20 percent of what it is now recognized the actual cost will be.

Mr. Taber: Should they be that much? You say they were never 20 percent of what they cost.

Dr. A. E. Morgan: They were never 20 percent of what the actual total cost is now recognized to be. That is because the Government spent money for building, but did not spend enough money in preliminary investigations to find out what they were doing.

Mr. Taber: You mean the preliminary estimates were never as much as 20 percent of what the total cost was?

Dr. A. E. Morgan: For a period of 50 years, from 1874 to 1927, the official published estimates of cost of Mississippi flood control were never 20 percent of what the actual cost was going to be and is admitted today as necessary.

[fol. 4429] Page 425

Mr. Wigglesworth: What is the ultimate limit of this program you have in mind? How many of these projects are ultimately to be constructed?

Dr. A. E. Morgan: We presented to the Congress a year ago a program for the unified control of the Tennessee River. That includes the construction of the Gilbertsville, Watts Bar, Coulter Shoals, and Fontana Dams, but no others.

Mr. Wigglesworth: Does this picture go beyond that?

Dr. A. E. Morgan: It does not extend beyond those projects. We have no plans beyond that.

But in defining those projects we ought to have a degreee of information that we do not yet possess, for a number of reasons.

For instance, the Mississippi River Committee of the National Resources Board, as well as the Army engineers, have indicated that for complete flood control, or for safe flood control, on the Mississippi River it will be necessary or desirable to get a certain amount of storage on the Tennessee River. That estimate is about 10 million acre-feet of storage on the Tennessee.

The structures we have recommended, and that are included in this plan presented to Congress, will store about 8 million acre-feet, and it will be necessary to have from 2 to 4 million acre-feet additional to meet the demands of the control on the Mississippi River.

Pages 451-2

Mr. Lilienthal: * * * I would like to refresh the committee's recollection, although you are, of course, familiar with the statute under which we operate, by reading if I may section 9 (a) of the act which pretty well defines what our duty is with respect to electricity, both as to its production and to the marketing. That section reads:

The Board is hereby directed in the operation of any dam or reservoir in its possession and control to regulate the stream flow primarily for the purpose of promoting navigation and controlling floods. So far as may be consistent with such purpose the Board is authorized to provide and operate facilities for the generation of electric energy at any such dam for the use of the Corporation and for the use of the United States or any agency thereof; and the Board is further authorized, whenever an opportunity is afforded, to provide and operate facilities for the generation of electric energy in order to avoid the waste of water power, to transmit and market such power as in this Act provided, and thereby, so far as may be practicable, to assist in liquidating the cost or aid in the maintenance of the projects of the Authority.

The statute further lays down in considerable detail the policies that are to guide the Board and by which the Board is bound in this matter of the sale of power thus generated. [fol. 4430] Section 10, for example, lays down a policy of preference to States, counties, municipalities and cooperative organizations of citizens or farmers not organized or doing business for profit, but primarily for the purpose of supplying electricity to its own citizens or members.

Section 11, requires that the power shall be distributed and sold equitably among the States, counties and municipalities within transmission distance; and at another point authorization is given in this marketing program for the construction of transmission lines.

That general background indicates, it seems to me, the responsibility of this phase of the program to produce as much revenue as possible within the limits of market possibility and the transmission area. It indicates the kind of customers who are entitled to purchase; priority to public agencies, but including every other kind of customer, including private utilities and industrials. And those customers are included, we believe, with those priorities among customers to which we will refer in analyzing the revenues.

Preliminary to discussing these particular figures with respect, to transmission lines, for which we are asking $4,700,000 this year, I hope the committee will bear in mind the policies laid down for us and by which we are bound in this act with respect to the marketing of this power;

that we are not free simply to sell it at the busbar at these various dams if requests are made upon us by applicants to whom we must give preference. Further, in the disposition of power generally, transmission lines are obviously necessary, for two reasons: One, the tying together of this series of great dams (the map on p. 30 indicates the progress of that program); and, second, the building of lines for marketing purposes.

These lines may sometimes be lines between dams, which also serve as marketing lines, or they may be primarily marketing lines which also serve a subsidiary purpose in tying of the dams together.

Pages 498-9

Mr. Lilienthal: * * * The need for power in the Tennessee Valley area has been recognized for some years. It has been classified as a deficiency area by the Federal Power Commission in its careful estimate made under the direction of the Congress as to power resources. It has been confirmed by estimates made before this committee.

In 1935, on page 596 of the hearings before this committee, we stated that our figures and the figures of the Federal Power Commission and substantially of the Army Engineers point to the absorption of the existing surplus within 1 or 2 per cent during 1937, which happens to synchronize with the date when the Wheeler and Norris Dams were to provide a total of four additional generators. That is exactly what has happened. The estimates that had been made indicating a vast surplus have been shown to be unnecessarily pessimistic.

[fol. 4431] In 1935, at the time that the Federal Power Commission studies and our own studies were made, the chief engineer of one of the largest utility companies operating in the South, a very able man, presented estimates as to the situation that will exist in 1940; and I should like to point to these as indicating the basis for our own feeling that the estimates that we have been making have been on some realistic basis.

On page 284 of the hearings before the Committee on Military Affairs in March of 1935, Mr. Yates introduced a table in which he estimated that in 1936 there will be a need in his southern companies of 3,763,000,000 kilowatt-

hours; and that 4 years hence, in 1940, there will be a need of 4,575,000,000 kilowatt-hours.

We have the actual figures for 1936, and they show these results: 1936 showed an actual energy required and utilized by those companies of 4,644,000,000 kilowatt-hours, as compared to the estimate of 3,763,000,000 kilowatt-hours. The estimate for 1940 was 4,575,000,000 and the actual for 1936 was in excess of that by 100,000 kilowatt-hours.

The fact is that there is a deficiency in the supply of power in the whole Tennessee Valley area.

Pages 529-530

Mr. Lilienthal: * * * You might be interested in a statement indicating, with respect to particular communities, the efforts which the communities have made to buy, and the result of those efforts. I should think it would be appropriate at this point to have a statement inserted in the record.

Mr. Woodrum: We would like to have that inserted in the record.

Mr. Lilienthal: A large number of cities have demonstrated an interest in obtaining lower electricity rates for their citizens by distributing TVA energy through municipally owned plants. Several hundred cities have applied to TVA for energy; many others have communicated with TVA on the matter. It will be recalled that the statute expressly provides that cities and other nonprofit agencies shall be given preference by TVA in the sale of its surplus power, and confers upon such agencies specific rights flowing out of such preference.

In its relations with these cities, the Authority early laid down two guides from which it has not deviated: (1) Whether or not a city should acquire a system to distribute wholesale energy from the Authority's dam was entirely a local question for the community to decide for itself; (2) once a city had decided to acquire a system for distribution of TVA electricity, the Authority took the position that every possible effort be made by the city to purchase existing facilities rather than construct a new and competing system. This position was reiterated time after time. In some instances the Authority, rather than allow [fol. 4432] negotiations between city and utility to fall

through, sought to carry them on itself after the cities had failed.

By this second guide the Authority sought to preserve the existing systems and protect actual and useful investments of private companies in such properties. At the same time this would permit the citizens to exercise their right under State law to own and operate electrical distribution systems, and their preferential rights conferred by the act of Congress.

Some of the cities had sought to own and operate their distribution systems prior to creation of the Tennessee Valley Authority. In seeking to distribute TVA energy, citizens had expressed themselves at the polls—sometimes by great majorities, as 17½ to 1 in Memphis and 93 to 1 in Lewisburg—or through their duly elected governing bodies to exercise their right to acquire and operate their own electric distribution business.

Pages 537-8

(Here follow two photolithographs, side folios 4433 and 4434)

in proposals for purchase of the existing plant. H. B. Sanders, newspaper proprietor and one of the citizens active in seeking municipal ownership and distribution of T. V. A. energy, reported that the company had obtained an injunction against the city, and "also, they have refused to sell their plant to the city or even discuss naming a price."

In Henderson, Tenn., citizens voted a $35,000 bond issue to build or purchase a distribution system, but the local manager of the West Tennessee Power & Light Co. told city officials that the company was not interested in a sale, that if one were to be considered it would have to be a sale of all the properties owned or controlled by the company.

Table showing towns officially applying for TVA power

State and town	County	Population	How served
Alabama:			
Bessemer	Jefferson	20,721	Birmingham Electric Co.
Boaz	Marshall	1,691	Alabama Power Co.
Cherokee	Colbert	659	Do.
Chairmont Springs	Clay		
Courtland	Lawrence	359	
Elkmont	Limestone	192	
Fayetteville	Morgan	843	Alabama Power Co.
Hartselle	Morgan	2,204	Do.
Huntsville	Madison	11,554	Do.
Jasper	Walker	5,313	Do.
Leighton	Colbert	670	Do.
Madison	Madison	431	
Mooresville	Limestone	114	
Moulton	Lawrence	630	Alabama Power Co.
Red Bay	Franklin	1,707	Do.
Robertsdale	Baldwin	678	Riviera Utilities Corporation.
Rogersville	Lauderdale	445	
Russellville	Franklin	3,146	Alabama Power Co.
Tarrant City	Jefferson	7,341	Birmingham Electric Co.
Town Creek	Lawrence	427	
Vina	Franklin	519	
Valley Head	DeKalb	430	
Arkansas:			
El Dorado	Union	16,421	Arkansas General Utility.
Paragould	Greene	5,996	Arkansas Utilities Co.
West Memphis	Crittenden	895	Arkansas Power & Light.
Georgia:			
Cartersville	Bartow	5,250	Municipal.
Dalton	Whitfield	8,160	Do.
Waycross	Ware	15,510	Georgia Power & Light Co.
Illinois:			
Harrisburg	Saline	11,625	Central Illinois Public Service Co.
Metropolis	Massac	5,373	Municipal.
Kentucky:			
Fulton	Fulton	3,502	Kentucky Utilities Co.
Middlesboro	Bell	10,350	Do.
Trenton	Todd	524	Kentucky-Tennessee Light and Power Co.
Mississippi:			
Aberdeen	LaFayette	3,925	Mississippi Power Co.
Bruce	Calhoun	946	To be served by Pontotoc County Electric Power Association.
Coffeeville	Yalobusha	458	Mississippi Power & Light Co.
Fulton	Itawamba	927	
Greenwood	Leflore	11,123	Municipal.
Hickory Flat	Benton	337	
Oxford (Contract refused by referendum)	Lafayette	2,890	Municipal.
Ripley	Tippah	1,998	Ripley Utilities Co.
Starkville	Oktibbeha	3,612	Mississippi Power Co.
State College	Clay	4,677	
West Point	Haywood	2,414	Municipal.
North Carolina: Waynesville			
Ohio:			
Cincinnati	Hamilton	451,160	Cincinnati Gas & Electric Co.
Portsmouth	Scioto	42,560	Ohio Power Co.

[fol. 4435] APPENDIX "I"

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 365, Being "Hearings Before the Committee on Military Affairs, House of Representatives, 74th Congress, 1st Session, Vol. 1"

Page 24

Mr. Lilienthal: * * * There have been some suggestions from partisan sources that there is now existing an unreasonable surplus power and that we are adding to the surplus. Our computations show that there is a threat of a deficit of power in the Tennessee Valley and in the country as a whole.

Pages 24-25

Mr. Lilienthal: * * * Furthermore, that duty to market power is related to the duty to prevent waste. It is a painful thing to anyone who has a realization of the implications of the situation to see Wilson Dam today. Mr. Chairman, on account of the high water, almost all of the gates of Wilson Dam are open and the water is pouring over the spillway, almost the entire length of the spillway.

Page 26

Mr. Lilienthal: * * * Before the Tennessee Valley Authority as a corporation had been organized, a large number of the communities in that section of Mississippi had written most emphatic messages to the incoming directors insisting that those communities were going to have some of that power. Some of the communities took formal action, others acted through chambers of commerce and school boards and the like.

[fol. 4436] Page 30

The Chairman: This non-profit corporation was organized by the citizens of that section of Mississippi and financed by the Tennessee Valley Authority:

Mr. Lilienthal: Upon their own initiative; yes, sir.

The Chairman: And you deal with them and they are in fact an entirely separate legal entity, with whom you have a contractor's relation?

Mr. Lilienthal: They run their own show.

Appendix "I"

Page 37

Mr. May: What was their original valuation of it, when they first submitted it to you?

Mr. Lilienthal: I do not know. I can submit that figure, but the property was admittedly badly depreciated and allowed to run down, and a great deal of reconstruction has been necessary in order to put it in working condition.

Mr. May: I will be obliged to you if you will give me the figures on what their original proposition was, or what their estimated value of it was.

Mr. Lilienthal: I have it now.

The company put a replacement value new on the inventory of $1,628,495.00. The purchase price was $850,000.00, which is 52 per cent of the replacement value new.

Now, it is a well known fact to people in this field that the electric companies have been paying dividends without building up adequate reserves for depreciation and maintenance, and this company was in that situation. It would have violated our trust as public officers to pay a nickel more for the property than it was worth at the time, despite that error in the past. We paid for the property as it stood.

[fol. 4437]

Page 77

Mr. Lilienthal: * * * As to TVA, we never suggested building competing distribution facilities, and have consistently urged against it by others, in season and out; we have tried hard to prevent a situation where that was the only way out.

Page 78

Mr. Lilienthal: I think that we paid too much for the Mississippi property. I always felt that it was not worth more than 40 per cent of its replacement cost new, because it was so badly run down.

Mr. May: Are you referring to those towns in Northern Mississippi?

Mr. Lilienthal: Yes. We paid 50 per cent of what they thought it would cost to replace it new.

Mr. May: Why were you anxious to pay more than you thought they were worth?

Mr. Lilienthal: Like in every other deal, we believed that it would work out, and we didn't want to see those towns build competing plants. As a matter of fact, it has proven out very satisfactorily by and large.

Page 92

Dr. Morgan: * * * The high dams are of very much greater value to navigation than the low dams are.

One reason is that in passing through a lock, it takes about so long to open the locks, and to close them and it is much [fol. 4438] quicker to pass through 1 high lock than it is through 3 or 4 or 6 or 7 low locks.

Then, between the locks, with the high dams you have deep water and a wide channel, and navigation is far more effective in a broad, open channel than it is in a narrow cut.

You have that situation on the Panama Canal. The difficult navigation on the canal lies in the Culebra Cut, which is narrow and restricted. In the wide open channels vessels can pass and maneuver. Wide channels are much superior.

Another very great advantage of high dams is in relation to the enormous deposits of silt which are coming down from the tributaries. Above the high dams there is space at the bottom of the reservoirs. If a dam is 50 feet high, it would have 20 feet of bottom space for the deposit of silt, and that might be enough to last for a hundred years of deposits or 50 years of deposits, until we can get the silt control under way.

If we should build the low navigation dams, within 10 years we might be putting dredges in to dredge those channels open again.

So, from the standpoint of economy of travel and of locking, from the standpoint of easier manipulation of vessels in a broad, open channel, than in a narrower one, from the standpoint of the prevention of silting, and the elimination of the expense of dredging, the high dams are unquestionably superior to the low dams.

Then again, in those high dams, the water is backed up in some of the tributaries and we get many more miles of navigable channels than we do with a low dam that creates navigable depth just within the main channel.

So, taking the project as a whole, there is no comparison between these high dams and the low dams.

[fol. 4439]

Excerpts Read Into the Record by Defendants from Complainants' Exhibit No. 366, Being "Hearings Before the Committee on Military Affairs, House of Representatives, 74th Congress 1st Session, Vol. 2"

Pages 826-827

Mr. Schaefer: Mr. Lilienthal; I believe the last time you appeared before the Committee you made a statement that at the present time you had surplus power and you were trying to find ways and means of disposing of that power; is that correct?

Mr. Lilienthal: Yes, sir.

Mr. Schaefer: Being one of the directors of this big corporation, under what economic theory do you think it advisable to construct more electric-producing units when you cannot dispose of the power you now have?

Mr. Lilienthal: My conception of the economic theory is this, Mr. Congressman, that there are certain major public purposes that the law provides for; navigation, flood control, soil erosion, and similar purposes. Those are affected by the building of a dam.

Mr. Schaefer: Will you pardon me just a moment? I was not raising that point of going ahead with those projects, at all. My statement was merely in connection with purchasing equipment necessary to produce the power.

Mr. Lilienthal: The installation of the generators?

Mr. Schaefer: Yes. That is what I am referring to.

Mr. Lilienthal: We have made computations which, in graph form and otherwise, have been submitted to the committee for this record, showing the estimates of the need for power in that section. It appears pretty clear—and the figures of the power Commission seem to confirm it—that [fol. 4440] there will be a demand, a need for that power by the time that installation is put in.

At Wheeler Dam we have only one unit put in, although there is room for more.

Appendix "J"

No plans are being made for present installation of power facilities at all at Pickwick Dam. It is purely a navigation dam.

At Norris two units are the full capacity of that storage dam.

As I said, Wheeler has one unit, although more can be put in. Pickwick has none, and Wilson at present has eight.

We have tried to relate what we estimate will be the need for the use of those particular facilities to the facilities that we have. As greater need arises in the future, provision is made for installing additional equipment.

Mr. Schaefer: But your judgment and opinion are based on this report of the Power Commission to a great extent; is that the idea?

Mr. Lilienthal: No; I would not say that. At the time that our plans were made, we made our own investigations. We had made them prior to that time, based pretty largely on a study of the past history of the electrical industry in the United States and the forecast methods that are generally used by utility companies in that respect.

You will recall one of the charts showed the Alabama Power Co., had made a forecast for the following year. While it is based on a technic that I am not entirely fa- [fol. 4441] miliar with, there is a technic that engineers use in forecasting future demand.

That has been employed in trying to see whether or not at the end of the construction period the need will be such as to sustain increased equipment, and then we translate results, or these engineers do, in terms of so many additional generators needed.

[fol. 4442] IN UNITED STATES DISTRICT COURT

STIPULATION AS TO STATEMENT OF EVIDENCE

It is hereby stipulated and agreed between the appellants and appellees, by their solicitors, that the above and foregoing statement of evidence, including the exhibits, is complete, true and correct and may be approved by the Judges.

Baker, Hostetler, Sidlo & Patterson, Trabue, Hume and Armistead, Frantz, McConnell & Seymour, by Charles D. Snepp, Solicitors for Appellants. William C. Fitts, Jr., Solicitors for Appellees.

(Caption omitted)

PRÆCIPE FOR TRANSCRIPT OF RECORD—Filed April 16, 1938

To the Clerk:

The appellants and appellees having through their solicitors agreed as to what shall be included in this præcipe, you will please make a transcript of record to be filed in the United States Supreme Court pursuant to an appeal allowed in the above entitled cause and include in such transcript of record the following pleadings, papers, documents, and exhibits, and no others, to wit:

1. The original Bill of Complaint with all of the exhibits attached thereto.
2. Order of Removal signed by A. E. Mitchell, Chancellor of the Chancery Court of Knox County, Tennessee.
3. Certificate of the Clerk and Master of the Chancery Court of Knox County, Tennessee, to transcript of removal.
4. Certificate of Disqualification of George C. Taylor, District Judge, and designation of Judge John J. Gore.
5. The Amendment to the Bill of Complaint filed August 10, 1936.

[fol. 4445] 6. Defendants' Motion filed August 14, 1936 to Quash Service of Subpœna and Dismiss Bill of Complaint for Lack of Jurisdiction.

7. Memorandum opinion filed October 17, 1936, overruling Defendants' Motion to Quash Service of Subpœna and Dismiss the Bill of Complaint for Lack of Jurisdiction.
8. Decree, filed October 19, 1936, overruling Motion to Quash Service of Subpœna and Dismiss Bill of Complaint.
9. Defendants' Motion filed October 20, 1936, to Dismiss Bill of Complaint.
10. Memorandum opinion filed November 9, 1936, overruling Defendants' Motion to Dismiss.
11. Decree, filed November 12, 1936, overruling Motion to Dismiss.
12. Answer to the Bill of Complaint filed by the Defendants on November 24, 1936, omitting, however, all exhibits attached thereto except Exhibits "A" and "K" and insert-

ing at the place where Exhibits "A" and "K" would be otherwise inserted the following statements:

Exhibit "A" attached to Answer to the original Bill of Complaint is the same as Complainants' Exhibit No. 328, being a copy of the Report to Congress by TVA on the Unified Development of the Tennessee River System, dated March 1936, and is here omitted since Complainants' Exhibit No. 328 is transmitted as an original exhibit.

Exhibit "K" attached to the Answer to the original Bill of Complaint is a copy of the printed record in the case of Tennessee Valley Authority, et al., v. Ashwander, et al., and is transmitted as an original exhibit.

13. Memorandum opinion filed December 22, 1936, granting the preliminary injunction.

14. Order filed January 19, 1937, fixing time for taking depositions.

15. Order filed March 19, 1937, fixing time for taking depositions.

16. Defendants' Motion filed June 14, 1937, to strike portions of the Bill of Complaint.

17. Defendants' Motion filed June 14, 1937, for Bill of Particulars.

18. Opinion of the United States Circuit Court of Appeals [fol. 4446] for the Sixth Circuit in the case of Tennessee Valley Authority, et al., Appellants, v. The Tennessee Electric Power Company, et al., Appellees, decided May 14, 1937, and filed on June 15, 1937. (The opinion is here omitted as a copy of it is attached as "Appendix C" to the "Separate Statement As To Jurisdiction", which is Item No. 56 herein.)

19. Order, filed June 16, 1937, Dissolving Preliminary Injunction.

20. Order, filed July 3, 1937, on Defendants' Motion to Strike portions of the Bill of Complaint.

21. Order, filed July 3, 1937, appointing Hal H. Clements, Jr., Special Master.

22. Order filed July 8, 1937, on Defendants' Motion for Bill of Particulars.

23. Bill of Particulars filed August 6, 1937.

24. Stipulation filed August 14, 1937, and Amendment thereto filed September 2, 1937.

25. Suggestion filed August 28, 1937, that Act of Congress of August 24, 1937, requires application to Senior or Presiding Circuit Judge for designation of two additional judges to hear cause, omitting the draft of the request for designation of additional judges.

26. Motion filed September 20, 1937, to compel Defendants to produce documents and permit inspection thereof, together with the exhibits attached thereto.

27. Motion filed September 20, 1937, for leave to take the deposition of Harold L. Ickes, omitting however, Exhibit "A" thereto attached and inserting in the place where such exhibit would be otherwise inserted the following statement:

Exhibit "A" attached to the motion for leave to take the deposition of Harold L. Ickes is a copy of the order appointing Hal H. Clements, Jr., as Special Master, and to avoid duplication is here omitted.

28. Application of Complainants filed September 20, 1937, for an order requiring Defendants to produce documents, or, in the alternative, for extension of time for taking testimony before Special Master.

29. Orders filed September 21, 1937, designating judges to try case.

29½. Affidavit of James Lawrence Fly filed September 27, 1937.

30. Order filed September 29, 1937, permitting Complainants to amend the motion to compel Defendants to produce certain documents and permit inspection thereof.

[fol. 4447] 31. Order filed September 29, 1937, permitting Complainants to amend the motion to take the deposition of Harold L. Ickes, together with Exhibit "C" attached thereto.

32. Memorandum decision filed September 29, 1937, overruling Complainants' motion for leave to take the deposition of Harold L. Ickes, overruling Complainants' Motion for an order requiring Defendants to produce documents, or, in the alternative, for an extension of time for taking testimony before the Special Master and overruling Complainants' motion to compel Defendants to produce documents and permit inspection thereof.

33. Order filed September 29, 1937, overruling and denying Complainants' motion for leave to take the deposition of Harold L. Ickes.

34. Order filed September 29, 1937, overruling and denying Complainants' motion to compel Defendants' to produce documents and permit inspection thereof.

35. Order filed September 29, 1937, overruling and denying application of Complainants for an order requiring Defendants to produce documents, or, in the alternative, for extension of time for taking testimony before the Special Master.

36. Supplement filed October 21, 1937, to Bill of Particulars.

37. Memorandum opinion filed November 1, 1937, on Complainants' motion to require Defendants to produce documents and permit the inspection thereof, Complainants' motion for an order requiring Defendants to produce documents, or, in the alternative, for an extension of time for taking testimony before Special Master, and Complainants' motion for leave to take the deposition of Harold L. Ickes.

38. Petition filed November 12, 1937, for rehearing motion to take the deposition of Harold L. Ickes.

39. Motion filed December 6, 1937, for leave to take deposition of Harold L. Ickes, together with the affidavit attached thereto.

40. Motion filed January 18, 1938, on behalf of the Complainants to strike and disregard briefs filed by the Defendants on January 17, 1938, together with the affidavit attached thereto.

41. Complainants' suggested Findings of Fact, filed January 19, 1938.

42. Defendants' suggested Findings of Fact and Conclusions of Law, filed January 19, 1938.

[fol. 4448] 43. Opinion of the Court, dated January 21, 1938, and filed January 24, 1938.

44. Order filed January 24, 1938, overruling Complainants' motion to strike and disregard briefs filed by Defendants on January 17, 1938.

45. Order filed January 24, 1938, regarding Findings of Fact and Conclusions of Law requested by the Complainants and Defendants.

46. Final decree, filed January 25, 1938.

47. Motion filed February 7, 1938, to dismiss suit as against Georgia Power Company without prejudice.

48. Georgia Power Company's petition for rehearing filed February 7, 1938, together with all exhibits attached thereto; omitting, however, Exhibit 2 except as noted below and in-

serting in the place where said exhibit would be otherwise inserted the following statement:

Exhibit 2 is a copy of the motion referred to herein as being filed February 7, 1938.

49. Motion filed February 8, 1938, by Defendants for Findings of Fact and Conclusions of Law, omitting, however, the attached draft of Findings of Fact and Conclusions of Law and inserting in the place where same would otherwise be inserted the following statement:

The draft of Findings of Fact and Conclusions of Law attached to the motion is the same as the Findings of Fact and Conclusions of Law filed by the court on February 23, 1938, and is here omitted.

50. Order filed February 22, 1938, dismissing the Georgia Power Company without prejudice.

51. Order filed February 23, 1938, on Findings of Fact and Conclusions of Law.

52. Findings of Fact and Conclusions of Law, filed February 23, 1938.

53. Notice of Appeal served on Appellees on February 23, 1938, and filed on the same date.

54. Petition for Appeal filed February 24, 1938.

55. Assignment of Errors filed February 24, 1938.

56. Separate Statement as to Jurisdiction together with the appendices, filed February 24, 1938.

57. Order filed February 24, 1938, allowing appeal.

58. Appeal bond, filed February 24, 1938.

[fol. 4449] 59. Citation, including acceptance of service by Appellees on February 24, 1938, and filed on the same date.

60. Acknowledgment of service by Appellees of copies of the Petition for Appeal, Order Allowing Appeal, Assignments of Error, Statement as to Jurisdiction and Notice of Rule 12, Paragraph 3, of the Rules of the Supreme Court, filed February 24, 1938.

61. Complainants' exception filed March 3, 1938, to the Order of February 23, 1938. (Item No. 51 herein.)

62. Order of the Court for transmission of original exhibits filed April 4, 1938.

63. Notice of the lodging of the Statement of Evidence and exhibits, and the acknowledgment of service thereof, filed April 7, 1938.

64. Order, filed April 16, 1938, approving Statement of Evidence.

65. Statement of the evidence under Equity Rule 75, including the exhibits, all of which the court approved.

66. Original exhibits to be transmitted to the Supreme Court as enumerated in the Court's order of April 4, 1938, referred to herein as item No. 62.

67. This Praecipe.

68. Certificate of the Clerk.

Said transcript to be prepared as required by law and the rules of this Court and the rules of the Supreme Court of the United States and to be filed in the office of the Clerk of the Supreme Court of the United States on or before the 25th day of April, 1938.

Baker, Hostetler, Sidlo & Patterson, Trabue, Hume & Armistead, Frantz, McConnell & Seymour, by Charles D. Snepp, Solicitors for Appellants. Wm. C. Fitts, Jr., Solicitor for Appellees.

[fol. 4450] Clerk's certificate to foregoing transcript omitted in printing.

[fol. 4451] IN SUPREME COURT OF THE UNITED STATES

STATEMENT OF POINTS TO BE RELIED UPON—Filed April 18, 1938

Come now The Tennessee Electric Power Company, Franklin Power & Light Company, Memphis Power & Light Company, Southern Tennessee Power Company, Birmingham Electric Company, Missippi Power Company, Appalachian Electric Power Company, Carolina Power & Light Company, Tennessee Public Service Company, Holston River Electric Company, Alabama Power Company, Kentucky & West Virginia Power Company, Inc., Kingsport Utilities, Incorporated, Kentucky-Tennessee Light & Power Co., West Tennessee Power & Light Company, Mississippi Power & Light Company, East Tennessee Light & Power Company and Tennessee Eastern Electric Company, appellants in the above entitled cause and adopt their Assignments of Error as their State-
[fol. 4452] ment of Points to be Relied Upon.

R. T. Jackson. Charles C. Trabue. Charles M. Seymour.

Dated April 18, 1938.

[fol. 4453] [File endorsement omitted.]

[fol. 4454] IN SUPREME COURT OF THE UNITED STATES

STIPULATION AS TO PRINTING OF RECORD—Filed April 18, 1938

It is hereby stipulated between the appellants and appellees, by their attorneys, that in printing the Record in the above entitled cause the Clerk shall only omit therefrom the following maps, drawings, documents and papers:

Complainants' Exhibit Nos. 7, 12, 27, 29, 33, 37, 41, 45, 49, 54, 74, 82, 89, 98, 101, 105, 105c, 105d, 106, 107, 108, 109, 112-116, inclusive, 182, 183, 184, 187, 199, 205-210, inclusive, 266, 320, 321, 326-330 inclusive, 332, 332a, 333a, 334, 335a, 336, 338, 342-346 inclusive, 350, 351, 352, 354, 357, 358, 359, 361, 362, 364, 365, 366, 372, 409-411 inclusive, 485, 487-496 inclusive, 503, 646, 907, 909, 912-915 inclusive, 925, [fols. 4455-4456] 933, 936 and 942.

Defendants' Exhibit Nos. 31, 32, 36, 37, 38, 40, 44, 49, 50, 55-64 inclusive, 66, 72, 73, 81, 83, 86, 87, 89-93 inclusive, 95, 96, 97, 98, 104, 109, 110, 116, 118-125 inclusive, 130, 132, 136a, 136b, 137, 138, 153, 154, and Exhibit "K" to Defendants' Answer.

It is further stipulated that the maps, charts, documents, papers, etc., above mentioned which are to be omitted from the printed Record shall be preserved by the Court and may be referred to by counsel, or the Court, if deemed necessary during the course of the argument or otherwise in the disposition of the cause.

SUPREME COURT OF THE UNITED STATES

OCTOBER TERM, 1937

No. 975

THE TENNESSEE ELECTRIC POWER COMPANY, A MARYLAND CORPORATION, ET AL.,

Appellants,

vs.

TENNESSEE VALLEY AUTHORITY, A BODY CORPORATE CREATED BY AN ACT OF CONGRESS APPROVED MAY 18, 1933; ARTHUR E. MORGAN, HARCOURT A. MORGAN, AND DAVID E. LILIENTHAL, EACH INDIVIDUALLY AND AS AN EXECUTIVE OFFICER AND DIRECTOR OF THE TENNESSEE VALLEY AUTHORITY,

Appellees.

SEPARATE STATEMENT AS TO JURISDICTION.

In compliance with Rule 12 of the Revised Rules of the Supreme Court of the United States, appellants here submit their separate typewritten statement disclosing the basis upon which it is contended that the Supreme Court of the United States has jurisdiction upon appeal to review the decree of the United States District Court for the Eastern District of Tennessee, Northern Division, in the above entitled cause.

I.

The instant suit was originally filed in the Chancery Court at Knoxville, Tennessee, and was removed by the defendants therein to the United States District Court for the Eastern District of Tennessee, Northern Division. The complainants are eighteen corporations each of which was and is engaged in the generation, transmission or sale of electric energy as a public utility and operating in one or more of the States of Tennessee, Georgia, Alabama, Mississippi, Kentucky, North Carolina or Virginia, and entirely or partly in an area within which electrical energy might be practically transmitted from one or more of the dams now constructed, under construction or proposed to be constructed on the Tennessee River or its tributaries by Tennessee Valley Authority.

The defendants are Tennessee Valley Authority, a corporation created by Act of the Congress of the United States, and the three individuals who have comprised at all times since its organization and now do comprise the Board of Directors of said Authority, each of whom is named as defendant as an individual and as a director of said Authority.

Complainants, in said bill, seek an order or decree enjoining the further execution of the Tennessee Valley Authority Act of May 18, 1933, as amended August 31, 1935, and enjoining acts being performed and threatened to be performed by said Authority and the individual directors thereof in the execution of said statute upon the ground that neither said statute nor any of the acts being done or threatened to be done by the Authority and the individual Directors is authorized by any provision of the Constitution of the United States and they are severally in violation of Article I, Section 1, Article II, Sections 1 and 8, and in violation of the Fifth, Ninth and Tenth Amendments thereof, (a)

in that the said statute attempts to authorize and the defendants are engaged in constructing and threatening to complete the construction of a large system of dams and reservoirs for the purpose of generating hydro-electric power on the Tennessee River and its tributaries; (b) in that the said statute purports to authorize and the defendants are engaged in constructing heavy duty transmission lines to interconnect such hydro-electric generating plants so as to create a power pool from which, at any point, electric power can be drawn without reference to the point of generation and so as to create an integrated power generating system; (c) in that the said statute purports to authorize and the defendants are engaged in constructing and threatening to carry to completion a duplicating system of high tension transmission lines, substations, distribution lines and other facilities for the transmission, distribution and sale of electricity as a public utility throughout the State of Tennessee and large parts of the States of Alabama, Georgia, Mississippi, Kentucky, North Carolina, Virginia and West Virginia, in which complainants are now and have been operating as electric utilities, pursuant to the laws and the regulations of Public Authorities of the respective States in which each of complainants' properties and businesses are located; (d) in that the statute purports to authorize and the Authority and the defendant directors are engaged in creating and threatening to complete a huge Federally-owned and operated electric utility, which will compete with, if it will not destroy, each of the complainants in their respective service areas in the states aforesaid; (e) in that the statute purports to authorize and the said Authority and individual directors are engaged in the promotion of ownership and operation of local electric intrastate utilities by municipalities and non-profit organizations as agents of the Tennessee Valley Authority to distribute

power sold by it; (f) in that the statute purports to authorize and the Tennessee Valley Authority and individual directors are engaged in effecting a Federal regulation of the local electric rates of said municipalities, non-profit organizations and existing electric utilities, including the complainants, in the area in which said Authority and said directors are operating and threatening to operate said Federally-owned electric utility; and (g) in that the defendants, as a means of furthering the aforesaid objects and of taking over the operation and control of the electric power business in the territory now served by the several complainant companies, have promulgated and prescribed electric rates which are non-compensatory, confiscatory and discriminatory, have acted in concert with PWA, REA and other Federal agencies in assisting and inciting municipalities and non-profit organizations, through loans and gifts of Federal funds and by a campaign of propaganda against privately owned utilities to acquire local distribution systems to distribute TVA power, and have aggressively advertised and promoted the sale of TVA power among the customers of the complainant companies; and that the present and threatened future execution of said statute by said Authority and the present and threatened acts of said individual directors threaten irreparable injury, if not destruction, of the properties and businesses of each of the complainants, are unauthorized by any provision of the Constitution of the United States, invade the powers reserved to the States and the people and have and will further deprive each of complainants of their property without due process of law, all in violation of the Constitution of the United States, as aforesaid.

Pursuant to an act of the Congress of the United States, passed August 24, 1937, to wit, 28 U. S. C. § 380a, the presiding judge of the United States Circuit Court of Appeals for

the Sixth Circuit designated the Honorable Florence E. Allen, United States Circuit Judge, the Honorable John J. Gore, United States District Judge and the Honorable John D. Martin, United States District Judge to hear and determine said cause, and said United States District Court, so constituted as a statutory or three judge court heard the evidence and arguments and entered its decree denying the prayers of the complainants' Bill of Complaint and dismissing the same at complainants' cost.

II.

By express provisions of said Section 380a of Title 28, United States Code, jurisdiction is conferred upon this Court to review, by direct appeal, the judgments, including the judgment in the instant case of such specially constituted district court.

III.

The statute of the Congress of the United States, the validity of which is involved, is the Tennessee Valley Authority Act approved May 18, 1933 (48 Statutes 58-72), as amended August 31, 1935 (49 Statutes 1075-1081), and is hereto appended verbatim as appendix A.

IV.

The judgment complained of and sought to be reviewed was entered January 25, 1938, and a petition for the allowance of an appeal therefrom was presented February 24, 1938.

V.

The opinion of the specially constituted United States District Court, filed January 21, 1938, is hereto attached, marked "Appendix B" and the opinion of the United States Circuit Court of Appeals for the Sixth Circuit denying com-

plainants an interlocutory injunction in said cause filed the 14th day of May, 1937, is hereto attached and marked "Appendix C."

Respectfully submitted,

Of Counsel for Petitioners.

Dated February 24, 1938.

APPENDIX "A".

[PUBLIC—No. 17—73D CONGRESS.]

[H. R. 5081.]

AN ACT.

To improve the navigability and to provide for the flood control of the Tennessee River; to provide for reforestation and the proper use of marginal lands in the Tennessee Valley; to provide for the agricultural and industrial development of said valley; to provide for the national defense by the creation of a corporation for the operation of Government properties at and near Muscle Shoals in the State of Alabama, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That for the purpose of maintaining and operating the properties now owned by the United States in the vicinity of Muscle Shoals, Alabama, in the interest of the national defense and for agricultural and industrial development, and to improve navigation in the Tennessee River and to control the destructive flood waters in the Tennessee River and Mississippi River Basins, there is hereby created a body corporate by the name of the "Tennessee Valley Authority" (hereinafter referred to as the "Corporation"). The board of directors first appointed shall be deemed the incorporators, and the incorporation shall be held to have been effected from the date of the first meeting of the board. This Act may be cited as the "Tennessee Valley Authority Act of 1933."

SEC. 2. (a) The board of directors of the Corporation (hereinafter referred to as the "board") shall be composed of three members, to be appointed by the President, by and with the advice and consent of the Senate. In appointing the members of the board, the President shall designate the chairman. All other officials, agents, and employees shall be designated and selected by the board.

(b) The terms of office of the members first taking office after the approval of this Act shall expire as designated by the President at the time of nomination, one at the end of the third year, one at the end of the sixth year and one at the end of the ninth year, after the date of approval of this Act. A successor to a member of the board shall be appointed in the same manner as the original members and shall have a term of office expiring nine years from the date of the expiration of the term for which his predecessor was appointed.

(c) Any member appointed to fill a vacancy in the board occurring prior to the expiration of the term for which his predecessor was appointed shall be appointed for the remainder of such term.

(d) Vacancies in the board so long as there shall be two members in office shall not impair the powers of the board to execute the functions of the Corporation, and two of the members in office shall constitute a quorum for the transaction of the business of the board.

(e) Each of the members of the board shall be a citizen of the United States, and shall receive a salary at the rate of $10,000 a year, to be paid by the Corporation as current expenses. Each member of the board, in addition to his salary, shall be permitted to occupy as his residence one of the dwelling houses owned by the Government in the vicinity of Muscle Shoals, Alabama, the same to be designated by the President of the United States. Members of the board shall be reimbursed by the Corporation for actual expenses (including traveling and subsistence expenses) incurred by them in the performance of the duties vested in the board by this Act. No member of said board shall, during his continuance in office, be engaged in any other business, but each member shall devote himself to the work of the Corporation.

(f) No director shall have financial interest in any public-utility corporation engaged in the business of distributing and selling power to the public nor in any corporation engaged in the manufacture, selling, or distribution of fixed nitrogen or fertilizer, or any ingredients thereof, nor shall

any member have any interest in any business that may be adversely affected by the success of the Corporation as a producer of concentrated fertilizers or as a producer of electric power.

(g) The board shall direct the exercise of all the powers of the Corporation.

(h) All members of the board shall be persons who profess a belief in the feasibility and wisdom of this Act.

SEC. 3. The board shall without regard to the provisions of Civil Service laws applicable to officers and employees of the United States, appoint such managers, assistant managers, officers, employees, attorneys, and agents, as are necessary for the transaction of its business, fix their compensation, define their duties, require bonds of such of them as the board may designate, and provide a system of organization to fix responsibility and promote efficiency. Any appointee of the board may be removed in the discretion of the board. No regular officer or employee of the Corporation shall receive a salary in excess of that received by the members of the board.

All contracts to which the Corporation is a party and which require the employment of laborers and mechanics in the construction, alteration, maintenance, or repair of buildings, dams, locks, or other projects shall contain a provision that not less than the prevailing rate of wages for work of a similar nature prevailing in the vicinity shall be paid to such laborers or mechanics.

In the event any dispute arises as to what are the prevailing rates of wages, the question shall be referred to the Secretary of Labor for determination, and his decision shall be final. In the determination of such prevailing rate or rates, due regard shall be given to those rates which have been secured through collective agreement by representatives of employers and employees.

Where such work as is described in the two preceding paragraphs is done directly by the Corporation the prevailing rate of wages shall be paid in the same manner as though such work had been let by contract.

Insofar as applicable, the benefits of the Act entitled "An Act to provide compensation for employees of the United States suffering injuries while in the performance of their duties, and for other purposes," approved September 7, 1916, as amended, shall extend to persons given employment under the provisions of this Act.

SEC. 4. Except as otherwise specifically provided in this Act, the Corporation—

(a) Shall have succession in its corporate name.

(b) May sue and be sued in its corporate name.

(c) May adopt and use a corporate seal, which shall be judicially noticed.

(d) May make contracts, as herein authorized.

(e) May adopt, amend, and repeal bylaws.

(f) May purchase or lease and hold such real and personal property as it deems necessary or convenient in the transaction of its business, and may dispose of any such personal property held by it.

The board shall select a treasurer and as many assistant treasurers as it deems proper, which treasurer and assistant treasurers shall give such bonds for the safe-keeping of the securities and moneys of the said Corporation as the board may require: *Provided*, That any member of said board may be removed from office at any time by a concurrent resolution of the Senate and the House of Representatives.

(g) Shall have such powers as may be necessary or appropriate for the exercise of the powers herein specifically conferred upon the Corporation.

(h) Shall have power in the name of the United States of America to exercise the right of eminent domain, and in the purchase of any real estate or the acquisition of real estate by condemnation proceedings, the title to such real estate shall be taken in the name of the United States of America, and thereupon all such real estate shall be en-

trusted to the Corporation as the agent of the United States to accomplish the purposes of this Act.

(i) Shall have power to acquire real estate for the construction of dams, reservoirs, transmission lines, power houses, and other structures, and navigation projects at any point along the Tennessee River, or any of its tributaries, and in the event that the owner or owners of such property shall fail and refuse to sell to the Corporation at a price deemed fair and reasonable by the board, then the Corporation may proceed to exercise the right of eminent domain, and to condemn all property that it deems necessary for carrying out the purposes of this Act, and all such condemnation proceedings shall be had pursuant to the provisions and requirements hereinafter specified, with reference to any and all condemnation proceedings.

(j) Shall have power to construct dams, reservoirs, power houses, power structures, transmission lines, navigation projects, and incidental works in the Tennessee River and its tributaries, and to unite the various power installations into one or more systems by transmission lines.

SEC. 5. The board is hereby authorized—

(a) To contract with commercial producers for the production of such fertilizers or fertilizer materials as may be needed in the Government's program of development and introduction in excess of that produced by Government plants. Such contracts may provide either for outright purchase of materials by the board or only for the payment of carrying charges on special materials manufactured at the board's request for its program.

(b) To arrange with farmers and farm organizations for large-scale practical use of the new forms of fertilizers under conditions permitting an accurate measure of the economic return they produce.

(c) To cooperate with National, State, district, or county experimental stations or demonstration farms, for the use of new forms of fertilizer or fertilizer practices during the initial or experimental period of their introduction.

(d) The board in order to improve and cheapen the production of fertilizer is authorized to manufacture and sell fixed nitrogen, fertilizer, and fertilizer ingredients at Muscle Shoals by the employment of existing facilities, by modernizing existing plants, or by any other process or processes that in its judgment shall appear wise and profitable for the fixation of atmospheric nitrogen or the cheapening of the production of fertilizer.

(e) Under the authority of this Act the board may make donations or sales of the product of the plant or plants operated by it to be fairly and equitably distributed through the agency of county demonstration agents, agricultural colleges, or otherwise as the board may direct, for experimentation, education, and introduction of the use of such products in cooperation with practical farmers so as to obtain information as to the value, effect, and best methods of their use.

(f) The board is authorized to make alterations, modifications, or improvements in existing plants and facilities, and to construct new plants.

(g) In the event it is not used for the fixation of nitrogen for agricultural purposes or leased, then the board shall maintain in stand-by condition nitrate plant numbered 2, or its equivalent, for the fixation of atmospheric nitrogen, for the production of explosives in the event of war or a national emergency, until the Congress shall by joint resolution release the board from this obligation, and if any part thereof be used by the board for the manufacture of phosphoric acid or potash, the balance of nitrate plant numbered 2 shall be kept in stand-by condition.

(h) To establish, maintain, and operate laboratories and experimental plants, and to undertake experiments for the purpose of enabling the Corporation to furnish nitrogen products for military purposes, and nitrogen and other fertilizer products for agricultural purposes in the most economical manner and at the highest standard of efficiency.

(i) To request the assistance and advice of any officer, agent, or employee of any executive department or of any

independent office of the United States, to enable the Corporation the better to carry out its powers successfully, and as far as practicable shall utilize the service of such officers, agents, and employees, and the President shall, if in his opinion, the public interest, service, or economy so require, direct that such assistance, advice, and service be rendered to the Corporation, and any individual that may be by the President directed to render such assistance, advice, and service shall be thereafter subject to the orders, rules, and regulations of the board: *Provided*, That any invention or discovery made by virtue of and incidental to such service by an employee of the Government of the United States serving under this section, or by any employee of the Corporation, together with any patents which may be granted thereon, shall be the sole and exclusive property of the Corporation, which is hereby authorized to grant such licenses thereunder as shall be authorized by the board: *Provided further*, That the board may pay to such inventor such sum from the income from sale of licenses as it may deem proper.

(j) Upon the requisition of the Secretary of War or the Secretary of the Navy to manufacture for and sell at cost to the United States explosives or their nitrogenous content.

(k) Upon the requisition of the Secretary of War the Corporation shall allot and deliver without charge to the War Department so much power as shall be necessary in the judgment of said Department for use in operation of all locks, lifts, or other facilities in aid of navigation.

(l) To produce, distribute, and sell electric power, as herein particularly specified.

(m) No products of the Corporation shall be sold for use outside of the United States, its Territories and possessions, except to the United States Government for the use of its Army and Navy, or to its allies in case of war.

(n) The President is authorized, within twelve months after the passage of this Act, to lease to any responsible farm organization or to any corporation organized by it

nitrate plant numbered 2 and Waco Quarry, together with the railroad connecting said quarry with nitrate plant numbered 2, for a term not exceeding fifty years at a rental of not less than $1 per year, but such authority shall be subject to the express condition that the lessee shall use said property during the term of said lease exclusively for the manufacture of fertilizer and fertilizer ingredients to be used only in the manufacture of fertilizer by said lessee and sold for use as fertilizer. The said lessee shall covenant to keep said property in first-class condition, but the lessee shall be authorized to modernize said plant numbered 2 by the installation of such machinery as may be necessary, and is authorized to amortize the cost of said machinery and improvements over the term of said lease or any part thereof. Said lease shall also provide that the board shall sell to the lessee power for the operation of said plant at the same schedule of prices that it charges all other customers for power of the same class and quantity. Said lease shall also provide that, if the said lessee does not desire to buy power of the publicly owned plant, it shall have the right to purchase its power for the operation of said plant of the Alabama Power Company or any other publicly or privately owned corporation engaged in the generation and sale of electric power, and in such case the lease shall provide further that the said lessee shall have a free right of way to build a transmission line over Government property to said plant paying the actual expenses and damages, if any, incurred by the Corporation on account of such line. Said lease shall also provide that the said lessee shall covenant that during the term of said lease the said lessee shall not enter into any illegal monopoly, combination, or trust with any privately owned corporation engaged in the manufacture, production, and sale of fertilizer with the object or effect of increasing the price of fertilizer to the farmer.

SEC. 6. In the appointment of officials and the selection of employees for said Corporation, and in the promotion of any such employees or officials, no political test or qualification shall be permitted or given consideration, but all such appointments and promotions shall be given and made

on the basis of merit and efficiency. Any member of said board who is found by the President of the United States to be guilty of a violation of this section shall be removed from office by the President of the United States, and any appointee of said board who is found by the board to be guilty of a violation of this section shall be removed from office by said board.

SEC. 7. In order to enable the Corporation to exercise the powers and duties vested in it by this Act—

(a) The exclusive use, possession, and control of the United States nitrate plants numbered 1 and 2, including steam plants, located, respectively, at Sheffield, Alabama, and Muscle Shoals, Alabama, together with all real estate and buildings connected therewith, all tools and machinery, equipment, accessories, and materials belonging thereto, and all laboratories and plants used as auxiliaries thereto; the fixed-nitrogen research laboratory, the Waco limestone quarry, in Alabama, and Dam Numbered 2, located at Muscle Shoals, its power house, and all hydroelectric and operating appurtenances (except the locks), and all machinery, lands, and buildings in connection therewith, and all appurtenances thereof, and all other property to be acquired by the Corporation in its own name or in the name of the United States of America, are hereby intrusted to the Corporation for the purposes of this Act.

(b) The President of the United States is authorized to provide for the transfer to the Corporation of the use, possession, and control of such other real or personal property of the United States as he may from time to time deem necessary and proper for the purposes of the Corporation as herein stated.

SEC. 8. (a) The Corporation shall maintain its principal office in the immediate vicinity of Muscle Shoals, Alabama. The Corporation shall be held to be an inhabitant and resident of the northern judicial district of Alabama within the meaning of the laws of the United States relating to the venue of civil suits.

(b) The Corporation shall at all times maintain complete and accurate books of accounts.

(c) Each member of the board, before entering upon the duties of his office, shall subscribe to an oath (or affirmation) to support the Constitution of the United States and to faithfully and impartially perform the duties imposed upon him by this Act.

SEC. 9. (a) The board shall file with the President and with the Congress, in December of each year, a financial statement and a complete report as to the business of the Corporation covering the preceding governmental fiscal year. This report shall include an itemized statement of the cost of power at each power station, the total number of employees and the names, salaries, and duties of those receiving compensation at the rate of more than $1,500 a year.

(b) The Comptroller General of the United States shall audit the transaction of the Corporation at such times as he shall determine, but not less frequently than once each governmental fiscal year, with personnel of his selection. In such connection he and his representatives shall have free and open access to all papers, books, records, files, accounts, plants, warehouses, offices, and all other things, property and places belonging to or under the control of or used or employed by the Corporation, and shall be afforded full facilities for counting all cash and verifying transactions with and balances in depositaries. He shall make report of each such audit in quadruplicate, one copy for the President of the United States, one for the chairman of the board, one for public inspection at the principal office of the corporation, and the other to be retained by him for the uses of the Congress. The expenses for each such audit may be paid from moneys advanced therefor by the Corporation, or from any appropriation or appropriations for the General Accounting Office, and appropriations so used shall be reimbursed promptly by the Corporation as billed by the Comptroller General. All such audit expenses shall be charged to operating expenses of the Corporation. The Comptroller General shall make special report to the President of the United States and to the Congress of any transaction or condition found by him to be in conflict with the powers or duties intrusted to the Corporation by law.

SEC. 10. The board is hereby empowered and authorized to sell the surplus power not used in its operations, and for operation of locks and other works generated by it, to States, counties, municipalities, corporations, partnerships, or individuals, according to the policies hereinafter set forth; and to carry out said authority, the board is authorized to enter into contracts for such sale for a term not exceeding twenty years, and in the sale of such current by the board it shall give preference to States, counties, municipalities, and cooperative organizations of citizens or farmers, not organized or doing business for profit, but primarily for the purpose of supplying electricity to its own citizens or members: *Provided*, That all contracts made with private companies or individuals for the sale of power, which power is to be resold for a profit, shall contain a provision authorizing the board to cancel said contract upon five years' notice in writing, if the board needs said power to supply the demands of States, counties, or municipalities. In order to promote and encourage the fullest possible use of electric light and power on farms within reasonable distance of any of its transmission lines the board in its discretion shall have power to construct transmission lines to farms and small villages that are not otherwise supplied with electricity at reasonable rates, and to make such rules and regulations governing such sale and distribution of such electric power as in its judgment may be just and equitable: *Provided further*, That the board is hereby authorized and directed to make studies, experiments, and determinations to promote the wider and better use of electric power for agricultural and domestic use, or for small or local industries, and it may cooperate with State governments, or their subdivisions or agencies, with educational or research institutions, and with cooperatives or other organizations, in the application of electric power to the fuller and better balanced development of the resources of the region.

SEC. 11. It is hereby declared to be the policy of the Government so far as practical to distribute and sell the surplus power generated at Muscle Shoals equitably among the States, counties, and municipalities within transmission dis-

tance. This policy is further declared to be that the projects herein provided for shall be considered primarily as for the benefit of the people of the section as a whole and particularly the domestic and rural consumers to whom the power can economically be made available, and accordingly that sale to and use by industry shall be a secondary purpose, to be utilized principally to secure a sufficiently high load factor and revenue returns which will permit domestic and rural use at the lowest possible rates and in such manner as to encourage increased domestic and rural use of electricity. It is further hereby declared to be the policy of the Government to utilize the Muscle Shoals properties so far as may be necessary to improve, increase, and cheapen the production of fertilizer and fertilizer ingredients by carrying out the provisions of this Act.

SEC. 12. In order to place the board upon a fair basis for making such contracts and for receiving bids for the sale of such power, it is hereby expressly authorized, either from appropriations made by Congress or from funds secured from the sale of such power, or from funds secured by the sale of bonds hereafter provided for, to construct, lease, purchase, or authorize the construction of transmission lines within transmission distance from the place where generated, and to interconnect with other systems. The board is also authorized to lease to any person, persons, or corporation the use of any transmission line owned by the Government and operated by the board, but no such lease shall be made that in any way interferes with the use of such transmission line by the board: *Provided*, That if any State, county, municipality, or other public or cooperative organization of citizens or farmers, not organized or doing business for profit, but primarily for the purpose of supplying electricity to its own citizens or members, or any two or more of such municipalities or organizations, shall construct or agree to construct and maintain a properly designed and built transmission line to the Government reservation upon which is located a Government generating plant, or to a main transmission line owned by the Government or leased by the board and under the control of the board, the board is hereby authorized and directed to con-

tract with such State, county, municipality, or other organization, or two or more of them, for the sale of electricity for a term not exceeding thirty years; and in any such case the board shall give to such State, county municipality, or other organization ample time to fully comply with any local law now in existence or hereafter enacted providing for the necessary legal authority for such State, county, municipality, or other organization to contract with the board for such power: *Provided further,* That all contracts entered into between the Corporation and any municipality or other political subdivision or cooperative organization shall provide that the electric power shall be sold and distributed to the ultimate consumer without discrimination as between consumers of the same class, and such contract shall be voidable at the election of the board if a discriminatory rate, rebate, or other special concession is made or given to any consumer or user by the municipality or other political subdivision or cooperative organization: *And provided further,* That as to any surplus power not so sold as above provided to States, counties, municipalities, or other said organizations, before the board shall sell the same to any person or corporation engaged in the distribution and resale of electricity for profit, it shall require said person or corporation to agree that any resale of such electric power by said person or corporation shall be made to the ultimate consumer of such electric power at prices that shall not exceed a schedule fixed by the board from time to time as reasonable, just, and fair; and in case of any such sale, if an amount is charged the ultimate consumer which is in excess of the price so deemed to be just, reasonable, and fair by the board, the contract for such sale between the board and such distributor of electricity shall be voidable at the election of the board: *And provided further,* That the board is hereby authorized to enter into contracts with other power systems for the mutual exchange of unused excess power upon suitable terms, for the conservation of stored water, and as an emergency or breakdown relief.

SEC. 13. Five per centum of the gross proceeds received by the board for the sale of power generated at Dam Num-

bered 2, or from any other hydropower plant hereafter constructed in the State of Alabama, shall be paid to the State of Alabama; and 5 per centum of the gross proceeds from the sale of power generated at Cove Creek Dam, hereinafter provided for, or any other dam located in the State of Tennessee, shall be paid to the State of Tennessee. Upon the completion of said Cove Creek Dam the board shall ascertain how much additional power is thereby generated at Dam Numbered 2 and at any other dam hereafter constructed by the Government of the United States on the Tennessee River, in the State of Alabama, or in the State of Tennessee, and from the gross proceeds of the sale of such additional power 2½ per centum shall be paid to the State of Alabama and 2½ per centum to the State of Tennessee. These percentages shall apply to any other dam that may hereafter be constructed and controlled and operated by the board on the Tennessee River or any of its tributaries, the main purpose of which is to control flood waters and where the development of electric power is incidental to the operation of such flood-control dam. In ascertaining the gross proceeds from the sale of such power upon which a percentage is paid to the States of Alabama and Tennessee, the board shall not take into consideration the proceeds of any power sold or delivered to the Government of the United States, or any department or agency of the Government of the United States, used in the operation of any locks on the Tennessee River or for any experimental purpose, or for the manufacture of fertilizer or any of the ingredients thereof, or for any other governmental purpose: *Provided,* That the percentages to be paid to the States of Alabama and Tennessee, as provided in this section, shall be subject to revision and change by the board, and any new percentages established by the board, when approved by the President, shall remain in effect until and unless again changed by the board with the approval of the President. No change of said percentages shall be made more often than once in five years, and no change shall be made without giving to the States of Alabama and Tennessee an opportunity to be heard.

SEC. 14. The board shall make a thorough investigation as to the present value of Dam Numbered 2, and the steam plants at nitrate plant numbered 1, and nitrate plant numbered 2, and as to the cost of Cove Creek Dam, for the purpose of ascertaining how much of the value or the cost of said properties shall be allocated and charged up to (1) flood control, (2) navigation, (3) fertilizer, (4) national defense, and (5) the development of power. The findings thus made by the board, when approved by the President of the United States, shall be final, and such findings shall thereafter be used in all allocation of value for the purpose of keeping the book value of said properties. In like manner, the cost and book value of any dams, steam plants, or other similar improvements hereafter constructed and turned over to said board for the purpose of control and management shall be ascertained and allocated.

SEC. 15. In the construction of any future dam, steam plant, or other facility, to be used in whole or in part for the generation or transmission of electric power the board is hereby authorized and empowered to issue on the credit of the United States and to sell serial bonds not exceeding $50,000,000 in amount, having a maturity not more than fifty years from the date of issue thereof, and bearing interest not exceeding 3½ per centum per annum. Said bonds shall be issued and sold in amounts and prices approved by the Secretary of the Treasury, but all such bonds as may be so issued and sold shall have equal rank. None of said bonds shall be sold below par, and no fee, commission, or compensation whatever shall be paid to any person, firm, or corporation for handling, negotiating the sale, or selling the said bonds. All of such bonds so issued and sold shall have all the rights and privileges accorded by law to Panama Canal bonds, authorized by section 8 of the Act of June 28, 1902, chapter 1302, as amended by the Act of December 21, 1905 (ch. 3, sec. 1, 34 Stat. 5), as now compiled in section 743 of title 31 of the United States Code. All funds derived from the sale of such bonds shall be paid over to the Corporation.

SEC. 16. The board, whenever the President deems it advisable, is hereby empowered and directed to complete Dam

Numbered 2 at Muscle Shoals, Alabama, and the steam plant at nitrate plant numbered 2, in the vicinity of Muscle Shoals, by installing in Dam Numbered 2 the additional power units according to the plans and specifications of said dam, and the additional power unit in the steam plant at nitrate plant numbered 2.

SEC. 17. The Secretary of War, or the Secretary of the Interior, is hereby authorized to construct, either directly or by contract to the lowest responsible bidder, after due advertisement, a dam in and across Clinch River in the State of Tennessee, which has by long custom become known and designated as the Cove Creek Dam, together with a transmission line from Muscle Shoals, according to the latest and most approved designs, including power house and hydroelectric installations and equipment for the generation of power, in order that the waters of the said Clinch River may be impounded and stored above said dam for the purpose of increasing and regulating the flow of the Clinch River and the Tennessee River below, so that the maximum amount of primary power may be developed at Dam Numbered 2 and at any and all other dams below the said Cove Creek Dam: *Provided, however,* That the President is hereby authorized by appropriate order to direct the employment by the Secretary of War, or by the Secretary of the Interior, of such engineer or engineers as he may designate, to perform such duties and obligations as he may deem proper, either in the drawing of plans and specifications for said dam, or to perform any other work in the building or construction of the same. The President may, by such order, place the control of the construction of said dam in the hands of such engineer or engineers taken from private life as he may desire: *And provided further,* That the President is hereby expressly authorized, without regard to the restriction or limitation of any other statute, to select attorneys and assistants for the purpose of making any investigation he may deem proper to ascertain whether, in the control and management of Dam Numbered 2, or any other dam or property owned by the Government in the Tennessee River Basin, or in the authorization of any improvement therein, there has been any undue or unfair

advantage given to private persons, partnerships, or corporations, by any officials or employees of the Government, or whether in any such matters the Government has been injured or unjustly deprived of any of its rights.

SEC. 18. In order to enable and empower the Secretary of War, the Secretary of the Interior, or the board to carry out the authority hereby conferred, in the most economical and efficient manner, he or it is hereby authorized and empowered in the exercise of the powers of national defense in aid of navigation, and in the control of the flood waters of the Tennessee and Mississippi Rivers, constituting channels of interstate commerce, to exercise the right of eminent domain for all purposes of this Act, and to condemn all lands, easements, rights of way, and other area necessary in order to obtain a site for said Cove Creek Dam, and the flowage rights for the reservoir of water above said dam, and to negotiate and conclude contracts with States, counties, municipalities, and all State agencies and with railroads, railroad corporations, common carriers, and all public utility commissions and any other person, firm, or corporation, for the relocation of railroad tracks, highways, highway bridges, mills, ferries, electric-light plants, and any and all other properties, enterprises, and projects whose removal may be necessary in order to carry out the provisions of this Act. When said Cove Creek Dam, transmission line, and power house shall have been completed, the possession, use, and control thereof shall be intrusted to the Corporation for use and operation in connection with the general Tennessee Valley project, and to promote flood control and navigation in the Tennessee River.

SEC. 19. The Corporation, as an instrumentality and agency of the Government of the United States for the purpose of executing its constitutional powers, shall have access to the Patent Office of the United States for the purpose of studying, ascertaining, and copying all methods, formulæ, and scientific information (not including access to pending applications for patents) necessary to enable the Corporation to use and employ the most efficacious and economical process for the production of fixed nitrogen, or

any essential ingredient of fertilizer, or any method of improving and cheapening the production of hydroelectric power, and any owner of a patent whose patent rights may have been thus in any way copied, used, infringed, or employed by the exercise of this authority by the Corporation shall have as the exclusive remedy a cause of action against the Corporation to be instituted and prosecuted on the equity side of the appropriate district court of the United States, for the recovery of reasonable compensation for such infringement. The Commissioner of Patents shall furnish to the Corporation, at its request and without payment of fees, copies of documents on file in his office: *Provided*, That the benefits of this section shall not apply to any art, machine, method of manufacture, or composition of matter, discovered or invented by such employee during the time of his employment or service with the Corporation or with the Government of the United States.

SEC. 20. The Government of the United States hereby reserves the right, in case of war or national emergency declared by Congress, to take possession of all or any part of the property described or referred to in this Act for the purpose of manufacturing explosives or for other war purposes; but, if this right is exercised by the Government, it shall pay the reasonable and fair damages that may be suffered by any party whose contract for the purchase of electric power or fixed nitrogen or fertilizer ingredients is hereby violated, after the amount of the damages has been fixed by the United States Court of Claims in proceedings instituted and conducted for that purpose under rules prescribed by the court.

SEC. 21. (a) All general penal statutes relating to the larceny, embezzlement, conversion, or to the improper handling, retention, use or disposal of public moneys or property of the United States, shall apply to the moneys and property of the Corporation and to moneys and properties of the United States intrusted to the Corporation.

(b) Any person who, with intent to defraud the Corporation, or to deceive any director, officer, or employee of the Corporation or any officer or employee of the United

States (1) makes any false entry in any book of the Corporation, or (2) makes any false report or statement for the Corporation, shall, upon conviction thereof, be fined not more than $10,000 or imprisoned not more than five years, or both.

(c) Any person who shall receive any compensation, rebate, or reward, or shall enter into any conspiracy, collusion, or agreement, express or implied, with intent to defraud the Corporation or wrongfully and unlawfully to defeat its purposes, shall, on conviction thereof, be fined not more than $5,000 or imprisoned not more than five years, or both.

SEC. 22. To aid further the proper use, conservation, and development of the natural resources of the Tennessee River drainage basin and of such adjoining territory as may be related to or materially affected by the development consequent to this Act, and to provide for the general welfare of the citizens of said areas, the President is hereby authorized, by such means or methods as he may deem proper within the limits of appropriations made therefor by Congress, to make such surveys of and general plans for said Tennessee basin and adjoining territory as may be useful to the Congress and to the several States in guiding and controlling the extent, sequence, and nature of development that may be equitably and economically advanced through the expenditure of public funds, or through the guidance or control of public authority, all for the general purpose of fostering an orderly and proper physical, economic, and social development of said areas; and the President is further authorized in making said surveys and plans to cooperate with the States affected thereby, or subdivisions or agencies of such States, or with cooperative or other organizations, and to make such studies, experiments, or demonstrations as may be necessary and suitable to that end.

SEC. 23. The President shall, from time to time, as the work provided for in the preceding section progresses, recommend to Congress such legislation as he deems proper to carry out the general purposes stated in said section.

and for the especial purpose of bringing about in said Tennessee drainage basin and adjoining territory in conformity with said general purposes (1) the maximum amount of flood control; (2) the maximum development of said Tennessee River for navigation purposes; (3) the maximum generation of electric power consistent with flood control and navigation; (4) the proper use of marginal lands; (5) the proper method of reforestation of all lands in said drainage basin suitable for reforestation; and (6) the economic and social well-being of the people living in said river basin.

SEC. 24. For the purpose of securing any rights of flowage, or obtaining title to or possession of any property, real or personal, that may be necessary or may become necessary in the carrying out of any of the provisions of this Act, the President of the United States for a period of three years from the date of the enactment of this Act, is hereby authorized to acquire title in the name of the United States to such rights or such property, and to provide for the payment for same by directing the board to contract to deliver power generated at any of the plants now owned or hereafter owned or constructed by the Government or by said Corporation, such future delivery of power to continue for a period not exceeding thirty years. Likewise, for one year after the enactment of this Act, the President is further authorized to sell or lease any parcel or part of any vacant real estate now owned by the Government in said Tennessee River Basin, to persons, firms, or corporations who shall contract to erect thereon factories or manufacturing establishments, and who shall contract to purchase of said Corporation electric power for the operation of any such factory or manufacturing establishment. No contract shall be made by the President for the sale of any of such real estate as may be necessary for present or future use on the part of the Government for any of the purposes of this Act. Any such contract made by the President of the United States shall be carried out by the board: *Provided*, That no such contract shall be made that will in any way abridge or take away the preference right to purchase power given in this Act to States, counties, municipalities,

or farm organizations: *Provided further*, That no lease shall be for a term to exceed fifty years: *Provided further*, That any sale shall be on condition that said land shall be used for industrial purposes only.

SEC. 25. The Corporation may cause proceedings to be instituted for the acquisition by condemnation of any lands, easements, or rights of way which, in the opinion of the Corporation, are necessary to carry out the provisions of this Act. The proceedings shall be instituted in the United States district court for the district in which the land, easement, right of way, or other interest, or any part thereof, is located, and such court shall have full jurisdiction to divest the complete title to the property sought to be acquired out of all persons or claimants and vest the same in the United States in fee simple, and to enter a decree quieting the title thereto in the United States of America.

Upon the filing of a petition for condemnation and for the purpose of ascertaining the value of the property to be acquired, and assessing the compensation to be paid, the court shall appoint three commissioners who shall be disinterested persons and who shall take and subscribe an oath that they do not own any lands, or interest or easement in any lands, which it may be desirable for the United States to acquire in the furtherance of said project, and such commissioners shall not be selected from the locality wherein the land sought to be condemned lies. Such commissioners shall receive a per diem of not to exceed $15 for their services, together with an additional amount of $5 per day for subsistence for time actually spent in performing their duties as commissioners.

It shall be the duty of such commissioners to examine into the value of the lands sought to be condemned, to conduct hearings and receive evidence, and generally to take such appropriate steps as may be proper for the determination of the value of the said lands sought to be condemned, and for such purpose the commissioners are authorized to administer oaths and subpœna witnesses, which said witnesses shall receive the same fees as are provided for witnesses in the Federal courts. The said commissioners shall thereupon file a report setting forth their conclusions as to

the value of the said property sought to be condemned, making a separate award and valuation in the premises with respect to each separate parcel involved. Upon the filing of such award in court the clerk of said court shall give notice of the filing of such award to the parties to said proceeding, in manner and form as directed by the judge of said court.

Either or both parties may file exceptions to the award of said commissioners within twenty days from the date of the filing of said award in court. Exceptions filed to such award shall be heard before three Federal district judges unless the parties, in writing, in person, or by their attorneys, stipulate that the exceptions may be heard before a lesser number of judges. On such hearing such judges shall pass de novo upon the proceedings had before the commissioners, may view the property, and may take additional evidence. Upon such hearings the said judges shall file their own award, fixing therein the value of the property sought to be condemned, regardless of the award previously made by the said commissioners.

At any time within thirty days from the filing of the decision of the district judges upon the hearing on exceptions to the award made by the commissioners, either party may appeal from such decision of the said judges to the circuit court of appeals, and the said circuit court of appeals shall upon the hearing on said appeal dispose of the same upon the record, without regard to the awards or findings theretofore made by the commissioners or the district judges, and such circuit court of appeals shall thereupon fix the value of the said property sought to be condemned.

Upon acceptance of an award by the owner of any property herein provided to be appropriated, and the payment of the money awarded or upon the failure of either party to file exceptions to the award of the commissioners within the time specified, or upon the award of the commissioners, and the payment of the money by the United States pursuant thereto, or the payment of the money awarded into the registry of the court by the Corporation, the title to said property and the right to the possession thereof shall pass to the United States, and the United States shall be

entitled to a writ in the same proceeding to dispossess the former owner of said property, and all lessees, agents, and attorneys of such former owner, and to put the United States, by its corporate creature and agent, the Corporation, into possession of said property.

In the event of any property owned in whole or in part by minors, or insane persons, or incompetent persons, or estates of deceased persons, then the legal representatives of such minors, insane persons, incompetent persons, or estates shall have power, by and with the consent and approval of the trial judge in whose court said matter is for determination, to consent to or reject the awards of the commissioners herein provided for, and in the event that there be no legal representatives, or that the legal representatives for such minors, insane persons, or incompetent persons shall fail or decline to act, then such trial judge may, upon motion, appoint a guardian ad litem to act for such minors, insane persons, or incompetent persons, and such guardian ad litem shall act to the full extent and to the same purpose and effect as his ward could act, if competent, and such guardian ad litem shall be deemed to have full power and authority to respond, to conduct, or to maintain any proceeding herein provided for affecting his said ward.

SEC. 26. The net proceeds derived by the board from the sale of power and any of the products manufactured by the Corporation, after deducting the cost of operation, maintenance, depreciation, amortization, and an amount deemed by the board as necessary to withhold as operating capital, or devoted by the board to new construction, shall be paid into the Treasury of the United States at the end of each calendar year.

SEC. 27. All appropriations necessary to carry out the provisions of this Act are hereby authorized.

SEC. 28. That all Acts or parts of Acts in conflict herewith are hereby repealed, so far as they affect the operations contemplated by this Act.

SEC. 29. The right to alter, amend, or repeal this Act is hereby expressly declared and reserved, but no such amend-

ment or repeal shall operate to impair the obligation of any contract made by said Corporation under any power conferred by this Act.

SEC. 30. The sections of this Act are hereby declared to be separable, and in the event any one or more sections of this Act be held to be unconstitutional, the same shall not affect the validity of other sections of this Act.

Approved May 18th, 1933.

[PUBLIC—No. 412—74TH CONGRESS.]
[H. R. 8632.]
AN ACT.

To amend an Act entitled "An Act to improve the navigability and to provide for the flood control of the Tennessee River; to provide for reforestation and the proper use of marginal lands in the Tennessee Valley; to provide for the agricultural and industrial development of said valley; to provide for the national defense by the creation of a corporation for the operation of Government properties at and near Muscle Shoals in the State of Alabama, and for other purposes", approved May 18, 1933.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That subdivision (i) of section 4 of the Act entitled "An Act to improve the navigability and to provide for the flood control of the Tennessee River; to provide for reforestation and the proper use of marginal lands in the Tennessee Valley; to provide for the agricultural and industrial development of said valley; to provide for the national defense by the creation of a corporation for the operation of Government properties at and near Muscle Shoals in the State of Alabama, and for other purposes", approved May 18, 1933, be, and the same is hereby, amended by adding thereto the following proviso: "*Provided*, That nothing contained herein or elsewhere in this Act shall be construed to deprive the Corporation of the rights conferred by the Act of February 26, 1931 (46 Stat. 1422, ch. 307, secs. 1 to 5, inclusive), as now compiled in sections 258a to 258e, inclusive, of Title 40 of the United States Code."

SEC. 2. That subdivision (j) of said section 4 of said Act be, and the same is hereby, amended to read as follows:

"(j) Shall have power to construct such dams, and reservoirs, in the Tennessee River and its tributaries, as in conjunction with Wilson Dam, and Norris, Wheeler, and Pickwick Landing Dams, now under construction, will provide a nine-foot channel in the said river and maintain a water supply for the same, from Knoxville to its mouth, and will best serve to promote navigation on the Tennessee River and its tributaries and control destructive flood waters in the Tennessee and Mississippi River drainage basins; and shall have power to acquire or construct power houses, power structures, transmission lines, navigation projects, and incidental works in the Tennessee River and its tributaries, and to unite the various power installations into one or more systems by transmission lines. The directors of the Authority are hereby directed to report to Congress their recommendations not later than April 1, 1936, for the unified development of the Tennessee River system."

SEC. 3. That said section 4 of said Act be, and the same is hereby, further amended by adding a new subdivision, (k), at the end of said section as follows:

"(k) At any time before the expiration of five years from the date when this section, as amended, becomes law may in the name of and as agent for the United States and subject to approval of the President, dispose of any of such real property as in the judgment of the Board may be no longer necessary in carrying out the purposes of this Act, but no land shall be conveyed on which there is a permanent dam, hydraulic power plant, fertilizer plant or munitions plant, heretofore or hereafter built by or for the United States or for the Authority."

SEC. 4. That subdivision (c) of section 5 of said Act be, and the same is hereby, amended to read as follows:

"(c) To cooperate with National, State, district, or county experimental stations or demonstration farms, with farmers, landowners, and associations of farmers or landowners, for the use of new forms of fertilizer or fertilizer

practices during the initial or experimental period of their introduction, and for promoting the prevention of soil erosion by the use of fertilizers and otherwise."

SEC. 5. That said Act be, and the same is hereby, further amended by adding a new section after section 9 of said Act, as follows:

"SEC. 9a. The Board is hereby directed in the operation of any dam or reservoir in its possession and control to regulate the stream flow primarily for the purposes of promoting navigation and controlling floods. So far as may be consistent with such purposes, the Board is authorized to provide and operate facilities for the generation of electric energy at any such dam for the use of the Corporation and for the use of the United States or any agency thereof, and the Board is further authorized, whenever an opportunity is afforded, to provide and operate facilities for the generation of electric energy in order to avoid the waste of water power, to transmit and market such power as in this act provided, and thereby, so far as may be practicable, to assist in liquidating the cost or aid in the maintenance of the projects of the Authority."

SEC. 6. That section 10 of said Act be, and the same is hereby, amended by adding thereto a proviso as follows: "*Provided further*, That the Board is authorized to include in any contract for the sale of power such terms and conditions, including resale rate schedules, and to provide for such rules and regulations as in its judgment may be necessary or desirable for carrying out the purposes of this Act, and in case the purchaser shall fail to comply with any such terms and conditions, or violate any such rules and regulations, said contract may provide that it shall be voidable at the election of the Board: *Provided further*, That in order to supply farms and small villages with electric power directly as contemplated by this section, the Board in its discretion shall have power to acquire existing electric facilities used in serving such farms and small villages: *And provided further*, That the terms 'States', 'counties', and 'municipalities' as used in this Act shall be construed to include the public agencies of any of them unless the context requires a different construction."

SEC. 7. That said Act be, and the same is hereby, further amended by adding a new section after section 12 of said Act, as follows:

"SEC. 12a. In order (1) to facilitate the disposition of the surplus power of the Corporation according to the policies set forth in this Act; (2) to give effect to the priority herein accorded to States, counties, municipalities, and nonprofit organizations in the purchase of such power by enabling them to acquire facilities for the distribution of such power; and (3) at the same time to preserve existing distribution facilities as going concerns and avoid duplication of such facilities, the Board is authorized to advise and cooperate with and assist, by extending credit for a period of not exceeding five years to, States, Counties, municipalities and nonprofit organizations situated within transmission distance from any dam where such power is generated by the Corporation in acquiring, improving, and operating (a) existing distribution facilities and incidental works, including generating plants; and (b) interconnecting transmission lines; or in acquiring any interest in such facilities, incidental works, and lines."

SEC. 8. That said Act be, and the same is hereby, further amended by adding to section 14 of said Act the following:

"The Board shall, on or before January 1, 1937, file with Congress a statement of its allocation of the value of all such properties turned over to said Board, and which have been completed prior to the end of the preceding fiscal year, and shall thereafter in its annual report to Congress file a statement of its allocation of the value of such properties as have been completed during the preceding fiscal year.

"For the purpose of accumulating data useful to the Congress in the formulation of legislative policy in matters relating to the generation, transmission, and distribution of electric energy and the production of chemicals necessary to national defense and useful in agriculture, and to the Federal Power Commission and other Federal and State agencies, and to the public, the Board shall keep complete accounts of its costs of generation, transmission, and distribution of electric energy and shall keep a complete ac-

count of the total cost of generating and transmission facilities constructed or otherwise acquired by the Corporation, and of producing such chemicals, and a description of the major components of such costs according to such uniform system of accounting for public utilities as the Federal Power Commission has, and if it have none, then it is hereby empowered and directed to prescribe such uniform system of accounting, together with records of such other physical data and operating statistics of the Authority as may be helpful in determining the actual cost and value of services, and the practices, methods, facilities, equipment, appliances, and standards and sizes, types, location, and geographical and economic integration of plants and systems best suited to promote the public interest, efficiency, and the wider and more economical use of electric energy. Such data shall be reported to the Congress by the Board from time to time with appropriate analyses and recommendations, and, so far as practicable, shall be made available to the Federal Power Commission and other Federal and State agencies which may be concerned with the administration of legislation relating to the generation, transmission, or distribution of electric energy and chemicals useful to agriculture. It is hereby declared to be the policy of this Act that, in order, as soon as practicable, to make the power projects self-supporting and self-liquidating, the surplus power shall be sold at rates which, in the opinion of the Board, when applied to the normal capacity of the Authority's power facilities, will produce gross revenues in excess of the cost of production of said power and in addition to the statement of the cost of power at each power station as required by section 9 (a) of the 'Tennessee Valley Act of 1933', the Board shall file with each annual report, a statement of the total cost of all power generated by it at all power stations during each year, the average cost of such power per kilowatt hour, the rates at which sold, and to whom sold, and copies of all contracts for the sale of power."

SEC. 9. That said Act be and the same is hereby further amended by adding after section 15 of said Act a new section as follows:

"SEC. 15a. With the approval of the Secretary of the Treasury, the Corporation is authorized to issue bonds not to exceed in the aggregate $50,000,000 outstanding at any one time, which bonds may be sold by the Corporation to obtain funds to carry out the provisions of section 7 of this amendatory Act. Such bonds shall be in such forms and denominations, shall mature within such periods not more than fifty years from the date of their issue, may be redeemable at the option of the Corporation before maturity in such manner as may be stipulated therein, shall bear such rates of interest not exceeding 3½ per centum per annum, shall be subject to such terms and conditions, shall be issued in such manner and amount, and sold at such prices, as may be prescribed by the Corporation, with the approval of the Secretary of the Treasury: *Provided*, That such bonds shall not be sold at such prices or on such terms as to afford an investment yield to the holders in excess of 3½ per centum per annum. Such bonds shall be fully and unconditionally guaranteed both as to interest and principal by the United States, and such guaranty shall be expressed on the face thereof, and such bonds shall be lawful investments, and may be accepted as security, for all fiduciary, trust, and public funds, the investment or deposit of which shall be under the authority or control of the United States or any officer or officers thereof. In the event that the Corporation should not pay upon demand, when due, the principal of, or interest on, such bonds, the Secretary of the Treasury shall pay to the holder the amount thereof, which is hereby authorized to be appropriated out of any moneys in the Treasury not otherwise appropriated, and thereupon to the extent of the amount so paid the Secretary of the Treasury shall succeed to all the rights of the holders of such bonds. The Secretary of the Treasury, in his discretion, is authorized to purchase any bonds issued hereunder, and for such purpose the Secretary of the Treasury is authorized to use as a public-debt transaction the proceeds from the sale of any securities hereafter issued under the Second Liberty Bond Act, as amended, and the purposes for which securities may be issued under such Act, as amended, are extended to include any purchases of the Corporation's bonds hereunder. The

Secretary of the Treasury may, at any time, sell any of the bonds of the Corporation acquired by him under this section. All redemptions, purchases, and sales by the Secretary of the Treasury of the bonds of the Corporation shall be treated as public-debt transactions of the United States. With the approval of the Secretary of the Treasury, the Corporation shall have power to purchase such bonds in the open market at any time and at any price. No bonds shall be issued hereunder to provide funds or bonds necessary for the performance of any proposed contract negotiated by the Corporation under the authority of section 7 of this amendatory Act until the proposed contract shall have been submitted to and approved by the Federal Power Commission. When any such proposed contract shall have been submitted to the said Commission, the matter shall be given precedence and shall be in every way expedited and the Commission's determination of the matter shall be final. The authority of the Corporation to issue bonds hereunder shall expire at the end of five years from the date when this section as amended herein becomes law, except that such bonds may be issued at any time after the expiration of said period to provide bonds or funds necessary for the performance of any contract entered into by the Corporation, prior to the expiration of said period, under the authority of section 7 of this amendatory Act."

SEC. 10. That section 26 of said Act be, and the same is hereby, amended to read as follows:

"SEC. 26. Commencing July 1, 1936, the proceeds for each fiscal year derived by the Board from the sale of power or any other products manufactured by the Corporation, and from any other activities of the Corporation including the disposition of any real or personal property, shall be paid into the Treasury of the United States at the end of each calendar year, save and except such part of such proceeds as in the opinion of the Board shall be necessary for the Corporation in the operation of dams and reservoirs, in conducting its business in generating, transmitting, and distributing electric energy and in manufacturing, selling, and distributing fertilizer and fertilizer ingredients. A con-

tinuing fund of $1,000,000 is also excepted from the requirements of this section and may be withheld by the Board to defray emergency expenses and to insure continuous operation: *Provided*, That nothing in this section shall be construed to prevent the use by the Board, after June 30, 1936, of proceeds accruing prior to July 1, 1936, for the payment of obligations lawfully incurred prior to such latter date."

SEC. 11. That said Act be, and the same is hereby, further amended by adding after section 26 of said Act a new section, as follows:

"SEC. 26a. The unified development and regulation of the Tennessee River system requires that no dam, appurtenant works, or other obstruction, affecting navigation, flood control, or public lands or reservations shall be constructed, and thereafter operated or maintained across, along, or in the said river or any of its tributaries until plans for such construction, operation, and maintenance shall have been submitted to and approved by the Board; and the construction, commencement of construction, operation, or maintenance of such structures without such approval is hereby prohibited. When such plans shall have been approved, deviation therefrom either before or after completion of such structures is prohibited unless the modification of such plans has previously been submitted to and approved by the Board.

"In the event the Board shall, within sixty days after their formal submission to the Board, fail to approve any plans or modifications, as the case may be, for construction, operation, or maintenance of any such structures on the Little Tennessee River, the above requirements shall be deemed satisfied, if upon application to the Secretary of War, with due notice to the Corporation, and hearing thereon, such plans or modifications are approved by the said Secretary of War as reasonably adequate and effective for the unified development and regulation of the Tennessee River system.

"Such construction, commencement of construction, operation, or maintenance of any structures or parts thereof in violation of the provisions of this section may be pre-

vented, and the removal or discontinuation thereof required by the injunction or order of any district court exercising jurisdiction in any district in which such structures or parts thereof may be situated, and the Corporation is hereby authorized to bring appropriate proceedings to this end.

"The requirements of this section shall not be construed to be a substitute for the requirements of any other law of the United States or of any State, now in effect or hereafter enacted, but shall be in addition thereto, so that any approval, license, permit, or other sanction now or hereafter required by the provisions of any such law for the construction, operation, or maintenance of any structures whatever, except such as may be constructed, operated, or maintained by the Corporation, shall be required, notwithstanding the provisions of this section."

SEC. 12. That said Act be, and the same is hereby, further amended by adding at the end of said Act a new section, as follows:

"SEC. 31. This Act shall be liberally construed to carry out the purposes of Congress to provide for the disposition of and make needful rules and regulations respecting Government properties entrusted to the Authority, provide for the national defense, improve navigation, control destructive floods, and promote interstate commerce and the general welfare, but no real estate shall be held except what is necessary in the opinion of the Board to carry out plans and projects actually decided upon requiring the use of such land: *Provided*, That any land purchased by the Authority and not necessary to carry out plans and projects actually decided upon shall be sold by the Authority as agent of the United States, after due advertisement, at public auction to the highest bidder, or at private sale as provided in section 3 of this amendatory Act."

SEC. 13. That section 4 of said Act of May 18, 1933 (48 Stat. 58), be amended by adding subsection (l) as follows:

"(l) Shall have power to advise and cooperate in the readjustment of the population displaced by the construction of dams, the acquisition of reservoir areas, the protection of watersheds, the acquisition of rights-of-way, and other

necessary acquisitions of land, in order to effectuate the purposes of the Act; and may cooperate with Federal, State, and local agencies to that end."

SEC. 14. That subsection (b) of section 9 of said Act be and the same is hereby amended to read as follows:

"(b) All purchases and contracts for supplies or services, except for personal services, made by the Corporation, shall be made after advertising, in such manner and at such times sufficiently in advance of opening bids, as the Board shall determine to be adequate to insure notice and opportunity for competition: *Provided*, That advertisement shall not be required when, (1) an emergency requires immediate delivery of the supplies or performance of the services; or (2) repair parts, accessories, supplemental equipment, or services are required for supplies or services previously furnished or contracted for; or (3) the aggregate amount involved in any purchase of supplies or procurement of services does not exceed $500; in which cases such purchases of supplies or procurement of services may be made in the open market in the manner common among businessmen: *Provided further*, That in comparing bids and in making awards the Board may consider such factors as relative quality and adaptability of supplies or services, the bidder's financial responsibility, skill, experience, record of integrity in dealing, ability to furnish repairs and maintenance services, the time of delivery or performance offered, and whether the bidder has complied with the specifications.

"The Comptroller General of the United States shall audit the transactions of the Corporation at such times as he shall determine, but not less frequently than once each governmental fiscal year, with personnel of his selection. In such connection he and his representatives shall have free and open access to all papers, books, records, files, accounts, plants, warehouses, offices, and all other things, property, and places belonging to or under the control of or used or employed by the Corporation, and shall be afforded full facilities for counting all cash and verifying transactions with and balances in depositaries. He shall make report of each such audit in quadruplicate, one copy for the President of the United States, one for the chairman of the Board, one

for public inspection at the principal office of the Corporation, and the other to be retained by him for the uses of the Congress: *Provided*, That such report shall not be made until the Corporation shall have had reasonable opportunity to examine the exceptions and criticisms of the Comptroller General or the General Accounting Office, to point out errors therein, explain or answer the same, and to file a statement which shall be submitted by the Comptroller General with his report. The expenses for each such audit shall be paid from any appropriation or appropriations for the General Accounting Office, and such part of such expenses as may be allocated to the cost of generating, transmitting, and distributing electric energy shall be reimbursed promptly by the Corporation as billed by the Comptroller General. The Comptroller General shall make special report to the President of the United States and to the Congress of any transaction or condition found by him to be in conflict with the powers or duties entrusted to the Corporation by law."

SEC. 15. That the sections of this Act are hereby declared to be separable, and in the event of any one or more sections of this Act, or parts thereof, be held to be unconstitutional, such holding shall not affect the validity of other sections or parts of this Act.

Approved, August 31, 1935.

APPENDIX "B".

IN THE DISTRICT COURT OF THE UNITED STATES FOR THE EASTERN DISTRICT OF TENNESSEE, NORTHERN DIVISION

In Equity. No. 228

THE TENNESSEE ELECTRIC POWER COMPANY *et al., Complainants,*

v.

TENNESSEE VALLEY AUTHORITY *et al., Defendants.*

Decided January 21st, 1938.

Before Allen, Circuit Judge, and Gore and Martin, District Judges.

ALLEN, *Circuit Judge:*

Complainants have filed a bill in equity praying for relief against the operation of the Tennessee Valley Authority Act of 1933, as amended (48 Stat. 58; 49 Stat. 1075; 16 U. S. C. 831 et seq.). The bill joins as defendants the Tennessee Valley Authority, the agency created by the Congress to carry out the provisions of these statutes, and Arthur E. Morgan, David E. Lilienthal, and Harcourt A. Morgan, who are the chief executive officers of the Authority and constitute its board of directors.

The complainants are nineteen companies generating, transmitting and distributing power within Tennessee, Alabama, Mississippi, North Carolina, South Carolina, Kentucky, Virginia, West Virginia, and Georgia, one of which, the Georgia Power Company has been enjoined from participating in this action by the United States District Court for the Northern District of Georgia (*Georgia Power Co. v. Tennessee Valley Authority*, 17 Fed. Supp. 769). This decree has been affirmed by the Court of Appeals for the Fifth Circuit (89 Fed. (2d) 218). For this reason we give no consideration to alleged competition of the Authority with the Georgia Power Company.

The complainants are in general owned by holding companies, as set forth in the findings of fact. They are all taxpayers, citizens of and authorized to do business within the states in which they operate, and none of them claims to operate under any exclusive franchise.

The bill cannot be summarized within the appropriate limits for a trial court's opinion. In addition to its seventy pages of pleading and sixty-five pages of exhibits, it contains within the bill itself much that is argumentative, repetitious and immaterial to the legal questions presented. It charges coercion, fraud and conspiracy on the part of the defendants officially and individually. It charges that Secretary Harold L. Ickes, Public Works Administrator, has joined with the Authority in certain coercion and conspiracy against the legal rights of these complainants. The argumentative matter and conclusions which we deem immaterial are so interwoven with allegations bearing upon the legal questions presented that it is impossible to extricate them. The same statement is true of the prayer. Paragraphs h, i, l, o, p and q of the prayer are considered by the court to have no relation to this case under *Ashwander* v. *Tennessee Valley Authority*, 297 U. S. 288, which held that such matter presents no justiciable controversy (p. 324). It suffices, therefore, to say that in its essential and material features the bill seeks a decree holding that the Tennessee Valley Authority Act of 1933 as amended, and the acts generally done by the board of directors thereunder and individually violate the Constitution of the United States. It seeks an injunction restraining the defendants, their agents and employees, from carrying out the provisions of the statute with reference to the sale of electric power, from purchasing, constructing or otherwise acquiring electric generating plants, transmission lines or distribution lines, or from selling electric energy, except such energy as may be produced at Wilson Dam, "to the extent the production and sale of power at Wilson Dam has been held legal." For practical purposes this bill seeks to enjoin the further construction of TVA dams now in process of construction in the Tennessee Valley, the construction of new dams in such valley for which specific ap-

propriation has been made by Congress, and the operation for generation and sale of electric power of all TVA dams built and to be built.

The answer denies the material allegations of the bill. Only one of the affirmative defenses requires special mention. The defendants claim that certain of the complainants are estopped to deny the constitutionality of the TVA statutes because of extensive purchases of power from the Authority. These purchases were made under the contract of January 4, 1934, by which certain complainants contracted with the Authority to transfer to the Authority their plants, lines, equipment, customers and franchises within certain counties within Mississippi and Alabama for a valuable consideration and upon the condition that the Authority would not operate within those states outside of the counties specified. The properties have been transferred and the contract to date has been fully performed. The court has ruled in favor of the complainants on this contention, and has held that the record presents no essential difference from the situation covered by the ruling as to estoppel in the *Ashwander* case, *supra*, at 323, and therefore this question will not be discussed.

After a trial which consumed about seven weeks, in which approximately 1,100 exhibits were offered, the material issues in the case as briefed, argued and outlined in the actual testimony are defined as follows:

(1) Whether the Authority is engaged in acts constituting in law malice, coercion, and duress, to the injury of complainants.

(2) Whether the Authority and the individual defendants have conspired with Secretary Ickes and the Public Works Administration to induce municipalities and cooperative associations through loan grant agreements from the Public Works Administration to set up their own distribution systems and to coerce them into executing contracts for purchase of TVA power by threat of denial or cancellation of such PWA loan grants.

(3) Whether the acts of the defendants are authorized by the TVA statutes.

(4) Whether the act itself is unconstitutional and void, and the acts done under it are illegal because the Congress is not empowered either under the interstate commerce clause, Art. I, Section 8, or under the national defense powers, Art. I, Section 8, of the United States Constitution, to enact the TVA statutes.

(5) Whether the generation of electricity at the TVA dams is unlawful because it is inconsistent with the regulation of interstate commerce, with flood control, with the improvement of navigation on a navigable river, and with purposes of national defense.

(6) Whether the method of disposition of electric energy authorized by the TVA statutes is appropriate and constitutional under the power to dispose of Government property conferred upon the Congress by Section 3 of Article IV of the Constitution.

Each of the dams constructed, in process of construction and proposed for the TVA system, while varying somewhat in use, as hereafter set forth, is a unit of an integrated multiple-purpose project, the system being designed for coordinated use of the full benefits of the river along the line of navigation, flood control, national defense and power development. Wherever water falls power is created, and one of the express purposes of the TVA statutes is that hydro-electric power so created shall be sold to assist in liquidating the cost of the project. This is in line with the general development of the conservation movement from 1908 to the present, as it relates to streams. See National Waterways Commission Report, Senate Document 469, 62d Congress, Second Session, Appendix I, pages 27, 52, 61, 82, 85, 87; Statement of Chairman of Federal Power Commission, House Document 395, 73d Congress, Second Session, page 54; Report of National Resources Board, pages 263, 264. Similar provisions on river projects have been embodied in previous legislation. In 1912 a statute was enacted authorizing the Secretary of War to provide in navigation dams, in order to make possible the economical future development of water power, such foundations, sluices, and other works as may be considered desirable

for the development of such power. 37 Stat. 233. The Boulder Dam Project Act of 1928 (45 Stat. 1057) provided for a multiple-purpose project for irrigation, flood control, improvement of navigation and generation of power. As fully appears from the opinion in *Arizona* v. *California,* 283 U. S. 423, navigation on the Colorado River was negligible in comparison with navigation on the Tennessee River on the record in this case. Though navigation on the Colorado River had ceased, the project of reclaiming its navigability was held by the Supreme Court to establish the constitutionality of the multiple-purpose project, including the generation and sale of power.

TVA Project

Pursuant to the TVA statute as amended and to subsequent related enactments, the Authority has constructed and is planning to construct seven high dams on the main channel of the Tennessee River, and certain dams on its tributaries. The Tennessee River is formed by the confluence of the Holston and French Broad Rivers in the east-central part of Tennessee. It flows southwesterly across the eastern part of Tennessee into Alabama, westerly across the northern part of Alabama, northerly between Alabama and Mississippi, and across the western part of Tennessee and Kentucky, and empties into the Ohio River near Paducah, Kentucky. Its length is 652 miles, and its drainage basin is 40,600 square miles. It has eight principal tributaries. The main stream dams, including Wilson, which was constructed previous to 1933, are as follows:

(1) Gilbertsville, on which preliminary investigations are in progress, located in Kentucky about 22 miles from the mouth of the river.

(2) Pickwick Landing Dam, under construction and almost completed, located in Tennessee about 206 miles from the river's mouth.

(3) Wilson Dam, now in operation, constructed by United States Army engineers and transferred to the Authority

under the TVA Act, located at Muscle Shoals, Alabama, about 259 miles from the river's mouth.

(4) Wheeler Dam, construction of which was begun by the United States Army Engineers and completed by the Authority, located in Alabama about 15 miles above Wilson Dam and about 275 miles from the river's mouth. This dam is now in operation.

(5) Guntersville Dam, under construction, located near Guntersville, Alabama, 349 miles from the mouth of the river.

(6) Chickamauga Dam, now under construction, located near Chattanooga, Tennessee, 471 miles from the mouth of the river.

(7) Watts Bar Dam, on which preliminary investigations are in progress, located in Tennessee about 530 miles from the mouth of the river.

(8) Coulter Shoals Dam, on which preliminary investigations are in progress, located in Tennessee 602 miles from the river's mouth.

The tributary dams are Norris, completed and in operation, located in Tennessee on the Clinch River about 79 miles from the mouth of the Clinch and about 647 miles from the mouth of the Tennessee, and Hiwassee Dam, now under construction, located in North Carolina on the Hiwassee River about 75 miles from the mouth of that river and about 560 miles from the mouth of the Tennessee River.

A third tributary reservoir, Fontana, on the French Broad River, is recommended by the Authority, but the Congress has made no specific appropriation for this suggested dam. While Wheeler and Norris are the only dams built by the Authority which are completed and in operation, they coordinate in use with Wilson at Florence, Alabama. They release water to Wilson, and thus aid in the generation of power at Wilson. Wilson Dam was built under the war powers of the Congress, as held in *Ashwander* v. *Tennessee Valley Authority, supra.* While the validity

of Wilson Dam is not and cannot be questioned, its present use in combination with Norris and Wheeler, and its future use in conjunction with Guntersville, Chickamauga and Hiwassee, all of these dams being upstream from Wilson and each being part of an integrated system built for the combined purposes of navigation, flood control, power and national defense, has immediate bearing on this case.

The importance of the Tennessee Drainage Basin has been recognized for over a century and repeated acts of Congress have provided for the canalization of different parts of the river. A canal with locks throughout the length of Muscle Shoals opened to navigation in 1834 fell into disuse. Another Muscle Shoals canal was completed about 1891. The Rivers and Harbors Act of 1890 provided that the Colbert Shoals section should be improved by a lock and a canal. In 1913 the Hale's Bar lock and dam, completed by private interests, provided a canalization of 33 miles of the river below Chattanooga. The Widow's Bar lock and dam below Hale's Bar was completed in 1926. Wilson Dam provided a canalized waterway for 15½ miles from Muscle Shoals. Lock No. 1, immediately below Wilson Dam, was completed in 1926.

These projects were in general unrelated and uncoordinated. This was the situation when a comprehensive survey of the Tennessee basin was ordered in five successive Acts of Congress from 1922 to 1928, resulting in the reports contained in House Document 328. This document contained an exhaustive report by the district engineer and comments thereon, together with recommendations made by the division engineer, the board of engineers for rivers and harbors, and the chief of engineers. It set forth alternate plans for securing a depth of nine feet in the main stream, that is, an improvement for navigation only, and also a plan for the development of the river and its tributaries for purposes of flood control, navigation and power. The suggested plan for the improvement of navigation only involved in one of its phases the building of 32 low dams which would provide a nine-foot navigable channel, but would have no value either for flood control or power.

HOUSE DOCUMENT 328.

The complainants vigorously assert that House Document 328 recommends the low dam plan, as distinguished from the TVA plan. It is of little assistance in this phase of the controversy to rely only upon the recommendations of the various engineers, without studying the text (House Document 328, pages 1-25). As to the report of the district engineer, of which the chief engineers said "There has never been presented to Congress a more thorough and exhaustive stu'y", the board of engineers for rivers and harbors, in its conclusions on the various projects presented, stated that "The construction of the storage reservoirs (on the tributaries) described in this report would have a favorable effect in reducing floods on the Tennessee River and on the lower portions of its tributaries" (p. 23). It declared that "The improvement of the Tennessee from its mouth to Knoxville by a series of low movable dams without power development would have practically no effect on floods" (p. 23). It also said, speaking of low-lift dams, that "Such a waterway would be inferior to the high-dam developments and would not permit the economical development of power" (p. 13). The board of engineers pointed out that in addition to having no value whatever for flood control, the 32 low dams, though less expensive to construct than the high dams, provided a navigation channel inferior to that of the high dam plan.

It stated its opinion that the river "has large potential value as a means of transportation and that its improvement to a depth of nine feet would ultimately make it an important feeder to the Ohio-Mississippi system" (p. 20). It concluded that "It is evident that the full utilization of the resources of this river for the public benefit requires its improvement by means of high dams built for the joint development of power and navigation."

These extracts show that consideration of the bare recommendations, apart from the conclusions expressed, are misleading. In the recommendations the division engineer disagreed with the district engineer who drew the report, as to his estimate of the amount of benefit to navigation. The

board of engineers disagreed on certain points with the division engineer, and the chief of engineers, in certain matters, disagreed with all of his subordinates. But the projects actually recommended by each of these engineers were not in essential features the same as those embodied in the TVA statutes. They provided for the development of the river by private interests, or by a combination of private interests and the Government.

In order to carry out this policy, the Rivers and Harbors Act was passed in 1930, extending to private interests on certain conditions the right to develop the river by a series of high dams in co-operation with the Government. No private interest availed itself of the opportunity and in 1933 Congress delegated the task to an agency of the Government.

The program adopted by the Authority, in its main features, and the choice of the sites for the various dams, follow the broader multiple-project plan outlined in House Document 328 (p. 43), commended by the board of engineers of rivers and harbors, as superior to the low dam plan. This multiple project contemplated the erection of seven high dams in the main stream (in addition to Wilson, which had already been built), and reservoirs on the tributaries.

Uses of the Dams.

The dams on the tributaries, as outlined in House Document 328, and as shown in the evidence, are used and to be used for flood control, water regulation, power and purposes of national defense. Of the completed dams, Norris is so constructed as to be able to retain the entire flood waters of the Clinch in flood season, and was in fact so operated in 1936 and 1937. In 1936 it averted a probable flood at Chattanooga. It also generates power. Releases of water from Norris in the dry season are now used for regulation of stream flow so as to maintain a seven-foot navigable channel throughout the summer. Similar releases will be necessary until the entire series of main-stream dams as planned has been completed. Wheeler backs the water of the Tennessee into a slack water pool providing nine-foot navigation to Guntersville. It generates power and has a

surcharge usable for flood control. It is uncontradicted that the releases from Norris and Wheeler, and from Hiwassee, Guntersville and Chickamauga, as planned, create and will create extra head for continuous water power at Wilson, and thus aid in the national defense. Cf. *Ashwander* v. *Tennessee Valley Authority, supra.*

Of the dams under construction, Guntersville, Chickamauga, and Pickwick Landing are essential to the maintenance of nine-foot navigation. Each of these dams is equipped with electric generators and has a substantial surcharge usable for flood control. Hiwassee, on a tributary, will be used mainly for flood control and power, and for aiding Wilson Dam with water releases at dry season. Until the project is completed it will assist in regulating stream flow, thus improving navigation. Gilbertsville, while authorized by Congress, has only been investigated and surveyed. The plans for this dam have necessarily been delayed because of its size and because of the difficulty of locating suitable rock foundation. It is reasonably estimated that Gilbertsville, when completed, will supply over 4,000,000 acre feet of flood storage, and it is the most important of the series for flood control on the Ohio and the Mississippi The Tennessee contributes materially to the flood crest on the Ohio at Cairo. Its flood flow is almost double its drainage area in relation to other feeders of the Mississippi, because of the high precipitation in the Tennessee Valley which varies from 47.5 inches per year at Knoxville to 51.2 at Paducah on the main stream. The Ohio with its tributaries, including the Tennessee, is the principal feeder to the Mississippi floods. All of the TVA dams, on both the river and the tributaries, are used so far as constructed, are planned, as shown by the official TVA reports, and are required under the statute, to be employed as an integrated, co-oridnated system for the combined purposes of navigation, flood control, power and national defense.

Conspiracy, Coercion and Unlawful Competition.

The bill charges a conspiracy to injure or destroy the complainants' business, to compete unlawfully, to breach the complainants' existing contracts with their customers, to

compel and coerce complainants to sell their plants at distress figures. It charges that the TVA has conspired with and practiced coercion upon municipalities and co-operatives to compel them to set up their own distribution systems for the purpose of selling TVA power at retail. If the record had substantiated the allegations of the bill, grave questions would have been presented. But these allegations have not been established. None of the complainants has sold its property except those covered by the contract of January 4, 1934, a contract entered into at arm's length and not even challenged by complainants as unfair. Since complainants have not sold, they have not been coerced to sell their properties, and the negotiations for sale presented in this record do not evidence acts deemed coercion under settled legal principles. No malice in law is shown on this record. The motive of officials who execute a law is immaterial, even though accompanied by a wrongful purpose. *Isbrandtsen-Moller Co.* v. *United States*, 300 U. S. 139, 145.

Unlawful Competition

Neither has unlawful competition been proved. The attempt to show that the Authority has endeavored to persuade complainants' customers to breach their existing contracts for purchase of power from complainants has totally failed. In every case where a customer of the complainants has been lost to the Authority, the cause has been not unlawful competition, but the lawful allurement of substantially lower prices. In every such case the change of relationship has occurred at a time when no contract with any of the complainants was in existence. In fact, it is shown that the TVA does not serve the complainants' customers with direct service except as to industrials and "ceded areas." Thus the municipalities now served by the TVA in Tennessee,—Dayton, Pulaski, and Dickson,—each generated its own power prior to the time when the TVA started selling them power. The positive statement is made by officers of the Mississippi Power & Light Company, the Franklin Power & Light Company, the Holston River Electric Company, the Birmingham Electric Company, the Carolina Power & Light Company, the Appa-

lachian Electric Power Company, the West Virginia Power Company, the Kingsport Company, the East Tennessee Light & Power Company, the Tennessee Eastern Company, and by the Southern Tennessee Power Company, that the TVA serves neither any of its customers direct, nor any wholesale customer by whom distribution is made to any of these utilities' former customers. The TVA serves certain cities and customers formerly served by the Alabama Power Company, but all of these customers are situated or reside within certain counties called the "ceded area" in which it was contracted in the agreement of January 4, 1934, by the Alabama Power Company, that its lines should be sold to the TVA within that area, and that the TVA should serve within that district and nowhere else in Alabama. The TVA is serving nowhere else in Alabama except within this area. The Mississippi Power Company has made a similar contract with the TVA, and the TVA is not serving outside of the "ceded area" in Mississippi. No fraudulent attempt has been made to secure complainants' markets. Whatever compulsion exists is the inevitable compulsion exercised by the fact that a competitor sells at lower rates than complainants. But if the operation of the TVA is legal, the complainants have no legal right not to be subjected to such competition even though it curtail or destroy their business. *Alabama Power Co.* v. *Ickes*, 293 U. S. —, decided January 3, 1938.

Conspiracy With Public Works Administration.

The complainants allege that the defendants have conspired with the Public Works Administration to finance the construction of duplicating distribution lines and systems in various municipalities and co-operatives for the purpose of using TVA power and selling that power at rates so low as to constitute competition destructive to complainants' business. Numerous contracts are introduced in evidence between the Public Works Administration and municipalities and co-operatives, providing for the financing of electrical distribution projects. The power is being sold, or is contracted to be sold, to these municipalities and co-operatives at wholesale by TVA.

The facts do not establish a conspiracy. It is not questioned that loans were made within the provisions of the Public Works Administration statute. The validity of that statute is not attacked in this proceeding, and we therefore assume that it is valid. The acts done by Secretary Ickes and his subordinates have been done under the purview of the controlling statute. Their acts are presmued to be valid. Where no fraud, malice, or coercion is shown, co-operative action by two groups of public officials in administering the provisions of two statutes, does not constitute conspiracy. The decisions relied on by complainants with respect to unlawful concert, plan or design, involve a plan either to commit an unlawful act or to commit acts otherwise lawful with the intent to violate a statute, or commit an unlawful act. Cf. *Swift and Company* v. *United States*, 196 U. S. 375. The acts done by the officials of the Public Works Administration in co-operation with the officials of the TVA, as shown by this record, were done with the intent to carry out the provisions of the Public Works Administration statute; the acts done by the TVA in co-operation with the Public Works Administration were done with the intent to carry out the TVA statute. Intent to execute a valid and existing law is not evidence of illegality. As to the transactions of the Public Works Administration, no evidence of conspiracy is presented.

Coercion Upon Municipalities and Co-Operatives.

Certain officials and employees of the TVA gave information, counsel and encouragement to municipalities and co-operatives at the request of such municipalities and co-operatives with respect to the general feasibility of setting up distribution systems for TVA power. The decision on such matters was made by the municipality or co-operative concerned. Under the statutes of Alabama, Tennessee and Mississippi, hereinafter cited, both municipalities and rural co-operatives are authorized to construct generating plants and distribution systems for the purpose of creating and distributing electric energy. Georgia has a similar statute concerning co-operatives. These cities and co-operatives were free to obtain information and counsel from

any source. In each case the decision of the municipality involved was made either by the citizens at an election, or by its duly elected officers. The decision of the co-operative involved was made by its lawful representatives. Presentation by the Authority of facts as to TVA rates and contracts for power given to citizens or officers of a city or rural co-operative at their request do not constitute intimidation or coercion.

DAMAGE.

The record shows that the sales of every one of these complainants and the proceeds of these sales have reached an all-time high in recent years. Several of the most important complainants recently extended their lines, built new plants, and acquired new equipment. The Authority concedes that it sells, or intends to sell, power within a 250-mile radius of the claimed operation of each of these companies, from some one of the dams, built or proposed in the TVA Unified Plan, at substantially lower rates, residential, industrial, and rural, than those of the complainants, and that some displacement of service will result. 250 miles is the distance within which electricity can feasibly be transported from each of the dams. As a result of the lower TVA rates, cities which formerly purchased power from some one of the complainants have taken steps to finance the construction of distribution systems, or have negotiated with the power companies to purchase the existing systems of the power companies, in many instances securing financial aid from the Public Works Administration with the express purpose of selling TVA power through the systems thus acquired. The city of Memphis has issued bonds for this purpose, and under the contract which the city has signed with the Authority, the Memphis Power & Light Company will be deprived of its greatest outlet. A similar proposition has been made, but not yet carried through, in Knoxville. If the arrangement is consummated, the Tennessee Public Service Company and the Carolina Power & Light Company will each be deprived of one of its most profitable customers. A similar situation exists in Chattanooga. The rural co-operatives distribute TVA power, but for the most part they reach areas not

formerly served by these complainants. The Monsanto Chemical Company, which has a large industrial plant near Columbia, Tennessee, has failed to renew its contract for the purchase of power from the Tennessee Electric Power Company, and the Volunteer Portland Cement Company took similar action in failing to renew its contract with the Tennessee Public Service Company.

In view of the inevitable effect of the lower rates of the TVA within this area, and the economic necessity forced upon the complainants of lowering their rates to meet the competitive rates of the Authority, we conclude that the record presents evidence of substantial future damage to these complainants. But such damage constitutes *damnum absque injuria* unless sales of power by the TVA are unlawful. *Alabama Power Co.* v. *Ickes, supra.*

We find in this record no coercion, conspiracy, malice or fraud on the part of the defendants. None existing, the operation of the Authority is lawful unless (1) the defendants are exceeding their statutory authority, or (2) the statute is unconstitutional.

Compliance with the Statute.

Section 9a of the statute reads as follows:

> "The Board is hereby directed in the operation of any dam or reservoir in its possession and control to regulate the stream flow primarily for the purposes of promoting navigation and controlling floods. So far as may be consistent with such purposes, the Board is authorized to provide and operate facilities for the generation of electric energy at any such dam for the use of the Corporation and for the use of the United States or any agency thereof, and the Board is further authorized, whenever an opportunity is afforded, to provide and operate facilities for the generation of electric energy in order to avoid the waste of water power, to transmit and market such power as in this Chapter provided, and thereby so far as may be practicable, to assist in liquidating the cost or aid in the maintenance of the projects of the Authority."

It is the principal contention of the complainants that this statute is a sham, pretense, and fraud, and these dams as built and planned cannot and will not be operated within the statute. We therefore consider the actual operation of the dams.

In Water Bulletin No. 1, dated June 30, 1936, adopted by the TVA Board, it was ordered that the reservoirs of the Authority be operated 'First, to serve as navigation channels and maintain navigation depths in the reaches of the river below the reservoirs; and Second, to reduce the magnitude of flood peaks below. Requirements for the control of malaria and temporary needs of construction shall be given due consideration. So far as consistent with the above procedure, as much water power available at the dam shall be converted into electricity as is feasible."

The complainants contend that this order is a sham, and that none of the dams can be or will be operated in compliance therewith. They direct a particular attack upon Norris, which is now completed and in operation. However, Water Bulletin No. 2, dated June 30, 1936, ordered that until further notice water be released from Norris reservoir so as to maintain as nearly as may be a constant flow at Florence, Alabama, of 15,000 c. f. s. The evident purpose was to maintain a constant and sufficient stream flow for Wilson Dam. This and succeeding water bulletins, which are in evidence, outlining the same general policy, have for one of their main purposes the increase of continuous water power at Wilson. Hence, operation of the dams above Wilson is clearly constitutional under the national defense powers of the Congress.

With reference to the general operation, a resolution of the TVA Board, adopted July 1, 1936, created a committee on water control operations, consisting of the chief water control planning engineer and the chief electrical engineer, which committee was and is authorized to prepare general regulations as to the control of water through the operation of reservoirs. The regulations are transmitted to the general manager in the form of bulletins, and at times of flood or emergency, oral instructions are also given. Woodward, the chief water control planning engineer, testified

that he prepares these bulletins and that none is issued without his approval. He stated that he was guided in his operations by the statute, and that the constant flow of 15,000 c. f. s. was maintained at Florence, Alabama, for the purpose of securing the necessary navigable dept in the river. Karr, electrical engineer at Norris, testified that if the limited instructions given to him for operation were such that he had either to violate the instructions or to leave a city without power, "some one would have to go without power temporarily." Woodward testified that he permits the use of the water for power, and in special cases, if extra water is wanted, it is given extra consideration. It is uncontroverted that the water control planning engineer is in direct charge of the regulation of water flow, and also that he regulates water flow from Norris primarily for navigation and flood control.

It appears that in actual operation there is a seasonal drawing down of Norris Dam so that extra storage space may be available during the flood season. Norris was actually operated during the flood of 1937 to reduce the crest on the Tennessee River and to reduce the crest on the Ohio at Cairo. The complainants' expert Kurtz was familiar with the fact that Norris was so operated. Power is produced at Norris. The defendants introduced detailed testimony as to the full amount of TVA power presently produced, the available facilities for generation, the possibilities for future generation, the present load and the load now contracted for.

Complainants urge that the estimated future TVA load set forth in the various TVA reports, and the load it may reasonably be expected to acquire because of its substantially lower rates, will demand that the dams built and to be built be operated in violation of the statute and not (as required in Sec. 9a) in the primary interest of navigation and flood control. But this point is completely refuted by the numerous TVA contracts which are in evidence and are described in the findings of fa

These contracts generally conta .. a clause relieving the Authority of any obligation to supply power when prevented by fire, accident, breakdown, act of God, or an

other causes beyond the Authority's control. Substantially all of these contracts contain the following provision: "Subject to the provisions of the Tennessee Valley Authority Act of 1933 as amended, the parties hereto agree as follows * * *." Under the familiar rule, this provision reads the statute, including its mandatory requirement that the dams and reservoirs be operated primarily for flood control and navigation, into every one of these contracts. Under the contracts with the Arkansas Power and Light Company, the Victor Chemical Works, the Aluminum Company of America dated July 30, 1937, and with the Electro-Metallurgical Company, which are contracts both for firm and secondary power, the Authority is expressly relieved of obligation to supply power when service is interrupted or suspended by reason of floods or back-water caused by floods.

Reading these contracts in conjunction with the statute and the general resolution governing water control above described, it is evident that the long-term contracts of the Authority strongly corroborate (1) the sincerity of the resolution and water bulletins establishing the system of water control in the interest of flood control and navigation; (2) the testimony of Woodward and Karr; (3) the uncontradicted facts as to the principles applied in the actual operation of the dams. The overwhelming weight of the testimony supports defendants' contention that the mandatory provision of the statute that navigation and flood control be given primary consideration both at the other dams, built and planned, and at Norris Dam, is at all times scrupulously followed and that the statute is neither violated nor exceeded.

CONSTITUTIONALITY OF TVA STATUTE MUST BE DETERMINED.

Since no fraud, coercion, conspiracy or malice is shown, and since the Authority has acted within the provisions of the statute under consideration, unless the statute itself is unconstitutional the dams are lawfully erected, the energy is lawfully created, and the water power is the property of the United States. *Ashwander* v. *Tennessee Valley Authority, supra.* It therefore is essential to the decision of the

case pleaded in the bill to determine the constitutionality of this statute.

THE STATUTE.

The complainants contend that the statute was enacted primarily for power purposes, and that flood control, navigation, and national defense are incidental and merely a cloak for the unlawful purpose of permitting the government to enter the power business. The defendants contend that the statute was passed and that dams were erected and are under construction, or were authorized, for the purpose of combined flood control, navigation, and national defense; and that the installation of generators, the creation of power and its sale, have been authorized by the Congress as an incident to the exercise of constitutional powers.

NATIONAL DEFENSE.

Article I, Sec. 8, sub-sec. 1 of the Constitution of the United States, provides that the Congress shall have power "to provide for the common defense and general welfare of the United States."

In pursuance of this power it may make all laws which shall be necessary and proper for carrying into execution the national defense powers. An express purpose of the Tennessee Valley Authority Act is that of maintaining the properties owned by the United States in the vicinity of Muscle Shoals, Alabama, in the interest of national defense. The amended Tennessee Valley Authority Act, Title 16, U. S. C. A., Section 831p, provides that "The Secretary of War, or the Secretary of the Interior, is hereby authorized to construct * * * a dam in and across Clinch River in the State of Tennessee, which has by long custom become known and designated as the Cove Creek Dam, together with a transmission line from Muscle Shoals, according to the latest and most approved designs, including power house and hydroelectric installations and equipment for the generation of power, in order that the waters of the said Clinch River may be impounded and stored above said dam for the purpose of increasing and regulating the flow of the Clinch River and the Tennessee River below, so that the maximum amount of primary power may be developed at Dam Num-

bered 2 and at any and all other dams below the said Cove Creek Dam * * *."

In compliance with this provision, Norris Dam was built and is being operated to create extra head of water power at Wilson Dam. This means that constitutional authority to construct Norris exists in addition to the congressional power to authorize the construction of this dam under other clauses of the Constitution of the United States.

Navigation and Flood Control.

The Constitution of the United States, Article I, Section 8, provides that the Congress shall have power to regulate interstate commerce. Commerce includes navigation. *Gibbons* v. *Ogden*, 9 Wheat. 1. Control of navigable waters embraces flood control.

The statute on its face repeatedly stresses navigation and flood control. The purpose clause of the act reads:

> "To improve the navigability and to provide for the flood control of the Tennessee River; to provide for reforestation and the proper use of marginal lands in the Tennessee Valley; to provide for the agricultural and industrial development of said valley; to provide for the national defense by the creation of a corporation for the operation of Government properties at and near Muscle Shoals in the State of Alabama, and for other purposes."

The first paragraph of the enactment creates the Authority for the purpose of maintaining and operating properties owned by the United States in the vicinity of Muscle Shoals in the interest of the national defense and "to improve navigation in the Tennessee River and to control the destructive flood waters in the Tennessee River and Mississippi River basins." The board of the Authority is given power (Section 4j) "to contruct such dams, and reservoirs, in the Tennessee River and its tributaries, as in conjunction with Wilson Dam, and Norris, Wheeler, and Pickwick Landing Dams * * * will provide a nine-foot channel in the said river and maintain a water supply for the same, from Knoxville to its mouth, and will best serve to promote navigation

on the Tennessee River and its tributaries and control destructive flood waters in the Tennessee and Mississippi River drainage basins." Other sections in which the purposes of navigation and flood control are stressed are Sections 13, 18, 23, and 26a. The most important section is 9a, heretofore quoted, which governs the operation of any dam or reservoir, in the possession and control of the board, and requires the board to regulate the stream flow primarily for the purposes of promoting navigation and controlling floods. Numerous specific provisions of the statute relate to the generation and sale of electric power for the purpose of assisting in liquidating the cost of these projects, but all of them are limited and controlled by this general provision in Section 9a.

Under the statute, therefore, the generation of electric energy is specifically required to be incidental to the exercise of constitutional powers under the interstate commerce clause, and the operation complies with this requirement. The record shows that the dams are adapted by their construction to combined use for flood control and improved navigation, and to generate electricity. All experts agree that the pondage at each of the dams on the main river and also at the storage dams on the tributaries can be drawn down, and that space thereby made available is capable of being used to store flood waters in the rainy season. It appears from the uncontroverted testimony that the erection of the main-river dams will create a nine-foot navigable channel. We find from the weight of the evidence that Norris has been used for the purpose of controlling floods. These facts are not controverted, except by opinion evidence.

Certain expert witnesses, in answer to hypothetical questions, stated that the dams might be operated for the primary purpose of power. Thousands of pages of testimony and exhibits were introduced to show that Congress might have adopted a better plan than the TVA Unified System. Experts equally qualified testified to the contrary.

The court is of opinion that the relative value of these various plans is immaterial, since it has been established that the TVA project is reasonably adapted to use for com-

bined flood control, navigation, power and national defense, and that in actual operation the creation of energy is subordinated to the needs of navigation and flood control.

In short, the contention that the statute and the unified project authorized therein are a sham and pretense is without foundation. It cannot be disputed that the river is navigable and that it occupies a strategic position with relation to floods, both within its own drainage area and on the Ohio-Mississippi. We are not at liberty to conclude that the river is not susceptible of development as an important waterway, nor that it cannot be regulated so as to assist substantially in the control of floods in the alluvial valley of the Mississippi as well as practically eliminating local floods on the Tennessee River. *Ashwander* v. *Tennessee Valley Authority, supra.* Norris will create additional power for use for purposes of national defense at Wilson. Hence, we are not at liberty to conclude that the Congress has not undertaken this specific development for purposes within its constitutional powers, nor that the construction of these high dams and reservoirs along the lines proposed is not an appropriate means to accomplish these legitimate ends. Cf. *Ashwander* v. *Tennessee Valley Authority, supra.* The dams and their power equipment, both constructed, under construction and authorized, must be taken to have been authorized, constructed and planned in the exercise of the constitutional functions of the Government.

Interference with States' Rights.

Complainants contend that the TVA statutes constitute an unlawful interference with the police power of the states because they regulate the rates of utilities which themselves are subject to state regulation. The statute does not fix, nor purport to fix, the complainants' rates. But the contention is that the lower rates of the TVA will inevitably force complainants to lower their rates, and also that the TVA in its operations is not subject to the police power of the state.

The Authority operates within four of the nine states in which these complainants do business, namely, Tennessee, Alabama, Mississippi, and Georgia, its contracts with cities

and co-operatives in Tennessee, Alabama and Mississippi being authorized by express legislation. All municipalities in these three states have the statutory power to own and operate electric distribution systems. General Laws of Mississippi, 1936, Ch. 185; Carmichael Act, Alabama Code, Section 2001 (1), et seq.; Public Acts of Tennessee, 1935, Ch. 32, Tennessee Code, Section 3708 (1) et seq. In Mississippi, Tennessee and Alabama, municipalities are expressly authorized to contract for TVA power and to make agreements with TVA as to resale rates. Ch. 271, General Laws of Mississippi, 1936; Ch. 37, Public Acts of Tennessee 1935, Tennessee Code, Section 3708 (96) et seq.; Alabama Code, Section 687 (62). In Mississippi, Tennessee and Alabama, non-profit membership corporations such as rural co-operatives may operate electric systems, purchase from TVA, and make contracts as to resale rates. This is also true in Georgia, where the North Georgia Membership Corporation is alleged to compete with the Tennessee Electric Power Company. Ch. 184, General Laws of Mississippi, 1936; Ch. 231, Public Acts of Tennessee, 1937, which is an amendment of the Electric Membership Corporation Act of 1935; Alabama Code, Section 687 (18), et seq.; Georgia Laws, 1937, p. 644.

The Supreme Court of Alabama has upheld the validity of the Carmichael Act (Section 2001 (1), et seq., Alabama Code) in *Oppenheim* v. *Florence*, 229 Ala. 50, 155 Sou. 859. The similar act relating to co-operatives was sustained by the Supreme Court of Alabama in *Alabama Power Co.* v. *Cullman County Electric Membership Corp.*, 174 Sou. 866. In Tennessee the Supreme Court has upheld the right of the cities of Memphis and Chattanooga to buy TVA power and to establish their own electric systems under special laws. *Memphis Power & Light Co.* v. *Memphis*, Dec. term, 1936; *Tennessee Electric Power Co.* v. *Chattanooga*, Dec. term, 1936; *Tennessee Public Service Co.* v. *Knoxville*, 170 Tenn. 40.

The actions which the complainants attack are authorized by the states themselves. It is strange doctrine that acts authorized by a sovereign state constitute interference with its sovereign rights because of the fact that they are also

authorized by the Federal Government. We think that deliberate cooperation between the state and the United States, authorized in each case both by the state legislature and by the Congress, constitutes no abdication of any state right.

Moreover, no state has intervened as a party in this proceeding to protest that its laws are violated by the TVA, and no regulatory commission is a party to this action. These complainants are not authorized to object on behalf of the states. *Georgia Power Co.* v. *Tennessee Valley Authority*, 14 Fed. Supp. 673, 676. Questions of the conflict of the TVA statute with the sovereign power of the states are not properly raised until the interested parties are before the court. *Georgia Power Co.* v. *Tennessee Valley Authority, supra.* The TVA statutes do not violate either the Ninth or the Tenth Amendment to the Constitution of the United States.

Since the United States has acquired these dam sites legally, the water power, the right to convert it into electric energy, and the energy produced constitute property belonging to the United States (*Ashwander* v. *Tennessee Valley Authority, supra*). This electric energy may be rightfully disposed of by the United States through the action of the Congress, under Section 3 of Article IV of the Constitution of the United States (*Ashwander* v. *Tennessee Valley Authority, supra*). Since floods frequently recur, and the needs of navigation are continuous, hydro-electric power generated at dams which control floods and improve navigation is continuously created, and the Government may adopt any appropriate constitutional means of disposing of the property. It is not limited in such disposition to a few, or to infrequent transactions. This is the inevitable logic of the *Ashwander* decision, *supra*, at 315, in which every kind of electric facility, many miles of distribution and transmission lines and continuous and permanent operation were called in question because the contract attacked in that case was the contract of January 4, 1934, in which certain of these complainants, for valuable consideration, ceded sixteen counties to the TVA for electric service.

While the Government, in selling its property, performs many functions that would be performed in the operation of a private business trading in similar property, inasmuch as the energy sold is created at dams lawfully erected within the Federal power, the Government in performing these functions is not entering into private business. It is merely using an appropriate method of disposing of its property. The Government may sell land belonging to the United States in competition with a real estate agency, carry parcels in competition with express companies, and manage and control its thousands of square miles of national parks even as a private company. The Government has an equal right to sell hydro-electric power, lawfully created, in competition with a private utility. There is no constitutional authority which denies the Government the right to seek a wider market (*Ashwander* v. *Tennessee Valley Authority, supra*), and the transmission and distribution lines erected are a proper facility for conveying the property of the United States to the market. The creation of the Authority is appropriate. The disposition of the energy is continuous and constant, and it is appropriate that a continuing agency be created in order to carry out this legitimate federal function.

We conclude that, since none of the complainants claims to operate under an exclusive franchise, no fraud, malice, coercion, or conspiracy exists; since the Authority is not exceeding its statutory powers, and since the statute is constitutional, the competition with these complainants is lawful. It follows that the holding in *Alabama Power Co.* v. *Ickes, supra,* recently decided, squarely applies. These complainants have no immunity from lawful competition, even if their business be curtailed or destroyed.

A decree will be entered denying the injunction sought, dismissing the bill of complainants, and taxing costs against the complainants. Findings of fact and conclusions of law will be filed.

APPENDIX "C".

Filed May 14, 1937. John W. Menzies, Clerk.

UNITED STATES CIRCUIT COURT OF APPEALS, SIXTH CIRCUIT.

No. 7606.

TENNESSEE VALLEY AUTHORITY *et al., Appellants,*

v.

THE TENNESSEE ELECTRIC POWER CO. *et al., Appellees.*

Appeal from the United States District Court for the Eastern District of Tennessee, Northern Division

Decided May 14, 1937

Before Moorman, Simons and Allen, Circuit Judges.

SIMONS, *Circuit Judge:*

Nineteen corporations in the business of generating, transmitting and distributing electric energy as public utilities in the area within and contiguous to the Tennessee river basin commenced a suit in the Chancery Court at Knoxville, Tennessee, against the Tennessee Valley Authority, a corporation organized under special act of Congress, and the three directors of that corporation, to restrain acts being performed or threatened under powers claimed to be conferred by the TVA Act. They allege such acts to be either unauthorized or conferred by an unconstitutional grant of power. The suit was removed by the defendants to the United States District Court for the Eastern District of Tennessee. There a temporary injunction was granted, and the appeal is from the interlocutory decree. The Georgia Power Company, one of the plaintiffs, being restrained by an injunctional order subsequently issued out of the District Court for the Northern District of Georgia, and the Alabama Power Company, another, similarly restrained by the District Court for the Northern District

of Alabama, withdraw their support of the decree, but the remaining plaintiffs defend it.

The bill charges the defendants with having promulgated a program for the construction, development and operation of a great Federally owned and operated public utility system for the generation, transmission and distribution of electricity, in all territory within physical transmission distance of the electric generating plants to be constructed under such program. It charges that with or without the authority of the act they contemplate construction of generating plants at 149 power sites on the Tennessee river and its tributaries, the construction of transmission and distribution lines to gridiron the entire area within 250 miles of such plants; that they plan to produce an amount of electric energy greatly exceeding the total consumption of the area, which includes all of the State of Tennessee and a large part of the six neighboring states. It charges that the execution of this program will irreparably injure if not wholly destroy the business and property of each of the plaintiffs, and that the defendants have already performed or are in process of performing a vast number of acts in the execution of their power program, which is being carried out as rapidly as possible. It charges the program itself, and all of the acts done pursuant to it to be unconstitutional and void, and that if the TVA Act purports to authorize such program, it is to that extent also unconstitutional and void. The defendants first challenged the jurisdiction of the court by motion to quash service of the subpœna, and later the sufficiency of the bill by a motion to dismiss. Upon the overruling of both motions they answered, denying the material allegations of the bill and challenging by supporting affidavits the right of the plaintiffs to either permanent or temporary relief. Their appeal not only assails the preliminary injunction, but brings up the jurisdictional and procedural questions decided against them below.

Jurisdiction must, of course, be first examined. The Tennessee Valley Authority is a public agency. By the terms of the statute creating it, its domicile is in Alabama. Therefore it is asserted that under the laws of Tennessee

actions against it are local and not transitory, and may be brought only in a court of competent jurisdiction at the place of its domicile, and this notwithstanding the fact that the bill charges lack of legal or constitutional authority for acts being or threatened to be performed in Tennessee.

Section 4, of the Tennessee Valley Authority Act, specifically provides that the corporation may sue and be sued in its corporate name. This provision is without qualification. Section 8 (a) is as follows:

> "The Corporation shall maintain its principal office in the immediate vicinity of Muscle Shoals, Alabama. The Corporation shall be held to be an inhabitant and resident of the Northern Judicial District of Alabama within the meaning of the laws of the United States relative to the venue of civil suits."

The laws relating to venue of civil suits are well understood, particularly since the clarification of their interpretation in *Lee v. Chesapeake & Ohio Ry. Co.*, 260 U. S. 653. The present suit was begun in a state court of Tennessee. Under the authority of § 28 of the Judicial Code it was removed to that United States district court within the jurisdiction of which the state court action was pending. Whether a suit may be removed depends upon whether it could have been brought originally in the Federal district courts, which by § 24 of the Judicial Code, so far as applicable, have original jurisdiction of all suits of a civil nature, at common law or in equity, which arise under the Constitution or laws of the United States. This being such a case, it could have been brought originally in a Federal court. The test of removability is not whether the suit could have been brought in the particular district to which it was removed, but whether it could have been brought at all in a Federal district court. The venue of such suit after removal is not the district in which it might have originally been brought, but is the district in which the case is pending, for the right to remove is a personal privilege of the defendant, which he may assert or may waive. *General Investment Co.* v. *Lake Shore & Michigan Southern Ry. Co.*, 260 U. S. 245, 275. No question of Federal juris-

diction here arises by virtue of § 8 (a) of the TVA Act, and the laws in respect to venue.

But while venue is waived by removal of a cause from a State into a Federal court, want of jurisdiction in the State court is not cured thereby, but may be asserted after removal is consummated. *Lambert Run Coal Co.* v. *Baltimore & Ohio R. R. Co.*, 258 U. S. 377; *Cain* v. *Commercial Publishing Co.*, 232 U. S. 124, 131; *General Investment Co.* v. *Lake Shore Ry., supra*, 288. It is first urged on behalf of the appellants that they may not be sued in Tennessee because no local statute specifically authorizes suit against a public agency. Section 8676, Shannon's Code, however, provides that any corporation claiming existence under the laws of the United States is subject to suit in Tennessee to the same extent as are local corporations. Denial of the applicability of this statute, based upon the rule that statutes which refer to corporations in general terms do not apply to public agencies, is not persuasive, for the Tennessee statute speaks not in general terms but with precision.

The principal challenge, however, to the jurisdiction of the Tennessee court is based upon the fact that the TVA Authority, being a public agency domiciled in Alabama, may not under the laws of Tennessee be sued in that state since actions against a public agency are local and not transitory, and suit may be brought against it only at its domicile. Authority for the Tennessee rule invoked is the leading case of *Board of Directors of St. Francis Levee District* v. *Bodkin Bros.*, 108 Tenn. 700. There a suit was brought in Tennessee against the Levee District, which was a public corporation of Arkansas authorized to build levees on the Mississippi river. The Arkansas statute authorized it to sue and be sued, but domiciled the corporation in Arkansas. The Supreme Court of Tennessee held actions against such a Board not transitory but local, and that they must be brought at the place of domicile, resting its conclusion upon a rule of public policy, convenience and comity, which requires that public bodies should not be subject to the burden of carrying on law suits in scattered courts, since such suits inevitably hinder and delay the successful conduct of governmental functions.

There is no challenge to the soundness of the rule of the Bodkin case. The question is whether it applies. The origin of, and the reasons underlying the rule were discussed by this court in *Park Co.* v. *City of Decatur*, 138 Fed. 550, 553. There a municipality of Illinois was sued by attachment in the courts of Kentucky. It was said, "As elsewhere, the municipalities of Illinois are localized in their sphere of operation. They have no legal presence elsewhere, and their officials do not and cannot ordinarily represent them abroad, certainly not for the purpose of receiving service of process against them, or giving jurisdiction over them in foreign courts. For this reason and because of the public inconvenience resulting from carrying on litigation in a distant forum, the rule has become quite generally recognized that such corporations cannot be sued elsewhere than in the venue of their location; and because the venue of the courts in the counties of England and the states of the Union is usually, if not universally, coextensive with the boundaries of such counties, the rule is stated in the terms that a suit against a city or town or other limited municipal district must be brought in the courts of the county, and the county itself is only suable there." In fact in *Pack, Wood & Co.* v. *The Township of Greenbush*, 62 Mich. 122, the court indicated that the agents of a township may not bind the township by their acts or doings beyond the limit of the township unless expressly or impliedly authorized, for the localities in which they may exercise and perform them are limited by the boundaries of the township and the county in which it is located. The jurisdiction of a court may not therefore follow the persons of public officers wherever they may go beyond the municipalities for which they were elected or chosen. The Bodkin case does not go beyond this. It construed the Arkansas statute as giving consent to suits against the levee board only where the Board had its situs. Since it cannot have a situs outside of the state of its creation it is not subject to suit in a foreign state, and the levee district as an agency of the government is analagous to counties, municipalities, boards of education and the like.

The Tennessee Valley Authority has no restricted situs. It is authorized under the act to carry on operations upon the Tennessee river and its tributaries without respect to state lines or the limits of judicial districts, and may acquire by purchase or condemnation anywhere, lands, easements or rights of way necessary to carry out the provisions of the act. In the exercise of the power of eminent domain conferred upon it, it may institute proceedings in any district court of the United States, within the jurisdiction of which required lands, easements, rights of way or other interests are located. Indeed, so unfettered is it by political subdivisions that commissioners who are to ascertain the value of property are not to be selected from the locality wherein land sought to be condemned lies. Residence is not synonymous with situs, and the act creating the Authority is replete with provisions pointing to its mobility and the transitory character of its activities. Neither the rule of the Bodkin case nor the reasons which gave it birth limit jurisdiction over an ambulatory corporation of this character to the courts of its domicile. The state court had jurisdiction, and the court below acquired it by removal. It becomes unnecessary to consider other bases of jurisdiction asserted by the plaintiffs.

The challenge to the sufficiency of the bill is based upon two main grounds. It is said that the bill is defective because premised upon an alleged power program which is non-justiciable and because of an improper joinder of parties and causes which renders the bill multifarious, in violation of Equity Rules 26 and 37. In our opinion the existence of multifariousness must depend upon whether a justiciable controversy is presented by allegations of irreparable injury flowing from the authorization, promulgation and substantial initiation of the power program described in the bill. If there is no justiciable controversy between plaintiffs as a class and defendants, and one does not arise in respect to any plaintiff until some concrete act threatening irreparable injury to it is committed or threatened, such as the invasion of its territory by competing lines, the building of generating stations within transmission dis-

tance of its customers or the like, then indeed the bill may be clearly multifarious, and as we understand the argument, so much the plaintiffs are ready to concede. But if the unitary power program, as permitted or commanded by the act, or as promulgated by the directors of the Authority, directly creates or imminently threatens irreparable injury to the plaintiffs, varying in degree, perhaps, in respect to each but identical in kind, then we fail to see misjoinder either of plaintiffs or causes of action, for "a bill is not multifarious that presents a common point of litigation, the decision of which will affect the whole subject matter, and will settle the rights of all the parties to the suit;" Equity Rules 28, U. S. C. A., 114, Compilers Note 227. The general principle is well understood.

In determining the sufficiency of the bill we are not required to examine anything but the structure of the bill itself. *Nelson* v. *Hill*, 5 How. 126, 132. It becomes necessary, therefore, to consider the case made by it. The general program has been described—it remains to consider the injury charged to flow therefrom. Each of the plaintiffs has, it is alleged, valid authority by franchise or otherwise, to carry on its business in the territory it serves either indeterminately or for a period of years. Each operates within transmission distance of electric generating plants constructed, under construction or proposed. Each owns property of great value for the distribution and generation of electric energy within its service territory, with rates fixed by state authority. Each is supplying public utility service as a going concern, with large investments devoted to that purpose. Each has numerous agreements with consumers and reasonable expectancy of renewal of contracts. Each has issued stocks and bonds purchased by the public on the faith and credit of its lawfully granted authority and the protection afforded such investments by the laws of the State and the Constitution of the United States. There exists, it is said, a common threat to the interests of each in that the Tennessee Valley Authority Act permits those charged with its administration to acquire and develop all the water power sites on the Tennessee river and its tributaries, to build and utilize steam plants auxiliary thereto,

to interconnect vast electric generating plants into a superpower system, to acquire and construct transmission or distribution lines throughout the transmission area of these plants, and to distribute and sell power so generated to domestic, commercial, municipal and industrial users of light and power, and the area embraced includes all or a substantial part of the territory in which each plaintiff operates.

In short, it is asserted that the Act permits or commands, and the defendants propose, the construction, development and operation of a mammoth Federally owned and operated system for the generation and distribution of electricity in competition with each plaintiff through all or a substantial part of its territory. Electricity so produced will be sold at a price with which private producers cannot compete because its sale is to be subsidized by the public treasury. It is the purpose of the act and of the persons charged with its administration to eliminate all existing privately owned and operated utilities. Not only is the mere existence of the statute a threat to their business because it depresses the value of their present securities and destroys the market for additional securities required to permit expansion and modernization of properties, but the defendants are threatening to go beyond the clear authority of the act by constructing and operating hydro-electric plants with auxiliary steam plants, by interconnecting such plants into a vast power system, and so to take over the entire market for electricity in the area. The defendants have announced that unless existing utilities sell their transmission lines to them such lines will be duplicated. They have announced their intention to regulate local intrastate rates and service by a so-called "yardstick" method through Federally subsidized competition which will supplant state regulation as inadequate and unsatisfactory. Their power program will be carried out in Kentucky, Alabama, Georgia, North Carolina, Mississippi and Tennessee, and will include such cities as Chattanooga, Knoxville, Birmingham, Memphis and Atlanta. They have conspired with the Federal Public Works Administrator to force the existing utilities in the area, including the plaintiffs, to sell their properties for less than fair value, failing which their properties and services will be duplicated with

monies advanced by the Public Works Administration. In pursuance of this program, it is alleged, definite portions of the area have already been occupied, and the public has been offered contracts for electric energy at confiscatory prices in furtherance of a systematic campaign to injure the plaintiffs and destroy their credit and good will. The general allegations are supported by specific allegations, which it is neither necessary nor convenient to recite. In brief, as was urged in argument, the plaintiffs conceive themselves to be united by a common peril, and united therefore they complain.

To the justiciability of their common grievance, the defendants rely for a complete answer upon specific rulings of the Supreme Court in *Ashwander* v. *Tennessee Valley Authority*, 297 U. S. 288. They lay the bill in the Ashwander case by the side of the present bill, and by exhaustive comparative analysis urge the conclusiveness of that decision on the issue now under consideration. The "deadly parallel" is frequently devastating, but so only when controversies are substantially identical and of equal breadth. We have given careful consideration to the Ashwalder case. It sustains constitutional power of TVA to enter into a specific contract with the Alabama Power Company, one of the original plaintiffs in the present suit. That contract related solely to the purchase by TVA of transmission lines for disposal of excess energy generated at Wilson dam and for exchange of energy. The Ashwander case was a derivative suit brought by preferred stockholders of the Alabama Power Company to set aside the contract as ultra vires. By limitations imposed upon the court by the nature of the suit, and through limitations of the judicial process, the Ashwander case was kept within very narrow compass.

It is well understood, of course, that a stockholder may not maintain a suit in behalf of his corporation until he has made a demand upon the corporation that it do so, and the corporation has failed or refused to comply. The scope of the suit he may then maintain is limited by the scope of his demand. Ashwander and his fellow-stockholders were primarily concerned with the contract of January 4, 1934, for the sale by the Alabama Power Company of the transmis-

sion lines running from Wilson Dam. The electric energy there generated was more than sufficient to supply all the requirements of the contract. The issues were confined to the constitutional authority for the construction by TVA of Wilson Dam, and for its disposal by reasonable method of the electric energy there generated. Finding the construction of Wilson Dam a valid exercise of constitutional power under the war and commerce clauses, the electric energy there generated to be property of the United States, for the sale of which authority exists in § 3 of Article IV of the Constitution, and the method of disposal not inappropriate according to the nature of the property, the court refused to set aside the contract, the decision concluding with the following: "The question of the constitutional right of the Government to acquire or operate local or urban distribution systems is not involved. We express no opinion as to the validity of such an effort, as to the status of any other dam or power development in the Tennessee valley, whether connected with or apart from the Wilson Dam, or as to the validity of the Tennessee Valley Authority Act or of the claims made in the pronouncements and program of the authority apart from the questions we have discussed in relation to the particular provisions of the contract of January 4, 1934, affecting the Alabama Power Company."

It is true that the stockholders in the Ashwander case sought a declaratory judgment with respect to the constitutional validity of the entire Tennessee Valley activity, and that the court did not recognize in their challenge to the Act, or to other things done in pursuance thereof, a case of actual controversy within the scope of the act of June 14, 1934, providing for declaratory judgments, for "the judicial power does not extend to the determination of abstract questions," and a justiciable controversy does not arise save as pronouncements, policies and programs have "fruition in action of a definite and concrete character constituting an actual or threatened interference with the rights of the persons complaining." The court had clearly in mind, however, that the persons complaining in the Ashwander case were stockholders, whose interests might perhaps be affected by the invalidity of a specific contract entered into

by their corporation, but not necessarily or immediately affected by other acts or assertions of authority on the part of the Federal agency involved. This, we think, the court made plain: "While plaintiffs, as stockholders, might insist that the Board of Directors should take appropriate legal measures to extricate the corporation from particular transactions and agreements alleged to be invalid, plaintiffs had no right to demand that the directors should start a litigation to obtain a general declaration of the unconstitutionality of the Tennessee Valley Authority Act in all its bearings or a decision of abstract questions as to the right of the Authority and of the Alabama Power Company in possible contingencies."

The case made by the present bill presents a different aspect. Here are no preferred stockholders whose interests are limited to their distributive share in the assets of the corporation, and whose grievance is circumscribed by their own formulated estimate of it. Here are seventeen utility corporations already suffering the economic pinch of actual or threatened competition they conceive to be illegal, and facing what they conceive to be not only irreparable injury, but possible destruction, not through any one specific act of the defendants which singly considered may not be an unconstitutional exercise of power, but through a far flung program which they charge will inevitably effect and has for its very purpose their common annihilation. We are not convinced that the Ashwander decision precludes us from recognizing a justiciable controversy between these plaintiffs as a class and the Tennessee Valley Authority as an instrumentality of the Government involving the constitutional validity of the described program, whether authorized by the Act or transcending its authority.

Another consideration is of importance. Eighteen months have elapsed since the Ashwander decision in the Supreme Court. Three years have passed since the District Court announced the decision there reviewed. We are told that the program of the Tennessee Valley Authority and its directors has gone forward with all reasonable dispatch. What then may have been merely tentative or speculative may now be approaching realization. What then was re-

mote may now be imminent, and mere concept have fruition in action of a definite and concrete character constituting an actual or threatened interference with the rights of those complaining. This may only be determined by full hearing on the merits. Moreover, the distinction between the case here made and that presented by the bill in the Ashwander case is not only clear but is brought into bold relief by the dissenting opinion in the Ashwander case. The injury and threat of injury is here assigned not to a single act or series of acts, but to the entire program, the full sweep of which is illustrated by the acts already done and proposed. The primary grievance in the Ashwander case related to the constitutional power of TVA to execute a specific contract. It was thought by the plaintiffs there to demonstrate invalidity of the contract not merely by challenging the power of the Authority to execute it, but by challenging its power to promulgate and carry into execution a power program of which the assailed contract was but a part, and to test the validity of the very act under the authority of which the program was conceived—even to the extent of seeking a declaratory judgment thereon. The power program was involved only as its possible invalidity might infect with invalidity the assailed contract. The dissent makes it clear that the court rejected the theory that "the plan makes the part unlawful." So while it results that one may not secure relief against an act which is not itself an unconstitutional exercise of power, it also results that one may not complain of a plan which, though possibly open to attack on the ground of constitutional invalidity, does not as such injure him, and this is but an application of the familiar principle that courts will not pass upon the constitutionality of a statute per se, but will set it aside only when both invalidity and direct or imminent danger of injury to the persons complaining of its enforcement are made clear. *Massachusetts v. Mellon*, 262 U. S. 447. The court below did not err in overruling the motion to dismiss.

We reach, therefore, the question as to whether, upon the showing made, the plaintiffs have established their right to a temporary injunction of the scope granted, and upon this issue it is not necessary for us to determine the meritorious

question as to the constitutional validity of the power program, for the ultimate rights of the plaintiffs should be decided only when the court is "in possession of the materials necessary to enable it to do full and complete justice between the parties." *Eagle Glass & Mfg. Co.* v. *Rowe*, 245 U. S. 275; *Interstate Transit Co.* v. *City of Detroit*, 46 Fed. (2d) 42, (C. C. A. 6). Ordinarily upon an appeal from an interlocutory order granting or refusing a temporary injunction, the determination of the trial court will not be disturbed "unless contrary to some rule of equity or the result of improvident exercise of judicial discretion." *Meccano, Ltd.* v. *John Wanamaker*, 253 U. S. 136, 141; *City of Owensboro* v. *Cumberland T. N. T. Co.*, 174 Fed. 739, 747, (C. C. A. 6). The question here presented is not unattended with difficulty. It involves not only the substantial nature and debatable character of the claims of the plaintiffs, the probability of irreparable injury to them, the necessity and appropriateness of an injunction to maintain the status quo, but includes also the usual questions of balance of equities, and the possibility of severe damage to the defendants and to the public interest if the temporary injunction is wrongly issued. Relief is moreover based upon transgression of constitutional power by and under an act of Congress, and decision must ultimately if not presently be made with due regard to the presumption of validity that attaches to such enactment. Finally, the case presents the extraordinary situation in that the authority of the Congress to enact the statute in certain of is aspects, and to authorize thereby certain important transactions in respect to the construction of Wilson Dam, and to the sale and distribution by means of transmission lines of the electric energy there generated, has already been sustained by the Supreme Court, and that other acts and transactions here alleged to illustrate the sweep of the challenged power program are not readily to be distinguished from those heretofore validated. Granted that it is not necessary that the facts in support of a preliminary injunction be established with the same certainty that is required upon final hearing, and that we are not required to prejudge the meritorious controversy, yet it would seem that in a case of this kind, giving

full consideration to the history of the litigation, the gigantic public undertaking involved, the enormous sums of money already expended, the public interest which may not be ignored, and while carefully considering the irreparable injury claimed, considering also possible overbalancing injury to the defendants and the public, the gravity of the factual and constitutional questions involved must be made to appear at least with more clearness than in the ordinary case, if not indeed, as suggested in the concurring opinion in the Ashwander case, "beyond peradventure clear."

Pursuant to the TVA Act, the Tennessee Valley Authority has now completed and put into operation not only the Wilson Dam, in the vicinity of Muscle Shoals, but the Norris Dam on the Clinch river, a tributary of the Tennessee river, and the Wheeler Dam on the Tennessee river. It has also initiated the construction of dams on the Tennessee river at Pickwick Landing, Tennessee, at Gunthersville, Alabama, and Chickamauga, in the vicinity of Chattanooga, Tennessee, and has entered upon preliminary operations for the construction of the Hiwassee Dam on the Hiwassee river, near Murphy, North Carolina. It has also recommended to Congress the construction of three additional dams on the Tennessee river, which, it asserts, will complete the contemplated nine-foot channel from Paducah to Knoxville and provide a substantial measure of flood control on the Tennessee and Mississippi river systems. It has been selling approximately 75% of its available electric power to four of the plaintiffs, and its existing electric service is limited to consumers in the service area of these four companies and of three others complaining.

The District Judge found that the defendants had acquired or constructed extensive electric transmission and rural distribution facilities; had built and are building transmission lines which duplicate those of the plaintiffs; had erected a substantial number of miles of high tension transmission and distribution lines, most of them rural; were actively in competition with some of the plaintiffs, offering electric service at substantially lower rates, and that pending determination of the suit upon its merits the plaintiffs are in danger of irreparable injury through fur-

ther enlargement and extension of facilities, solicitation and negotiation of contracts with actual or potential customers in the plaintiffs' service area, and that loss to the defendants by reason of the injunction would not be comparable to the damage likely to be suffered by the plaintiffs in the event the injunction should issue. Though he deemed it immaterial, he also concluded that the facts of record supported the following proposed finding:

> "All of the transmission lines constructed or acquired, or under construction by the Tennessee Valley Authority, or physically connected with Wilson Dam are within transmission distance of Wilson Dam, except the Santeelah-Hiwassee Transmission line and substation. All of the power now being sold by the Authority is being delivered by means of these lines or by interchanges under the contract of January 4th. The present dependable capacity of Wilson Dam is in excess of the present power requirements of the existing customers of the Authority excluding complainant power companies. The present load now being sold to customers of the Authority other than the complainant power companies, is approximately 22,500 kw. The maximum amount of power that it is reasonably possible for the Authority to dispose of up to May 1st, 1937, by the use of facilities already existing or which may be constructed up to May 1st, 1937, is 37,000 kw."

Concluding that the suit raised grave questions both of law and of fact with reference to the validity of the Tennessee Valley Authority Act, and of the acts of the defendants done and being done in reliance upon it, he enjoined them from enlarging or extending their facilities other than the completion of certain lines and sub-stations in process of construction, from serving consumers not already served, from initiating new construction, from soliciting or negotiating contracts with customers of the plaintiffs, or consumers in their service areas, from supplying service connections to existing rural lines, and in the main from enlarging the service beyond the scope of the project already established. While it is unnecessary to recite all of the

provisions of the injunctional order, it must be conceded that it is sweeping. Less would perhaps not have sufficed the plaintiffs in view of the scope of their claims of irreparable injury, and more would doubtless have resulted in complete paralysis of the entire activity.

We have already indicated some of the considerations that must control decision upon the propriety of a temporary injunction. A complete catalogue cannot, of course, be compiled. A petitioner's own appraisal of his fears is not to be disregarded, so it is important to note that the bill when filed contained no prayer for preliminary relief, was not amended to pray for it until long after suit had been begun, and in this respect was brought up for hearing more than six months after its filing date. It is also important to note that the trial judge in the Ashwander case, although subsequently holding the Tennessee Valley Authority's disposal of power illegal, refused to grant a preliminary injunction, and that Judge Sibley of the Fifth Circuit Court of Appeals, sitting by designation in the Northern District of Georgia, likewise refused to preliminarily restrain the activity of the defendants in the area served by the Georgia Power Company, one of the original plaintiffs here (*Georgia Power Co.* v. *Tennessee Valley Authority et al.*, decided May 28, 1936).

However grandiose may be the conception of its directors as to ultimate scope of the TVA project, it is clear, we think, that the presently contemplated plan includes provision only for a nine-foot level for navigation and flood control purposes on the Tennessee river. This will be accomplished by the seven dams building and proposed. There is no occasion, therefore, on the question of irreparable injury *pendente lite* to consider the effect of 149 inter-connected power supplying projects upon the rights of the plaintiffs in the present inquiry, however important that may become on final hearing. Nor is it to be supposed that all or substantially all of the construction already entered upon or planned can possibly be completed before the pending case may be reached and tried upon its merits. The trial judge found substantial support for a finding that the maximum amount of power reasonably possible for the

6d

Authority to dispose of up to May 1, 1937, by the use of existing facilities, or those which might be constructed up to May 1, 1937, to be 37,000 kw. Without denying that some injury may be suffered if the injunction is lifted, it does not so clearly appear that it will of necessity overbalance the injury which must inevitably be suffered by the defendants and the public.

The possibility of maintaining the status quo by means of the injunction is not established. The court may not command the waters of the Tennessee river and its tributaries to cease their flow. The peculiar property that inheres in the power of falling water, and in the electric energy into which it may be translated, if not used, is forever lost. It is, moreover, inescapable that in the conduct of an activity of the size and scope herein delineated, a great organization must necessarily have been built up, including not only laborers, equipment and executives, but technological experts and specialists of many kinds. To appraise the injury to the defendants from the disorganization which must follow substantial or even partial cessation of activity is impossible, but that it will be great cannot be denied. So also in respect to the public interest involved. The loss, inconvenience and discomfort of the residents of the area in failing to obtain cheap electric energy, if it be found in the end that it may lawfully be supplied to them, may likewise not be measured, but equally incontrovertible is it that it will be great. Insofar, also, as restraint will delay effective control of the flood waters of the Tennessee river and its tributaries, the public interest in the achievement of that objective is similarly beyond appraisal. Human experience of the catastrophic effect upon great areas of overflowing rivers is too recent and too painful to permit of any doubt either as to the existence or extent of the public interest that is threatened by the maintenance of the injunction, and against which the threat to private interests must be balanced. From such possible injury it is clear no bond can adequately safeguard the public interest.

There is no occasion at this time to review the principles which govern courts in passing upon constitutional questions. The cases announcing them have been collected in

the concurring opinion of the Ashwander case, and public attention is presently focused upon them. The great power of the courts to set aside an act of Congress is exerted with reluctance in the ordinary case. It is invoked with even greater caution where great public enterprises are involved, and while it will be exercised only when it is absolutely necessary, this applies with even greater force on appeals from an interlocutory injunction [*Allen* v. *Omaha Live Stock Co.*, 275 Fed. 1, 3 (C. C. A. 8)], for as was said by Judge Learned Hand, "We are told that to declare a statute unconstitutional we must be assured beyond question that it is such. A temporary stay now is a declaration for a time that it is unconstitutional; it is to dispense with the statute until the case be finally decided." *Dryfoos* v. *Edwards*, 284 Fed. 596, 603.

It is our conclusion under all of the circumstances of the case that the interlocutory injunction was improvidently granted, and should be set aside. We have given serious consideration to both the private interests and the public enterprise involved, and while "Elusive interests of haste should not be permitted to obscure substantial requirements of ordinary procedure" (*Duke Power Co.* v. *Greenwood Co.*, 299 U. S. 259, 268), both are so important that undue delay in arriving at final judgment must likewise be avoided. To that end we have contributed as best we may by advancing the cause for argument and giving precedence to it in decision on present issues. We have no doubt that the District Judge, whose earnest application to the problems presented and whose courageous assumption of responsibility in respect to them is so evident upon this record, will cooperate with counsel to bring the cause to early hearing and disposition upon its merits.

Interlocutory decree reversed, and cause remanded for trial.

ALLEN, *Circuit Judge*, concurring:

I concur with the conclusion and in the main in the opinion, but think that in addition to ruling upon the questions raised in this appeal, the court should lay down rules for the guidance of trial courts as to the practice of issu-

ing temporary injunctions which in effect suspend the operation of statutes.

The considerations which govern the issuance of temporary injunctions in a suit between private parties have often been applied in injunction suits against public officials, where the damage to the public is readily ascertainable and where the public interest may be properly protected. However, the decisions recognize a clear distinction where the damage to the public cannot be readily appraised and where the acts complained of involve, as here, a public policy authorized by statute, ordinance or order of a duly constituted public board or officer. Cf. *Hurley* v. *Kincaid*, 285 U. S. 104, note; *Lagunitas Water Co.* v. *Marin County Water Co.*, 163 Cal. 332; *Jones* v. *Lassiter*, 169 N. C. 750; *Red C. Oil Mfg. Co.* v. *Board of Agriculture*, 172 Fed. 695, aff. 222 U. S. 380; *Berdan* v. *Passaic Valley Sewerage Commissioners*, 82 N. J. Eq. 235, aff. 83 N. J. Eq. 340. The public has an interest in the enforcement of all duly enacted law, and the citizens within the area of the Tennessee Valley Authority have a material and pecuniary interest in the enforcement of this particular law. *Railroad Commission* v. *Central of Georgia Ry.*, 170 Fed. 225, 232, 233. Cf. *Cook Brewing Co.* v. *Garber*, 168 Fed. 942, 951. A preliminary injunction in such a case is rightly refused where it would be granted in a suit between private individuals. *Cook Brewing Co.* v. *Garber, supra.* Cf. *New York City* v. *Pine*, 185 U. S. 93, 97; *Southern Counties Gas Co.* v. *City of Long Beach*, 295 Fed. 530, 533; *Water Company of Tonopah* v. *Public Service Commission*, 250 Fed. 304. The delay in carrying out the statute resulting from issuance of a temporary injunction in cases similar to this is an injury to the public interest.[1] Where such a statute is suspended

[1] "The litigation is likely to end sooner if no injunction is in force. Its dispatch is greatly dependent upon the conduct of the case by the complainants. They would not be inclined to press the case for speedy decision when they have once secured a preliminary injunction. As long as it stands, it is as good as any other, and experience shows that it often has practically the effect of a permanent injunction. Knowledge of this fact was probably one of the causes for the enactment of the statute allowing appeals from these interlocutory orders." *Railroad Commission of Alabama* v. *Central of Georgia Ry.*, 170 Fed. 225, 233 (C. C. A. 5).

by preliminary injunction the damage to the public interest cannot readily be appraised, and the public interest cannot be protected by the giving of bond. The equities cannot be balanced, and the *status quo*, so far from being maintained, is destroyed.

MOORMAN, *Circuit Judge*, dissenting in part:

I agree to the setting aside of the injunction, not on the grounds stated in the opinion or concurrence, but for the reason that in my opinion the bill does not state a case for judicial decision. The suit is an attack on the aims and purposes of the Tennessee Valley Authority as expressed in its "power program." Its purpose is to obtain a decree invalidating the program, not as an act or acts done or about to be done, but in its plans and purposes. This tenders an abstract issue only. *Ashwander* v. *Tennessee Valley Authority*, 297 U. S. 288, holds that it is not a justiciable question. I find none in the bill. To spell one out from one or another of its allegations of fact would make it defective for joinder of parties having interests too widely variant. I am of opinion, therefore, that the bill should be dismissed, and I dissent from the holding that it should not.

Plaintiffs-Appellants,

vs.

TENNESSEE VALLEY AUTHORITY, and
ARTHUR E. MORGAN, HARCOURT A. MORGAN and
DAVID E. LILIENTHAL, each individually and as an Executive Officer and Director of Tennessee Valley Authority,

Defendants-Appellees.

On Direct Appeal from the United States District Court
For the Eastern District of Tennessee.

BRIEF FOR APPELLANTS.

John C. Weadock,
Charles C. Trabue,
Charles M. Seymour,
Raymond T. Jackson,
Counsel for Appellants.

D. The Extent, Location and Nature of Appellants' Properties and Businesses 61

E. Review of the Facts Relating to the Method of Disposal of the Water Power After Conversion Into Electricity 65

(1) The execution of the TVA Unified Plan will establish the United States in the electric utility business with a virtual monopoly throughout the State of Tennessee and large parts of eight neighboring States 65

(2) The appellees have adopted and are carrying out a systematic program to take over the markets and businesses of the appellants by direct inducements offered to the consumers of electricity throughout the territory served by appellants 70

(3) TVA has procured the cooperation and assistance of PWA and REA in financing and promoting the TVA Power Program 76

(4) In executing their Power Program, the appellees have contracted to sell and are now offering for sale electric power and electric service at rates far below the actual cost 79

(5) Under the TVA Unified Plan, TVA will regulate its own rates, the rates of distributors of TVA power and all other local intrastate electric rates, including those of appellants 80

(6) The execution of the TVA Unified Plan will supersede the State regulation of local electric rates and service 82

F. The Execution of the TVA Unified Plan Imminently Threatens Each of the Appellants with Irreparable Damage 86

G. The Decision of the Trial Court 89

SPECIFICATION OF ERRORS 92

SUMMARY OF ARGUMENT 94

ARGUMENT.

POINT I. THE WATER POWER BEING CREATED AND TO BE CREATED BY TVA IS NOT BEING, AND WILL NOT BE, CONSTITUTIONALLY CREATED, SO THAT THE FEDERAL GOVERNMENT (TVA) WILL ACQUIRE NO TITLE TO SUCH WATER POWER 94

A. The electricity will not be produced as an incident to the exercise of the power to regulate interstate commerce 95

1. The electricity will not be brought into being as the incidental result of an exercise of the implied power of the Federal Government to improve interstate navigable streams for navigation 96

a. That power development is an independent, if not the primary, purpose of the TVA Act, is plain on the face of the Act 102

b. Considering the TVA Unified Plan as a whole, it is plain that it is a power project and that the water power created is in no sense the incidental result of a navigation improvement on the Tennessee River.... 106

c. In any event the water power created by the tributary reservoirs in the TVA Unified Plan is not incidental to the improvement of navigation..... 111

d. Both the statutory scheme and the administrative plan are plainly attempts, in the guise of exercising the implied power to improve streams for navigation, to exercise power not granted but forbidden to the Federal Government..... 115

e. The trial court failed to find or consider the controlling issue of fact and applied an erroneous principle of law..... 121

2. The creation of the water power may not be sustained under any constitutional power of the Federal Government over flood control.. 122

(a) None of the commercial water power is created by the operation of any flood control structures included in the TVA Unified Plan 123

(b) The creation of water power is the primary purpose of the TVA Unified Plan and flood control is minor, if not pretensive, and any attempt to sustain that plan as a flood control project falls as an attempt to accomplish a forbidden object under the pretense of exercising a constitutional power 124

(c) It is plain on the face of the Act that power development is not incidental to flood control 128

(d) Assuming a determination of the scope of federal power over flood control were involved (which it is not), that power does not extend beyond the power to protect navigation channels and navigation works 128

B. The electricity will not be produced as an incident of the exercise of the war or national defense power 130

POINT II. NEITHER THE STATUTORY NOR THE ADMINISTRATIVE METHOD OF DISPOSING OF THE ELECTRICITY IS WITHIN THE CONSTITUTIONAL POWER OF THE FEDERAL GOVERNMENT AND EACH VIOLATES THE FIFTH, NINTH AND TENTH AMENDMENTS 133

A. The power to dispose of federal property does not include any power of regulation or the power to engage in the conduct or management of a business having no relation to the purposes for which the Federal Government was established; and any such purported exercise of that power is in excess of its scope..... 134

B. In any event the power to dispose of property may not be used for the purpose, or with the direct and necessary effect, of governing con-

cerns reserved to the States and the people or of upsetting the balance of our dual system of government 140

C. The power of the State to authorize and regulate the business of supplying electricity to the public within the States is complete, unqualified, exclusive and inalienable..... 144

D. Under the Ninth Amendment, the people have the right to earn a livelihood, and acquire and use property by engaging in the electric business, subject only to State regulation..... 148

E. To the extent that statutory and administrative methods of disposing of property are constitutional, they are supreme; and consequently in case of conflict between a purported exercise of the power to dispose of property and the reserved powers of the States and the people, and the retained rights of the people, such purported exercise of the federal power must be held unconstitutional or the reserved powers of the States and the people and the retained rights of the people are destroyed..... 151

F. Both the TVA Act and the TVA Unified Plan must be judged by their natural and reasonable effect in the situation in which they operate.... 152

G. The natural, reasonable, intended and inevitable effect of the operation of the method of disposal authorized by the TVA Act and employed in the TVA Unified Plan is to govern matters reserved to the States and to the people, upset the balance of our dual system of government, deprive the people of their rights under the Ninth and Tenth Amendments, and take property in violation of the Fifth Amendment..... 154

1. The TVA Act authorizes, and the TVA Unified Plan establishes, a commercial business of such size and nature as necessarily to destroy the powers reserved to the States and the people, and the retained rights of the people, in all of Tennessee and large parts of six or more other States 154

2. The TVA Act, as a purported exercise of federal power, authorizes TVA to exercise, and under the TVA Unified Plan, TVA is exercising, the authority to engage in the business of supplying electricity to the public within the States 159

3. The TVA Act authorizes TVA to regulate, and under the TVA Unified Plan, TVA is exercising the power to regulate, its own rates and service, the rates and service of distributors of TVA power and the rates of privately owned and State regulated utilities operating in the area..... 163

4. The TVA Act establishes, and TVA under the Unified Plan is carrying out, a policy of having the local electric business carried on by public bodies or non-profit organizations 175

5. There is no real or substantial relation between the power to dispose of federal property and the regulation of local electric rates or the establishment within the States of a federal policy of having the local electric business carried on by public or non-profit organizations 178

6. The natural and reasonable effect of the operation of the Act, by bringing about a Federal monopoly of the local electric business, is to deprive the States of important tax revenues 178

H. The objection that the statutory and administrative scheme for the disposal of the electricity is unauthorized by the Constitution and contravenes the Fifth, Ninth and Tenth Amendments cannot be cured by the consent of a State; and were the question one of release from inherent constitutional limitations, they could not be surrendered in the vital characteristics here involved except by constitutional amendment.... 180

I. The principles laid down in the Ashwander Case condemn the method of disposal authorized by the Act and adopted by the TVA Unified Plan.. 187

POINT III. THE RIGHT OF APPELLANTS TO SUE, IN THE SITUATION SHOWN ON THIS RECORD, IS PLAIN 191

A. One threatened with direct and special injury through the application of a federal statute or the act of a federal officer may maintain a suit to determine whether the statute is constitutional or the act is authorized..... 194

B. The legal rights of appellants which are invaded or threatened with immediate invasion..... 195

C. The right of appellants to sue to enjoin actual and threatened illegal competition is clear..... 197

(1) The right to be free from illegal competition includes competition for future or unattached business 199

(2) The right to be free from illegal competition includes competition for business handled by TVA through municipal and cooperative distributors 201

(3) While the existence of such a relationship is not an essential of appellants' right to sue, the municipalities and cooperatives are in reality mere agents for the distribution of TVA power; and in any event, TVA so far controls and participates in the sales by distributors that the validity of its participation may be tested at the suit of an injured party 204

D. There is a clear right in appellants to sue to vindicate their right to engage in and carry on the local electric business free from federal interference, regulation or control and without being displaced by the Federal Government taking over the business..... 210

E. The right of appellants to sue is clear under the decision of this Court in Alabama Power Co. v. Ickes 211

POINT IV. UNLESS, AS WE BELIEVE, APPELLANTS ARE ENTITLED ON THE RECORD AS MADE TO A REVERSAL OF THE DECREE WITH DIRECTIONS TO ISSUE AN INJUNCTION, THEN THE DECREE OF THE TRIAL COURT SHOULD BE REVERSED FOR SERIOUS ERRORS IN MATTERS OF PROCEDURE AND IN RULINGS ON EVIDENCE... 214

A. The trial court applied generally certain erroneous principles of law which permeated the entire trial and its rulings on matters of evidence and procedure 214

1. Before questions of constitutional law, both novel and of far-reaching importance, are passed upon, the facts essential to their decision should be definitely found by the trial court upon adequate evidence..... 216

B. The trial court erred in excluding evidence which was relevant and material to substantial issues of fact sought to be proved by appellants in support of their affirmative case on the merits 219

1. The trial court erred in excluding competent evidence bearing upon the question whether the water power being created or to be created by TVA is being, and will be, constitutionally created (See Point I, *supra*)..... 226

2. The trial court erred in excluding competent evidence bearing on the issue whether the statutory and administrative method of disposing of the electricity is within the constitutional power of the Federal Government or violates the Fifth, Ninth and Tenth Amendments (See Point II, *supra*)..... 228

a. Evidence supporting the charge that the execution of the TVA Unified Plan will establish the United States in the electric utility business with a virtual monopoly throughout the State of Tennessee and large parts of eight neighboring States.. 228

b. Evidence supporting the charge that the appellees have adopted and are carrying out a concerted program to take over the

markets and businesses of the appellants by direct inducements offered to consumers of electricity throughout the territory served by appellants..... 229

c. Evidence supporting the charge that PWA and REA have cooperated and are continuing to cooperate with TVA in financing and promoting the TVA power program and in establishing and placing in operation the purposes of the TVA Act 233

d. Evidence supporting the charge that the appellees have contracted to sell and are now offering for sale electric power and electric service at rates far below the actual cost, and that the inevitable effect of the operation of the TVA Unified Plan will be to regulate the rates of appellants 236

e. Evidence supporting the charge that the execution of the TVA Unified Plan imminently threatens each of the appellants with irreparable damage..... 237

C. The trial court erred in its rulings on matters of practice and procedure during the conduct of the trial with the effect of denying appellants the opportunity to present their case fully and fairly 238

1. The refusal to authorize the issuance of subpoenas duces tecum..... 238

2. The refusal to limit the scope of cross examination to the subjects of direct examination and the limitation of the cross examination of appellees' witnesses by appellants in other respects 241

3. The limitation of the scope of rebuttal..... 243

CONCLUSION 247

TABLE OF AUTHORITIES.

Cases.

OCTOBER TERM, 1938.

No. 27.

THE TENNESSEE ELECTRIC POWER COMPANY, *et al.*,
Plaintiffs-Appellants,

vs.

TENNESSEE VALLEY AUTHORITY, *et al.*,
Defendants-Appellees.

ON DIRECT APPEAL FROM THE UNITED STATES DISTRICT COURT FOR THE EASTERN DISTRICT OF TENNESSEE.

BRIEF FOR APPELLANTS.

This is a direct appeal from a final decree entered by the United States District Court for the Eastern District of Tennessee, after a hearing on the merits, dismissing a Bill brought by appellants to enjoin the appellees, Tennessee Valley Authority[1] and its directors, from generating, transmitting and distributing electricity for sale in competition with appellants upon the ground that the Tennessee Valley Authority Act[1] (Acts of Congress, May 18, 1933, and August 31, 1935, 48 Stat. 58, 49 Stat. 1075, 16 U. S. C. 831, *et seq.*), under color of which the appellees are proceeding, either does not authorize such acts or is to that extent unconstitutional.

[1] The Tennessee Valley Authority and the Tennessee Valley Authority Act are hereinafter sometimes referred to respectively as TVA and the TVA Act.

OPINIONS BELOW.

The opinion of the District Court for the Eastern District of Tennessee is reported in 21 F. Supp. 947, and appears in the record at R. 542. An opinion by the United States Court of Appeals for the Sixth Circuit on an appeal from an order granting a preliminary injunction in this cause is reported in 90 F. (2d) 885 and appears in the record at R. 267. Three unreported opinions of the District Court overruling appellees' motion to quash service of subpoena and dismiss the bill of complaint, overruling appellees' motion to dismiss the bill for insufficiency and multifariousness, and granting appellants' application for a preliminary injunction, appear at R. 141, 158 and 260, respectively.

JURISDICTION.

A statement of the grounds on which jurisdiction of this Court is invoked has been separately filed in accordance with Paragraph 1 of Rule 12 of this Court. On May 16, 1938, this Court entered an order noting probable jurisdiction.

QUESTIONS PRESENTED.

The case presents the question of the constitutionality of the TVA Act in whole and in each of its several parts, or, if the Act be valid, then the validity of the administration thereof, in whole or in part, by those assuming to act thereunder in the particulars involved. The specific questions are:

1. Whether the electricity being generated and to be generated by TVA is being or will be constitutionally produced so that the Federal Government or its agency (TVA) acquires or will acquire any title to such electricity as incidentally produced.—

(a) in the exercise of the power of the Federal Government to regulate interstate commerce, or

(b) in the exercise of the war power.

2. Whether, assuming the electricity is being, and will be, constitutionally acquired by TVA under the TVA Act, the statutory and administrative methods of disposing of the property are an unconstitutional exercise of the power to dispose of property

(a) as in excess of the scope of that power, or

(b) in violation of the Fifth, Ninth and Tenth Amendments and contrary to our dual system of government.

3. Whether the appellants have a standing to sue to test the legality and constitutionality of the acts of the appellees done or threatened to be done either under the color or outside the terms of the TVA Act.

4. Whether, unless the appellants are entitled, on the record as made, to a reversal of the decree with directions to grant the relief prayed for, the appellants, nevertheless, are not entitled to a reversal of the decree because of prejudicial errors of the trial court in matters of procedure and in rulings on evidence amounting to a denial of due process of law to appellants.

STATUTE INVOLVED.

This suit involves the interpretation and constitutionality of the TVA Act, as amended. (Act of Congress of May 18, 1933; amended by the Act of Congress of August 31, 1935; 48 Stat. 58; 49 Stat. 1075; 16 U. S. C. 831, *et seq.*) The TVA Act and the material parts of other statutes, State and federal, cited in this brief or cited by the trial court as bearing on the case, are printed in the separate appendix to this brief.

STATEMENT OF THE CASE.

A. THE PARTIES AND THE PROCEEDINGS BELOW.

The appellants are sixteen corporations [1] respectively engaged in the business of supplying electricity to the public in the area in which TVA is supplying, offering to supply, or preparing and imminently threatening to supply, electric power to the public. (See pp. 61-64, *infra.*) The appellees are the Tennessee Valley Authority, a corporation created under the Act of Congress known as the TVA Act, and the three individuals who constitute its Board of Directors.

The suit was originally filed in the Chancery Court of Knox County, Tennessee, on May 29, 1936 (R. 1), and the case was thereafter duly removed at the instance of the appellees to the District Court of the United States for the Eastern District of Tennessee. The District Court on October 19, 1936, entered an order overruling a motion of the appellees to quash service of process and to dismiss the bill for want of jurisdiction. (R. 155.) On November 12, 1936, the District Court also entered an order overruling appellees' motion to dismiss the bill on the grounds that the bill stated no case or controversy and was multi-

---

[1] Originally the Georgia Power Company, Tennessee Public Service Company and Holston River Electric Company were also parties complainant. The Georgia Power Company was subsequently enjoined from further participation in this suit upon the ground that a prior suit, involving the same issues, was still pending and undetermined in a Federal District Court in Georgia (*Georgia Power Co. v. Tennessee Valley Authority*, 17 F. Supp. 769, affirmed 89 F. (2d) 218, certiorari denied 302 U. S. 692); and said Company was subsequently dismissed without prejudice as a party to the instant suit. (R. 582.) Since this appeal was taken, Tennessee Public Service Company and Holston River Electric Company have turned over their electric facilities to TVA and its nominee, the City of Knoxville; and subsequently this Court entered an order permitting these companies to withdraw as parties to this suit and to this appeal without prejudice to the rights of the remaining appellants.

farious. (R. 159.) On December 22, 1936, the District Court entered an order granting the preliminary injunction which had been prayed for by appellants. On the same day the appellees took an appeal from the decree of preliminary injunction to the United States Circuit Court of Appeals for the Sixth Circuit, which, on May 14, 1937, rendered an opinion holding that the interlocutory injunction should be dissolved, that the Bill states a justiciable case or controversy, that the Bill is not multifarious, that the District Court has jurisdiction and that the case should be remanded for trial on the merits. (R. 267.) A decree was entered accordingly. (R. 285.) The appellees applied to this Court for a writ of certiorari to review this decree of the Court of Appeals on the ground that the Court of Appeals should have directed the dismissal of the Bill instead of remanding the case for trial on the merits. The application for certiorari was denied. (301 U. S. 710.)

Thereafter, and before the cause came on for trial, the Act of Congress of August 24, 1937, was passed, providing for a special three-judge court to hear and determine cases brought to enjoin, as unconstitutional, the execution of a federal statute. (50 Stat. 751, 752, Sec. 3; 28 U. S. C. 380a.) Pursuant to this statute a three-judge court was convened as the United States District Court for the Eastern District of Tennessee to hear the cause.[1] After a hearing on the merits, which was concluded on January 15, 1938, the three-judge court on January 25, 1938, entered the decree dismissing the Bill. (R. 573.) This appeal from that decree is taken directly to this Court under the Act of Congress of August 24, 1937. (50 Stat. 751, 752, Sec. 3; 28 U. S. C. 380a.)

---

[1] Honorable Florence E. Allen, Circuit Judge, and Honorable John D. Martin, District Judge, were designated to participate with Honorable John J. Gore, District Judge, in hearing the cause. (R. 357.)

B. THE NATURE, PURPOSE AND SCOPE OF THE STATUTE AND THE CURRENT STAGE OF ITS EXECUTION.

(1) Background of the Tennessee Valley Authority Act.

An examination of the background upon which the TVA Act was passed shows that TVA is a federal corporation created by Congress to develop the power resources of the Tennessee River and its tributaries as a federal enterprise. In 1925, the Congress directed the Secretary of War, through the Corps of Engineers of the United States Army, and the Federal Power Commission to prepare and submit to Congress estimates of the cost of making surveys of the navigable streams of the United States and their tributaries with a view to formulating general plans for the most effective improvement of such streams for the federal purpose of navigation in combination with the most efficient development of the non-federal uses of such streams, such as water power, flood control and irrigation. (Act of Congress of March 3, 1925; 43 Stat. 1186, 1190, App. p. 35.) The manifest purpose of these surveys was to inform Congress as to the relative value of the streams for federal use, that is, navigation, and for non-federal uses, such as water power, irrigation and municipal water supply, so that Congress might exercise its paramount power over the streams for purposes of navigation in recognition of and with due regard for local non-federal uses, frequently more valuable.

In a report made pursuant to the Act of March 3, 1925, and published as House Document 308, 69th Congress, 1st Session (1926), the Corps of Engineers outlined a plan for surveys of practically all of the navigable streams of the United States and their tributaries (including the Tennessee River and its tributaries) to appraise the value of their federal and non-federal uses, and the surveys outlined in that document were authorized by the Act of Congress of January 21, 1927. (44 Stat. 1010, 1015.

App. p. 35.) All reports subsequently made under this authority are commonly known as "308 Reports."

The survey for the Tennessee River and its tributaries was transmitted to Congress on May 15, 1930, and published as House Document 328, 71st Congress, 2nd Session. (Comp. Ex. 105[2], p. 1.) This "308 Report," as required by the Act of Congress, examined both the federal and non-federal potential uses of the Tennessee River and its tributaries. The Chief of Engineers reported that the proper method of improving the Tennessee River for 9-foot navigation would be by the construction of 32 low-lift dams at a cost of $56,000,000 with locks 56 x 360 feet, or at a cost of approximately $75,000,000 with locks 110 x 600 feet. Such a channel with the larger locks would conform to the standards upon which the Mississippi River and its principal tributaries had been and were being improved for navigation. (Comp. Ex. 105[2], p. 4, par. 16; p. 97, par. 78; p. 100, par. 79; Add. Fdg. 3, R. 671.) *The improvement of the river for navigation alone would not have produced any commercial power but only sufficient power to operate the locks.* (Putnam R. 1155; Comp. Ex. 346*; Comp. Ex. 105[2], p. 100, par. 79, Add. Fdg. 19, R. 674.)

The Chief of Engineers pointed out that the District Engineer "as required by law" had shown "the ultimate use that may be made of the waters of the Tennessee Basin by the United States *and its citizens*," or, in other words, the sum of the values of the potential federal and non-federal uses of the river and its tributaries. (Comp. Ex. 105[2], p. 2, par. 8.) This ultimate use that might be made of the Tennessee River and its tributaries "by the United States *and its citizens*" included, as disclosed by the report, the ultimate development *by the citizens of the United States* of the river and its tributaries *for power* and the improvement of the river and some of its tributaries by the United States for navigation.

The report on the power resources, as distinguished from the navigation resources, of the Tennessee River and its tributaries showed that their maximum development would provide approximately 5,000,000 kilowatts of firm (i.e. dependable) capacity and would produce 25,000,000,000 kilowatt-hours of firm energy annually and that the cost of developing these power resources and providing in connection therewith the facilities necessary to provide or preserve 9-foot navigation[1] would be approximately $1,200,000,000. (Add. Fdg. 5, R. 672; Comp. Ex. 105°, p. 3, par. 10; p. 2, par. 8; p. 88, par. 67.)

The District Engineer regarded the cost of the low dams necessary to improve the river for navigation "as a measure of the benefits to navigation which are secured by the construction of the high dams and locks," (Comp. Ex. 105°, p. 5, par. 16) or, in other words, by the development of the power resources of the river with provision for the facilities necessary under such circumstances for navigation and without which navigation would be completely obstructed by the power development. The District Engineer then recommended "the adoption of the project for the improvement of the Tennessee River to Knoxville by low dams with locks of Ohio River standards * * * at an estimated cost of $74,709,000 * * *, provided that *under the provisions of the Federal water power Act* a high dam may be substituted for any two or more of the proposed low dams if the resulting cost to the United States will thereby be reduced *and the navigable capacity of the*

---

[1] The development of the power resources involves the construction of high power dams; and, of course, unless navigation facilities such as locks, proper entrance channels and proper protection against currents produced by power operations were provided, these power projects would completely obstruct navigation on the river except such as might be carried on locally within each power pool.

waterway will not be lessened." (Comp. Ex. 105°, p. 5, par. 17.)

The controlling recommendation of the Chief of Engineers was:

> "that the adopted project by the United States for the improvement of the Tennessee River from its mouth to Knoxville be for a navigable depth of 9 feet at low water by low dams in the number and approximate location as set forth in the report of the district engineer: *Provided,* That under the provisions of the *Federal water power act* a high dam with locks may be substituted for any two or more of the low dams and *built by private interests, States, or municipalities: And provided further,* That in case high dams are built before the United States shall have built the projected locks and low dams which are to be replaced, the United States shall contribute to the cost of the substituted structures an amount equal to the estimated cost of the works of navigation for which substitution is made." (Comp. Ex. 105°, pp. 6-7, par. 23.)[1]

The Congress adopted the project for the improvement of navigation on the Tennessee River as thus recommended by the Chief of Engineers. (Act of Congress of July 3, 1930, 46 Stat. 918, 927-8, App. p. 36; Add. Fdg. 3, R. 671.) This is now, and at all times since, has been, the adopted Federal Navigation Project for the improvement of the Tennessee River. (Annual Report of Chief of Engineers, 1932, Part 1, Comp. Ex. 106†, pp. 1206-8, R. 2617; Annual Report of Chief of Engineers, 1936, Part 1, Comp. Ex. 107†, pp. 1032-4; R. 2619-20A.)

Private interests had acquired or were in the process of acquiring most of the sites for high power dams on the Tennessee River and many of its tributaries. (Add. Fdg. 5, R. 672; Barry R. 871; Kurtz R. 1231-2, 1217-8, 1228-9;

---

[1] Unless otherwise noted, throughout this brief the emphasis has been supplied.

Watkins R. 1540-1, 1558.) However, because of the depression, the absence of a market for the power or the economic unsoundness of the construction of such high power dams on the Tennessee River, private interests, municipalities and States did not, prior to May, 1933, undertake the construction of any high power dams on the Tennessee River under the provisions of the Federal Water Power Act and the Act of Congress of July 3, 1930. (Add. Fdg. 5, R. 671.)

In this situation and on May 18, 1933, Congress passed the TVA Act which created a federal corporation to engage in the development of the power resources of the Tennessee River and its tributaries and the transmission and sale of such power just as those resources might have been developed by private power companies, municipalities or States under the terms of the Federal Water Power Act and the Act of Congress of July 3, 1930. As will hereafter more particularly appear, the Tennessee Valley Authority, a corporation, stands in the same relation to the Federal Navigation Project on the Tennessee River that private corporations, States and municipalities stand in cases where they make power developments on navigable streams under the Federal Water Power Act and where they would have stood if they had made these same power developments on the Tennessee River and its tributaries.

(2) The general purposes and pertinent features of the Tennessee Valley Authority Act.

(a) The relation, if any, of the TVA Act[1] to the improvement of navigation is at most incidental to power development. The TVA Act provides for the complete development of all of the power resources of the Tennessee River and its tributaries and merely acknowledges that

---

[1] The TVA Act and the pertinent provisions of the Federal Power Act are printed in the Appendix to this brief.

such development must be in subordination to the paramount rights of navigation,—that is, the statute provides that TVA may develop all of the power resources of the Tennessee River and its tributaries upon exactly the same terms and conditions with reference to dominance of navigation that the Federal Power Act imposes upon a private company that undertakes to develop power resources on a navigable stream. (Barker R. 1992, 2016-7; Bowman R. 2249-51; Add. Fdg. 23, R. 675.) Thus, under the Federal Power Act the private licensee must "maintain the project works in a condition of repair adequate for the purposes of navigation" and "shall so maintain and operate said works as not to impair navigation." (16 U. S. C. 803(c).) A licensee under the Federal Power Act is required to construct, in connection with his power project, "structures for navigation purposes, in accordance with plans and specifications approved by the Chief of Engineers and the Secretary of War" (16 U. S. C. 804(a)); and the operation of such a licensed project "shall at all times be controlled by such reasonable rules and regulations in the interest of navigation, including the control of the level of the pool caused by such dam or diversion structure as may be made from time to time by the Secretary of War." (16 U. S. C. 811.) Control of navigation facilities incidentally provided in connection with a power development *is vested in the War Department*, both under the Federal Power Act and under the TVA Act, and both the private licensee and TVA are obligated to supply without charge the power necessary for the operation of navigation facilities *as directed by the War Department*. (Federal Power Act, 16 U. S. C. 804(c), 811; TVA Act, Secs. 7(a), 5(k).) Like the Federal Power Act, the TVA Act is found in the Title of the Federal Code devoted to Conservation (Title 16) and not in the Title devoted to Navigation. (Title 33.)

(b) The TVA Act, in express terms, turns over the entire power resources of the Tennessee River and its tributaries[1] to a federal corporation for development as the basis for the creation of a great unitary federally-owned and operated electric power system. The power resources of the Tennessee River system, plus steam generating plants authorized to be constructed or acquired under the Act, are to constitute the generating facilities around which the ultimate electric system is to be constructed. Thus the Act provides:

1. That TVA may condemn lands for the construction of "dams, reservoirs, transmission lines, power houses and other structures * * * *at any point along the Tennessee River or any of its tributaries*" (Sec. 4 (i)), and that no one else may develop any power resources of the Tennessee River or its tributaries without the consent of TVA. (Sec. 26a.)
2. That TVA "shall have power to acquire or construct *power houses, power structures, transmission lines*, navigation projects and incidental works in the Tennessee River and its tributaries, and *to unite the various power installations into one or more systems by transmission lines.*" (Sec. 4 (j).)
3. That TVA "in the construction of any future *dam, steam plant, or other facility*, to be used *in whole or in part* for the *generation or transmission of electric power*," may issue or sell on the credit of the United States serial bonds not exceeding $50,000,000. (Sec. 15.)

---

[1] The survey of the power resources of the Tennessee River and its tributaries made by the Army Engineers had disclosed to Congress that their maximum development would produce a firm or dependable capacity of 5,000,000 kilowatts and an annual output of 25,000,000,000 kilowatt-hours. (Comp. Ex. 105, pp. 3, 88, pars. 10, 67; Add. Fdg. 5, R. 672.)

4. That the Cove Creek (Norris) project, "together with a transmission line from Muscle Shoals" should be constructed "according to the latest and most approved designs, including power house and hydroelectric installations and equipment for the generation of power, in order that the waters of the said Clinch River may be impounded and stored above said dam for the purpose of increasing and regulating the flow of the Clinch River and the Tennessee River below, *so that the maximum amount of primary power* may be developed at Dam Numbered 2 (Wilson) and *at any and all other dams* below the said Cove Creek Dam." (Sec. 17.)
5. That the President shall recommend legislation to accomplish, among other things, "*the maximum generation of electric power* consistent with flood control and navigation." (Sec. 23.)
6. That TVA may retain out of the proceeds of its power sales, such part as "in the opinion of the board shall be necessary for the Corporation * * * in conducting *its business in generating, transmitting and distributing electric energy*" (Sec. 26.)
7. That TVA shall in any event retain a continuing fund of $1,000,000 to defray emergency expenses and to insure continuous operation of the power business. (Sec. 26.)
8. That TVA may "produce, distribute, and sell electric power as herein particularly specified." (Sec. 5(1).)
9. That TVA may sell the power on long-term contracts ranging from 20 to 30 years. (Secs. 10, 12.)
10. That TVA may, out of funds appropriated by Congress, funds derived from the sale of power, or funds secured by the sale of bonds, "construct, lease, purchase, or authorize the construction of *transmission lines within transmission distance from the place where generated*,

and to interconnect with *other systems.*" (Sec. 12.)

11. That TVA may enter into contracts "*with other power systems*" for the exchange of power. (Sec. 12.)

12. That TVA shall have no control over the locks, i.e. the navigation facilities (Sec. 7(a)), and that upon requisition of the Secretary of War, TVA shall supply power without charge for use in operation of navigation facilities (Sec. 5(k)), as in the case of a private power development under the Federal Power Act.

The foregoing makes plain that under the statute the development of the power resources of the Tennessee River and its tributaries is not merely incidental to navigation improvement, but that the development of such power is at least an independent and separate, if not the paramount, objective of the statute. The TVA power project, like the power project of any private power company, need only be "consistent" with—that is, not unreasonably obstructive to—navigation and flood control, in so far as the latter comes within the field of federal power. Consistently with the statutory purpose to create a federal agency for power development, the TVA directors were forbidden to have a financial interest in a public utility corporation but were not forbidden to have a financial interest in a commercial barge line. (Sec. 2(f).)

(c) The statute affirmatively and in detail provides for the regulation of matters of intrastate concern, that is, the regulation of local electric rates, services and practices, and for the establishment of a policy of having the local electric business carried on by public bodies or nonprofit organizations. An examination of the Act discloses:

1. That the TVA in selling electricity "shall give preference to States, counties, municipalities and

cooperative organizations * * * *not organized or doing business for profit.*" (Sec. 10.)

2. That all contracts for sale of power to private companies or individuals, reselling such power for profit, shall contain a cancellation clause so that TVA may recapture the power for use in promoting the statutory policy of having the local electric business in the several States carried on by public bodies or non-profit organizations. (Sec. 10.)

3. That further to favor the policy of placing the local electric business in the hands of public bodies or non-profit organizations, TVA may enter into contracts for 30 years with such organizations, provided they will build transmission lines to TVA generating stations or transmission lines. (Sec. 12.)

4. That to forward such policy, TVA may extend credit for a period not exceeding five years to such public bodies and non-profit organizations situated within transmission distance from any TVA generating station to acquire and operate existing distribution facilities and incidental works, *including generating plants* and interconnecting transmission lines (Sec. 12a), and that for this purpose TVA is authorized to issue bonds in the amount of $50,000,000 upon the credit of the United States. (Sec. 15a.)

5. That TVA may "construct transmission lines to farms and small villages that are not otherwise supplied with electricity *at reasonable rates.*" (Sec. 10.)

6. That TVA may "make such rules and regulations governing such sale and distribution of such electric power as in its judgment may be just and equitable." (Sec. 10.)

7. That TVA may "include in any contract for the sale of power *such terms and conditions, including resale rate schedules,*" and "provide for such

rules and regulations as in its judgment may be necessary or desirable for carrying out the purposes of this Act." (Sec. 10.)

8. That TVA may provide that any contract shall be voidable at its election in case the purchaser fails to comply with any terms, rules or regulations prescribed by TVA. (Sec. 10.)
9. That TVA "shall have power to acquire existing electric facilities used in serving such farms and small villages." (Sec. 10.)
10. That the power shall be sold at rates which will establish a policy in the several states of favoring domestic and rural use over industrial use. (Sec. 11.)
11. That the power shall be sold to domestic and rural consumers "at the lowest possible rates." (Sec. 11.)
12. That all contracts for sale of TVA power to public bodies or cooperative organizations "shall provide that the electric power shall be sold and distributed to the ultimate consumer without discrimination." (Sec. 12.)
13. That TVA shall require in all contracts for sale of power to corporations or persons doing business for profit that such power shall be resold "*at prices that shall not exceed a schedule fixed by the board from time to time as reasonable, just and fair.*" (Sec. 12.)
14. That the statute provides for no hearing, appeal or review in connection with the fixing of any rates or other regulations of the local electric business.
15. That TVA shall fix its own rates (Sec. 14) and hence shall be free from State regulation.

The plain effect of the foregoing provisions is: that TVA may extend its electric business to any and all localities in the several States within transmission distance of its unitary grid system or power pool, without securing

any State or local franchise or complying with State law; that having taken over the public duty of supplying electric service to any or all localities in the various States within transmission distance of this power pool, it may discontinue such service without State approval or consent; and that the establishment within the States of these federal policies in relation to the local electric business is made certain and complete through the production and sale of an amount of electricity unlimited in relation to the available market (see pp. 65-69, *infra*) with numerous statutory subsidies provided at the expense of federal and State taxpayers so that privately owned and state-regulated utilities cannot compete. Many of the foregoing statutory provisions also are designed to promote the establishment, growth and expansion of the TVA power business.

(3) The steps taken and immediately threatened in the execution of the TVA Act and in the current TVA construction program known as the TVA Unified Plan.

Since its organization in 1933, TVA has been engaged in building the high dams essential for power production on the Tennessee River with incidental navigation facilities and in building high power dams and reservoirs on certain of its tributaries with no navigation facilities whatever. (Def. Ex. 153†, pp. 919, 970-977; Fdgs. 29-38, 40, 171, R. 600-4, 638; Add. Fdg. 18, R. 674.) *The TVA program of construction* of dams and hydro-electric plants on the Tennessee River and its tributaries has steadily and rapidly expanded from year to year since the organization of TVA until the present time when, *known as the TVA Unified Plan,* it includes seven high power dams and hydro-electric developments on the Tennessee River, designated as Gilbertsville, Pickwick Landing, Wheeler, Guntersville, Chickamauga, Watts Bar and Coulter Shoals, and

three high power dams and reservoirs on tributaries, designated as Norris on the Clinch River, Hiwassee on the Hiwassee River, and Fontana on the Little Tennessee River. (Comp. Ex. 328°, p. 20; Comp. Exs. 327*, 343*, 354*; see also Fdgs. 29-40, R. 600-4; Add. Fdgs. 8, 33, 107, R. 673, 677, 700.)[1] This is still the current construction program of the TVA as disclosed by the latest hearings before a committee of the Congress in December, 1937. (Def. Ex. 153†, pp. 948, 919.) The TVA Unified Plan also includes increasing the height of Wilson Dam (Comp. Ex. 328°, p. 25), which was built under the National Defense Act of June 3, 1916, (39 Stat. 166, 215), and completed in 1925.

The dams and hydro-electric projects already completed by TVA are Norris on the Clinch River and Wheeler on the Tennessee River. (Fdgs. 29, 30, 171, R. 600, 638.) The Pickwick Landing, Guntersville and Chickamauga projects on the Tennessee River and the Hiwassee project on the Hiwassee River are in process of construction. (Fdgs. 31-34, R. 601-2.) Schedules for the construction of the other projects have been reported to the Congress. (Comp. Ex. 328°, p. 27; Def. Ex. 153†, pp. 948, 977.) TVA has also requested funds to explore other tributaries for the purpose of discovering suitable sites and foundation conditions for the construction of additional hydro-electric developments on the tributaries. (Comp. Ex. 328°, p. 23; Comp. Ex. 108†, p. 25, R. 2621; Comp. Ex. 116†, p. 414; Kimball, R. 1852.)

The history of TVA activities shows that the present construction program of TVA is only a stage in the de-

---

[1] The steady and rapid growth of the TVA construction program is vividly shown by the successive Congressional Hearings on TVA Appropriations (Comp. Exs. 108†, p. 23, R. 2621; 109†, pp. 137, 139-40, R. 2623-5; 112†, p. 287, R. 2680; 114†, p. 635, R. 2690; 115†, p. 279, R. 2696; 116†, p. 403, R. 2700A; Def. Ex. 153†, p. 948), the TVA Appropriation Acts (48 Stat. 274, 1055; 49 Stat. 596, 1607; 50 Stat 217) and the TVA Annual Reports since 1933. (Comp. Ex. 113°.)

velopment which TVA may be expected to continue to expand within the sweep of the statute until it substantially encompasses the development of the entire power resources of the Tennessee River and its tributaries. (See Comp. Ex. 105°, p. 3, par. 10; Add. Fdgs. 107, 112, R. 700-1.) Funds have been regularly provided by Congress on request of appellees as rapidly as the TVA construction program could be feasibly prosecuted. (48 Stat. 274, 1055; 49 Stat. 596, 1607; 50 Stat. 217; Comp. Exs. 108†, 109†, 112†, 114†, 115†, 116†, and Def. Ex. 153†.)

Moreover, TVA is not wholly dependent upon Congressional appropriations for the execution of its construction program, for it may utilize its power to issue bonds in the amount of $50,000,000 to build electric facilities of any kind (TVA Act, Sec. 15) and in the further amount of $50,000,000 to finance the acquisition of municipal and cooperative distribution lines to distribute TVA power (TVA Act, Sec. 15a), and it may utilize its income from its electric business, which it has reported to Congress will reach $23,000,000 a year (Comp. Ex. 115†, p. 279, R. 2697) even with the present TVA schedule of rates which are below subsidized cost. (See pp. 79-80, *infra*.) TVA has advised Congress that it is following the policy of financing its construction work through federal appropriations while holding its bonding power in reserve so that such bonding power, together with income from its power business, will be available for further extensions of its power plant and system when, as and if there should be any insufficiency of funds from the Congressional appropriations to carry out any enlargement or expansion of power facilities desired by TVA. (Dr. A. E. Morgan, Comp. Ex. 109†, pp. 138-9, R. 2624-5.) Thus TVA is becoming increasingly independent, and eventually will become wholly independent, of Congressional appropriations for financing any construction program which it desires to undertake.

All of the foregoing power dams, as well as Wilson Dam, are, or are to be, interconnected by heavy duty transmission lines so as to form a vast grid system or power pool. Thousands of miles of transmission lines will be necessary to distribute the power to be generated. (See pp. 69-70, *infra.*)

The plan provides for power generating machinery with an initial capacity of 697,000 kilowatts and an ultimate capacity of 1,922,000 kilowatts. (Add. Fdg. 7, R. 672; Def. Ex. 153†, p. 919.) For convenience and brevity, the capacity and energy output and the area of existing and threatened TVA power operations are described later in their appropriate relation to the issues in this suit. (See pp. 65-69, *infra.*) The foregoing is merely a brief description of the current construction program of TVA which is hereinafter sometimes referred to generally as the "TVA Unified Plan."

C. REVIEW OF THE FACTS RELATING TO THE CREATION OF THE WATER POWER.

(1) The creation of the water power by TVA is not incidental to the improvement of the Tennessee River for navigation but any improvement of the Tennessee River for navigation is incidental to the creation of water power.

This issue of fact is whether the water power will come into being as the incidental result of building structures which have a real, substantial and *bona fide* relation to the improvement of the Tennessee River for navigation, or whether the water power will come into being, wholly or in part, from the operation of structures deliberately designed and built to create water power.

On this issue of fact, as on others, the majority of the trial court failed or refused to make any findings on essential facts. Such findings as may be interpreted as

in any way apposite are bare conclusions which are not supported by findings of essential underlying facts (*Interstate Circuit v. United States,* 304 U. S. 55) or by the evidence. These conclusions are also based upon an erroneous conception of law as to the constitutional power of the Federal Government to acquire water power or electricity. Many evidentiary findings of the trial court are obviously based on the same erroneous conception of law and are consequently immaterial. Other evidentiary findings find no substantial support in the record, which establishes the contrary beyond dispute, and in some cases are squarely in conflict with the uncontradicted evidence.[1] The following are the essential facts on this issue as established by undisputed evidence or the clear weight of the evidence and in large part found by Judge Gore.

---

[1] The general nature of these Findings and the manner in which they were adopted are described at pp. 91-92, *infra.* In relation to navigation, Fdgs. 47, 52, 53, 70, 74-76, 93, 94 are bare conclusions unsupported by findings of essential underlying facts or by evidence. Fdgs. 39, 42, 44, 46, 47, 52-54, 56, 57, 68-71, 73, 79, 93, 94 are based upon erroneous conceptions of law (pp. 103-104, 121-122, *infra.*) Fdgs. 39, 41, 42, 44, 46, 47, 52-5, 68-76, 79, 93, 94 are unsupported by and contrary to the clear weight of the evidence.

Thus Fdg. No. 41 (R. 604) states that the TVA dams are the same as those described in H. D. 328, 71st Cong. 2nd Sess. (Comp. Ex. 105) which "were designed primarily for navigation and flood control." An examination of that report shows that in so far as the TVA dams correspond in location with, or resemble, any dams discussed in that report, they correspond with and resemble the dams which were there described as essential to a vast scheme for the maximum development of the power resources of the Tennessee River and its tributaries by private interests, States or municipalities at an estimated ultimate cost of $1,200,000,000. They were described in that report only in obedience to the Congressional mandate that "308 Reports" should advise the Congress as to *all* the beneficial uses of the water resources of navigable streams, both federal and non-federal. (See pp. 6-9, *supra.*) The extent to which the foregoing findings are erroneous is set forth in Assignments of Error 68-71, 73, 75, 79. (R. 736-740.)

A comparison of the existing project for the improvement of navigation on the Tennessee River, adopted by the Act of July 3, 1930 (herein referred to as the Federal Navigation Project), for the Tennessee River and the TVA Unified Plan from the standpoint of the physical structures, capacity to carry commerce, integration with our great inland waterway system, power development, cost or economic justification, order of construction and expedition, navigation benefits and all the material characteristics of a Rivers and Harbors project conclusively establish that the TVA Unified Plan is a power project and not a navigation project which incidentally produces some power.[1]

Physical Aspects of Channels. The Federal Navigation Project provided for the creation of a 9-foot channel from Knoxville at the head of the river to its mouth by the construction of some 32 low navigation dams with locks 110 x 600 feet. (Comp. Ex. 105°, pp. 4, 6, pars. 16, 23; Putnam R. 1152-3.) The navigation pools behind these dams would be confined within the natural banks of the stream. This is of great importance in protecting inland water navigation against the hazards of winds and waves. (Putnam [2] R. 1158-9, 1187; Add. Fdg. 37, R. 678.) The lift

---

[1] The purpose of examining the nature of the structures and the characteristics of the project embodied in the TVA Unified Plan is not to ascertain whether a better or more economical navigation project could have been designed, as the trial court surprisingly suggests in its opinion (R. 561), but to ascertain whether the project in the TVA Unified Plan is a navigation project, or a power project. or two separate projects combined in a single scheme, or whether the structures which create the power have any real, substantial or *bona fide* relation to the improvement of navigation.

[2] Major R. W. Putnam, officer of the Corps of Engineers from his graduation from West Point in 1913 until his resignation in 1926, during which period he held, among other positions, that of United States District Engineer for the Chicago District. Since 1926 he has had a wide practice as a consulting engineer on river and harbor work and has also been actively engaged in the commercial navigation business on inland waterways. (R. 1148-51.)

of these locks and dams averages 11.3 feet and their cost averages $2,330,000. (Comp. Ex. 105 B, R. 2616B.) These dams would be of a movable wicket type having navigable passes which would make possible open river navigation for substantial portions of the year. (Add. Fdg. 30, R. 677; Putnam R. 1154.) Under the standard practice of the Corps of Engineers the channel at controlling points would be dredged to an overdepth of three feet so that controlling depths would be twelve feet.[1] (Add. Fdg. 4, R. 671; Putnam R. 1174; Watkins R. 1604-5; Barker R. 2009.) All of the structures in the Federal Navigation Project are appropriate and necessary for navigation. Practically no land lying outside the natural banks would be flooded by the navigation pools.

The structures included in the TVA Unified Plan are very different, and, apart from incidental navigation facilities without which navigation would be completely barred, are neither essential nor useful for navigation. These structures consist of seven high power dams on the Tennessee River and three high power dams on certain tributaries. (See pp. 17-18, *supra*.) The two dams on the Tennessee River below Wilson Dam and Dam No. 1 are being, or are to be, provided with locks 110 x 600 feet; but the five dams on the Tennessee River above Wilson Dam[2] are being, or are to be, provided with locks only 60 x 360 feet. (Fdg. 43, R. 607; Putnam R. 1158.) The maximum lift at the seven dams on the Tennessee River ranges from 45 to 71

---

[1] It is the depth at critical or controlling points, commonly known as "controlling depths," which determines the over-all capacity and usability of an inland waterway.

[2] Both the navigation channel provided by the Federal Navigation Project and the navigation channel which will be incidentally provided in connection with the power project embodied in the TVA Unified Plan utilize Wilson Dam and Dam No. 1, both of which had been previously built by the Federal Government, and Hales Bar Dam which had been previously built by a predecessor of The Tennessee Electric Power Company.

feet with an average of 60 feet and an average normal lift of 55 feet, and the cost of these dams will range from $30,000,000 to $112,000,000 each. (Comp. Ex. 116†, p. 403, R. 2700A; Def. Ex. 153†, p. 919; Putnam R. 1156; Add. Fdg. 33, R. 677.) These dams will have no navigable passes (which are impossible in a high power dam) so that craft would have to lock through at all seasons of the year.

The navigation channel in the Tennessee River which will be incidentally provided in connection with the power project embodied in the TVA Unified Plan will be what is known as a 9-foot channel with over-depths at controlling points of only two feet, and consequently with a controlling depth of only eleven feet. (Bowman R. 2234, 2237; Barker R. 1951.) These high dams will create a series of great artificial lakes, which, as hereinafter pointed out, are dangerous and undesirable for the type of craft which use our inland waterway system. These lakes will extend far beyond the natural banks of the river, will have widths as great as six miles (Fdg. 77, R. 618; Def. Ex. 60*), and will permanently flood 415,700 acres of rich valley land. (Def. Ex. 153†, p. 919.)

Tributary Dams. The Federal Navigation Project includes no tributary dams or reservoirs. The TVA Unified Plan includes three high power dams and reservoirs on three of the tributaries. These dams range in height from 265 to 450 feet. (Comp. Ex. 328°, pp. 25, 95, 100, 104; Def. Ex. 153†, pp. 972, 974; Def. Ex. 49*.) None of them has or will have any navigation facilities. Norris, Hiwassee and Fontana would be obstructions to any possible navigation on the tributaries. (Add. Fdgs. 18, 34, R. 674, 677; Putnam R. 1168.) None of these tributary dams will be of any value to navigation on the Tennessee River on completion of the TVA Unified Plan. (Add. Fdgs. 16, 18, R. 674; Putnam R. 1168-9, 1187-8, Offer to Prove, R. 2309, 2334;

Kelly[1] R. 1375.) The appellees attempted to prove that it would be possible to have through traffic on the Clinch River by means of a coal conveyor to carry coal over Norris Dam from barges above the dam to barges in the river below; but upon their own evidence the trial court found that this would not be practicable or feasible. (Fdg. 80, R. 619; Watkins R. 1622-3; Barker R. 1956-7, 1995-8; Comp. Ex. 933*.) This was apart from the fact that it also appeared that the Clinch River is not practicably navigable in any event. (Barker R. 1998; Comp. Ex. 365†, p. 302.)

The appellees below advanced the fanciful contention that these tributary reservoirs are navigation developments because the release of the stored water during the low water season for the generation of power at the tributary plants and at the main river power plants downstream will incidentally enrich the low water flow of the Tennessee River. *The construction of the Federal Navigation Project or the main river dams of the TVA Unified Plan will result in slack water navigation on the Tennessee River from its mouth to its head at Knoxville.* (Add. Fdg. 16, R. 674; Putnam R. 1155, 1167-9; Kelly R. 1375; Comp. Exs. 105A, 105B, R. 2616A, B; Comp. Ex. 342*.) And the only possible method of improving the Tennessee River for 9-foot navigation is by canalization or slack water navigation. (Barker R. 1943; see also Comp. Ex. 105°, p. 33.) *It is uncontradicted that with slack water navigation the ex-*

---

[1] Colonel Wm. Kelly, President of the Buffalo, Niagara & Eastern Power Corporation; officer in the Corps of Engineers from the time of his graduation from West Point in 1899 until his resignation in 1928, serving as Assistant to the Chief of Engineers, a member of several Commissions studying flood control on the Mississippi River, Chairman of the Board formed to study Mississippi flood control immediately after the great flood of 1927, member of the Board studying the St. Lawrence Waterway, and Chief Engineer for the Federal Power Commission for five years. (R. 1362-6.)

treme low water flow of the Tennessee River is far more than sufficient to supply all of the needs of navigation. Any additional flow will either have no effect or its effect, if any, will be unfavorable to navigation. (Add. Fdg. 16, R. 674; Putnam R. 1155, 1167-9, 1188, Offer to Prove, R. 2309-10, 2333-4; Kelly R. 1375; Woodward R. 1796-7.) It is also clear that there is no benefit to navigation from enrichment of low water flow in the Mississippi River (Putnam R. 1168, Offer to Prove, R. 2309-10, 2331, 2333-4; Knappen, Offer to Prove, R. 2355-6); and moreover TVA is not charged with any duty or granted any authority in relation to navigation on the Mississippi River under the TVA Act.

Integration with Mississippi Inland Waterway System. The Federal Navigation Project provides a waterway fully integrated with, and in every way adapted to incorporation in, the great inland waterway system of the Mississippi River and its principal tributaries, which system is uniformly based on a 9-foot channel (with usual over-depths at controlling points) and standard locks 110 x 600 feet. (Add. Fdg. 3, R. 671; Putnam R. 1169; Barker R. 2009; Comp. Ex. 105°, p. 100, par. 79.) The navigation facilities which will be incidentally provided in connection with the power project embodied in the TVA Unified Plan are not integrated with that system because their controlling depths are a foot less, because five of its seven locks are scarcely more than half standard size for the Mississippi system and because the wide waters in the lakes created by the TVA power dams require a different type of transportation equipment than that commonly used on the Ohio and Mississippi Rivers. (Add. Fdg. 22, R. 675; Putnam R. 1169, Offer to Prove, R. 2304-6; Willson R. 1393.)

Capacity for Carrying Commerce. The capacity of the Federal Navigation Project is substantially greater than that of the navigation facilities which would be incidentally provided in connection with the power project

embodied in the TVA Unified Plan (Add. Fdgs. 26-29, 35, R. 675-7; Putnam R. 1153-4, 1157-8), even with no allowance for the fact that during a substantial and important part of the year (which would be as great as 67 per cent of the time in the lower river) there would be open river navigation and, therefore, practically unlimited capacity in the Federal Navigation Project. (Add. Fdg. 30, R. 677; Putnam R. 1154; Barker R. 2004.)

Power Production. The Federal Navigation Project would produce no power except a small amount for the operation of navigation facilities. It would produce no commercial power. (Add. Fdg. 19, R. 674; Putnam R. 1155-6, 1166; Comp. Ex. 105°, p. 100, par. 79; Comp. Ex. 346°.)

On the other hand, the structures in the TVA Unified Plan are precisely the kind of structures which would be built by a private power company for the purpose of developing the maximum amount of power. (Add. Fdg. 75, R. 685; Crane R. 1283-4; Kurtz R. 1218; Bowman R. 1744, 1765.) The maximum development of the power resources of a given stream would be achieved by building a single dam at its mouth high enough to concentrate at that point the entire fall of the stream. Since that is not ordinarily practicable, the greatest practicable development of the power resources of a stream is achieved by developing the entire fall of the stream by the smallest number of high dams that it is practicable to construct. The TVA Unified Plan provides for the construction of the smallest number of high dams with which it is practicable to develop the entire fall of the Tennessee River (Add. Fdg. 76, R. 685; Bowman R. 1764-5), and in addition provides a vast amount of power storage on the tributaries which greatly increases the firm capacity of the system.

In an extreme low water year the TVA Unified Plan will have (over and above the capacity of Wilson Dam before it was incorporated in the TVA power system) 632,000

kilowatts of firm (i.e. dependable) capacity at 100% load factor or 1,072,000 kilowatts of firm capacity at 60% load factor, which is a representative load factor for a large utility in the area in which TVA is carrying on its power business. (Add. Fdgs. 11, 12, 19, R. 673-4; Putnam R. 1158, 1166; Kurtz R. 1211-12, 1215; Comp. Ex. 346*.) It will create a vast quantity of firm and secondary power. (See pp. 66-69, *infra.*) *It is an undisputed fact that five-sixths of this vast quantity of firm power will be created by the three tributary dams and reservoirs.* (Add. Fdg. 11, R. 673; Kurtz[1] R. 1215.) These tributary dams, as before pointed out, are obstructions to any conceivable navigation on the tributaries and of no benefit to navigation on the Tennessee River. (See pp. 24-26, *supra.*)

Comparative Costs. The cost of the Federal Navigation Project would be less than $75,000,000. (Add. Fdg. 31, R. 677; Putnam R. 1155; Barker R. 1993; Comp. Ex. 105°, pp. 7, 100.) If constructed with smaller locks comparable in size to the locks built or to be built at all except two of the TVA power dams on the Tennessee River, the Federal Navigation Project could have been built for about $56,000,000. (Comp. Ex. 105°, p. 4, par. 16.) The TVA Unified Plan will cost approximately $473,000,000, exclusive of Wilson Dam (Add. Fdg. 31, R. 677; Putnam R. 1158; Comp. Ex. 116†, p. 403, R. 2700A; Def. Ex. 153†, p. 919), or approximately $400,000,000 more than the Federal Navigation Project. (Putnam R. 1161; Comp. Ex. 346*.)

---

[1] Ford Kurtz, Chief Hydraulic Engineer, J. G. White Engineering Corporation, for 28 years hydraulic engineer for this Company and intimately connected with the design and construction of some of the largest hydro-electric projects in this country and abroad; acted as consultant on a large number of other projects such as a complete and extensive investigation of the Los Angeles Aqueduct, a $220,000,000 project, flood control dams of Muskingum flood control system, Fort Peck for U. S. Engr. Corps, and storage of flood waters of the Blue Nile in Lake Tsana for the Egyptian, Sudanese and Ethiopian Governments. (R. 1189-1193.)

Moreover, the cost of constructing the TVA Unified Plan exceeds the investment which may be justified for the benefit of navigation by $425,650,000. (Add. Fdg. 43, R. 678; Putnam 1164, 1166; Comp. Ex. 346*.) Indeed, even the cost of the Federal Navigation Project exceeds the justifiable expenditure for navigation by $39,400,000, but under the standard practice of the Corps of Engineers in such cases that project would have been constructed gradually as economic justification developed. (Add. Fdgs. 17, 41, 43, R. 674, 678; Putnam R. 1164, 1166; Comp. Ex. 346*; Kelly R. 1375; Comp. Ex. 105°, p. 7.) This grossly disproportionate expenditure under the TVA Unified Plan is not for the benefit of navigation but for some other purpose. (Add. Fdgs. 15, 21, R. 674-5; Putnam R. 1169, 1185; Kelly R. 1375.) That purpose is the deliberate and independent construction of a power project. (Kurtz R. 1218-19; Crane[1] R. 1283-4.)

Order of Construction and Delay in Providing a Continuous Nine-Foot Channel. The Federal Navigation Project could have been entirely completed between the date of the adoption of the TVA Act and the time of trial at a cost approximately equal to the sum spent by TVA on Wheeler and Norris Dams and power plants so that navigation would now have, and for a considerable time past would have had, the benefit of a continuous navigable channel over the 652 mile length of the Tennessee River fully in-

---

[1] Albert S. Crane, Consulting Engineer, for 39 years engaged in the design and construction of dams and hydro-electric plants and for 15 years Vice President in charge of engineering and construction for J. G. White Engineering Corporation; designed over 38 dams and hydro-electric plants and acted as consultant on between 20 and 30 other large dams; at present consulting engineer on the Mahookey Flood Control Project in New York State and on the Board of Consulting Engineers on Southern New York Flood Control District. (R. 1280-2.)

tegrated with the 9-foot channel in the Ohio and Mississippi Rivers and certain of their important tributaries. (Add. Fdg. 24, R. 675; Woodward R. 1796; Barker R. 1993.) At the time of the trial after almost five years of construction activity and after the expenditure of nearly $200,000,000, TVA had added only 74 miles of 9-foot channel on the Tennessee River. (Fdgs. 40, 77, R. 603, 618.)

The Tennessee River, as above indicated, connects with a 9-foot inland waterway in the Ohio and Mississippi Rivers and certain of their more important tributaries. The two most important centers of industry and commerce in the Tennessee Valley are Knoxville and Chattanooga. In five years TVA has failed to improve the lower 184 miles of the Tennessee River so as to afford an adequate connection with the 9-foot channel in the great inland waterway system of the Mississippi Valley and has likewise failed to provide any practicable navigable channel whatsoever between the two most important commercial and industrial centers in the Tennessee Valley. (Barker R. 1988-90.)

TVA, on the contrary, undertook first the construction of Norris and Wheeler Dams, both of which were the most important from the standpoint of power development, not only by reason of the power developed at those sites, but also by reason of increasing the firm power capacity of Wilson Dam. (Kelly R. 1375; Woodward R. 1815, 1798; Comp. Ex. 909*; Bowman R. 2251.) The operation of Norris Dam also permits the manipulation of the pools of the main river dams for power purposes and daily peaking to meet the utility load curve. (Add. Fdg. 25, R. 675; Barker R. 1994.) TVA next undertook the construction of the Pickwick Landing project below Wilson Dam, which not only provided additional power at its site, but also increased the firm power capacity of Wilson Dam by enabling TVA to escape the restrictions placed by the Army Engineers upon peaking for power purposes at Wilson Dam.

(Bowman R. 1744-5, 1747, 2251; Woodward R. 1813.) Norris and Hiwassee (now under construction) will also increase the firm power capacity of other main stream dams when and if they are constructed.

The sites of the TVA dams are those which would be developed if the primary purpose were to produce as quickly as possible a vast amount of firm power for utility use (Kurtz R. 1218; Crane R. 1283-4; Bowman R. 1744), and the incidental provision of a continuous 9-foot navigation channel has been, and is being, postponed to meet the demands of that power program. Indeed, there is evidence in the record that TVA may not provide the 9-foot channel throughout more than one-fourth of the length of the river *within a period of eight or ten years.* (Barker R. 1993.) Yet generating equipment has already been scheduled for installation *within the next three years,* sufficient to serve a utility load of 570,000 kilowatts. (Def. Exs. 140, 141, R. 4187, 4188.)

Claimed Advantages of TVA Navigation Facilities are Non-existent or Negligible and are More than Offset by Disadvantages. The facts reviewed show that *in all of the substantial and important characteristics of an inland waterway,* the Federal Navigation Project is definitely superior to the navigation facilities which will be incidentally provided in connection with the power project of the TVA Unified Plan. The appellees have claimed trifling advantages for the incidental TVA navigation facilities in negligible and inconsequential respects, but a review of the evidence shows no measurable advantage *even in these negligible matters.* (Putnam R. 1158-61; Kelly R. 1374; Add. Fdg. 40, R. 678.)

Thus the reduction in the number of lockages arising from the construction of the smaller number of high dams is offset by locks of higher lift (Putnam R. 1158-9, 2325-6;

Comp. Exs. 932, 935; Barker R. 2000-3), by the necessity of breaking up of standard Ohio River tows at the smaller TVA locks above Wilson (Putnam R. 1158, 1172; Barker R. 2003-4; Watkins R. 1601-2)[1] and by the fact that for a substantial and important period of the year there will be open river navigation and, therefore, practically unlimited capacity under the Federal Navigation Project, just as is the case with the federal navigation project on the Ohio River. (Add. Fdgs. 30, 35, R. 677; Putnam R. 1154, 1159; Barker R. 2004, 2013.)

The appellees claimed that smaller fluctuations of stage in the pools in the TVA Unified Plan will benefit terminal facilities, but there is no difference in pool fluctuations under the Federal Navigation Project and under the TVA Unified Plan at the four principal terminal sites upon the Tennessee River,—that is, Florence, Sheffield, Chattanooga and Knoxville (Add. Fdg. 20, R. 675; Putnam R. 2298, 2330, Offer to Prove, R. 2332-3; Barker R. 2010-11; Watkins R. 1609-11), and the fluctuations that exist at these points are inconsequential. (Putnam R. 2330.) The TVA Unified Plan will destroy one of the most modern existing terminals on the river at Danville, Tennessee. (Watkins R. 1611-12; Putnam R. 1167.) There is no record of federal expenditure to avoid natural fluctuations of stage for the benefit of terminals on the Ohio, Monongahela, or any other important inland waterway. (Barker R. 2020.) Fluctuations in stage on the Ohio River very greatly exceed those on the Tennessee River. (Watkins R. 1612.)

The suggestion that the TVA high power dams benefit navigation by backing water up into the mouths of tributaries is plainly without substance. Not only did the Chief of Engineers fail to recommend the improvement of

---

[1] The small TVA locks above Wilson also necessitate the breaking up of the only important tows (railroad car ferry at Guntersville, Ala.), which are presently and for many years have been using the Tennessee River. (R. 1953.)

any tributary of the Tennessee River (Comp. Ex. 105°, pp. 1-7; Barker R. 1986-7), but the backing up of the water into the mouths of tributary streams creates no navigable channel reaching any potential commerce (Barker R. 1983-4, 2005-6; R. 2008) and is in fact merely the incidental result of the construction of the high power dams on the main stream. (Barker R. 2007.) Indeed, the only substantial effect is to flood some valuable farm lands. (Offer to Prove, R. 1244-50.)

Appellees' claim that the greater depths of the large TVA lakes will benefit navigation by making greater speeds possible is insubstantial (Putnam, Offer to Prove, R. 2329), if not wholly unfounded. The depths which would be provided by the Federal Navigation Project are wholly adequate and conform to the development of the remainder of the Mississippi River system. (Add. Fdg. 3, R. 671; Putnam R. 1169; Comp. Ex. 105°, pp. 100, 5, 6, pars. 79, 17, 23.) Depths greater than necessary to eliminate bottom friction are of no value to navigation and excessive depths are hazards to navigation in that they make it difficult to ground boats immediately in case of accident and increase the difficulty and expense of salvage operations when boats founder. (Add. Fdg. 36, R. 678; Putnam R. 1160, Offer to Prove, R. 2329-30.) The large lakes impounded behind the TVA dams have sufficient depth and width to permit the creation of waves of 3 feet or more in height. (Add. Fdg. 38, R. 678; Putnam R. 2304, Willson R. 1392.) Any theoretical advantage in increased speed of tows is not only practically negligible, but is far more than offset by the increased hazard to the equipment having limited freeboard, which is used in inland water transportation, from wind and waves upon the large TVA lakes (Putnam R. 1158-61, 1187, 2304, Offer to Prove, R. 2329; Willson R. 1392-3, 1395; Add. Fdg. 37, R. 678) and the much more serious consequences of the inevitable oc-

casional accidents in such deep water.[1] (Putnam R. 1160, Offer to Prove, R. 2329-30.)

Of like character is the appellees' claim that lower current velocities will prevail at the heads of the large TVA lakes than would occur at the heads of the small pools behind the low navigation dams of the Federal Navigation Project. There is no proof that the current velocities under the Federal Navigation Project would be a material consideration (Putnam, Offers to Prove, R. 2309, 2327-9) or that they would be greater than those prevailing on more important inland waterways where the Congress has never dreamed of spending hundreds of million of dollars to transform the rivers into vast artificial lakes.

---

[1] The appellees advanced the claim that the Corps of Engineers is substituting "high" dams for "low" dams on navigation projects. This, however, is a mere play on words. In fact, the Engineers Corps is merely replacing certain antiquated navigation dams by new dams which are "high" dams only in the sense that their height is slightly greater than that of the antiquated dams which they are replacing. None of these modern navigation dams remotely approaches in height any of the dams in the TVA Unified Plan. In fact, the appellees were unable to cite any instances where the new dams are high enough to extend the river beyond its natural banks (Watkins R. 1618); and this would be contrary to the practice of the Corps of Engineers (Putnam R. 1187, 2337.)

Appellees also advanced the contention that the Corps of Engineers is no longer constructing wicket dams (that is, dams with navigable passes), although they were unable to offer any proof that the Corps of Engineers had adopted such a policy. As a matter of fact the Corps of Engineers has currently recommended the construction of wicket dams on the Ohio River (Putnam R. 2310-12; Comp. Ex. 936†, excluded, pp. 1, 2, 14, 157) and is presently constructing dams of this type at La Grange and Peoria on the Illinois River (Annual Report of the Chief of Engineers for the fiscal year ending June 30, 1937, Vol. I, p. 974.) Of course, the determination of whether a navigation dam shall be a fixed dam or shall have a navigable pass is solely a question of judgment as to which will be the more beneficial to navigation on the stream and has nothing to do with the height of the dam.

Over-all Comparison: The structures in the TVA Unified Plan are not primarily designed to improve navigation on the Tennessee River. (Add. Fdg. 21, R. 675; Putnam R. 1169.) They are precisely the kind of structures which would be built by a private power company for the purpose of developing rapidly the maximum amount of power. (Add. Fdg. 75, R. 685; Crane R. 1283-4; Kurtz R. 1218; Bowman R. 1744, 1765.) The navigation facilities incidentally provided in connection with the power project embodied in the TVA Unified Plan are over-all inferior to the Federal Navigation Project. The vast additional expenditure provides no additional navigable capacity or navigation advantages. The explanation of the huge additional expenditure cannot be found in navigation (Add. Fdg. 15, R. 674; Putnam R. 1161, 1169; Kelly R. 1375; Comp. Ex. 105°, pp. 4-5; Comp. Exs. 105A, 105B, R. 2616A, B; Comp. Ex. 346*) but is plainly attributable to power development. (Crane R. 1284; Kurtz R. 1218-19.)

The situation was accurately summarized by *General George B. Pillsbury, then Assistant Chief of Engineers,* in his testimony given before the House Committee on Military Affairs (Comp. Ex. 365†, pp. 301-2) on proposed amendments to the TVA Act, as follows:

> "General Pillsbury: Congress authorized, in the Rivers and Harbors Act of 1930, the construction of locks and dams on the Tennessee River at an estimated cost of $75,000,000 or $70,000,000—I think $75,000,000—to provide 9-foot barge navigation to Knoxville, at the head of the river.
>
> The estimates were based on low navigation dams, but the Act, in accordance with the recommendation of the Chief of Engineers, provided that if high dams were built by the States, municipalities, or private corporations under licenses from the Federal Power Commission, as then provided by law, that the cost of the low dams would be contributed to the cost of the high dams which would replace them.

> The Tennessee Valley Authority is constructing high dams in certain localities. * * * They invariably consulted us *on all matters relating to navigation.*
>
> Mr. McLean: Have they embarked on a program of high dams instead of the low dams?
>
> General Pillsbury: Yes. *The low dams have no power value whatever.*
>
> Mr. McLean: *So that the high dams would be constructed with the idea of electrical power generation only in view?*
>
> General Pillsbury: *Oh, yes.* The high dams are very much more costly than the low ones. *They are not better for navigation,*[1] *but the justification for their large expenditure can be found only in the power that they make available.*"

A review of the evidence leaves no doubt that the water power is not coming into being and is not to come into being, as the incidental result of structures built or to be built for the improvement of the Tennessee River for navigation.

(2) The creation of none of the water power is incidental to the operation of structures built for protection against flood damages to navigation.

Flood damages to navigation on the Tennessee River are negligible in character and amount and would not be reduced by the TVA Unified Plan in an amount sufficient

---

[1] The court in its opinion states that the main stream dams "are essential to the *maintenance* of 9-foot navigation." (R. 550.) In fact these high dams were essential and desirable only for power development, and they are related to the maintenance of 9-foot navigation only in the sense that, if and when they are built, they will submerge, and make impossible the use of, any navigation facilities other than those incidentally resulting from power development so long as they remain.

to justify any capital expenditure. (Putnam R. 1167; Add. Fdg. 44, R. 679.)[1]

The completion of the TVA Unified Plan would not eliminate any measurable amount of flood damages to navigation on the Mississippi River (Kelly R. 1374, 1368); and moreover TVA is not granted any power or charged with any duty under the TVA Act with respect to navigation on the Mississippi River. (Add. Fdg. 45, R. 679.) No part of the cost of the TVA Unified Plan may properly be charged to protection against, or elimination of, flood damages to navigation on the Tennessee or Mississippi Rivers. (Kelly R. 1374; Putnam R. 1167.)

(3) None of the TVA commercial water power is created as the incidental result of the operation of any flood control structures; and such flood control structures as are included in the TVA Unified Plan are a minor, if not a pretensive, part and purpose of that Plan.

On this issue also the majority of the trial court failed or refused to make any findings on essential facts, that is, whether, and if so to what extent, any of the water power is or will be created by the operation of structures built for flood control. Their conclusory findings, to the extent, if at all, that they may be apposite, are not only unsupported by evidentiary findings and by the record but are against the clear weight of the evidence. Their conclusory findings and many of their evidentiary findings are based upon an erroneous conception of law as to the constitutional power of the Federal Government to acquire water

---

[1] In so far as Fdg. 59 (R. 612) states or implies that flood damages to navigation are not inconsequential and that they would be appreciably reduced by the TVA Unified Plan, it is a bare conclusion, not supported by findings of essential underlying facts or by the evidence. It was rejected by Judge Gore. (R. 669.)

power or electricity and as to the nature and scope of any federal power over flood control.[1]

TRIBUTARY PROJECTS. (a) *None of the commercial water power created by the tributary projects is created by the operation of flood control structures.* A review of the evidence shows that the tributary projects severally consist of a large power reservoir upon which is superimposed a small flood control reservoir and that such flood control reservoirs do not and can not produce any commercial power. The tributary projects consist of the Norris project on the Clinch River, the Hiwassee project on the Hiwassee River and the Fontana project on the Little Tennessee River. The Norris project is a typical tributary project and it is sufficient, therefore, to review the evidence bearing upon the structural and functional characteristics of this project.

The Norris Dam is 214 feet high from the bottom of the river to the top of its gates, elevation 1034. (Comp. Ex. 328°, pp. 91, 92; Comp. Ex. 362*; Def. Ex. 50*, 51; Wessenauer R. 2190.) The lower 135 feet, or up to elevation 955, is built and utilized to create *dead storage* by impounding water above the dam so as to concentrate the fall of the river and thus make possible the production of commercial power. The purpose and function of this dead storage at Norris is to make possible the production of electric power. (Kurtz R. 1210, 1213; Comp. Ex. 362*; Wessenauer R. 2189-90; Add. Fdg. 70, R. 684; Creager, Offer to Prove,

---

[1] Fdgs. 39, 47, 60, 62, 63, 65, 68, 69, 74-6, 93, 94 are bare conclusions unsupported by findings of essential underlying facts or by evidence. Fdgs. 39, 41-7, 60-69, 74-6, 79, 93, 94 are unsupported by and contrary to the clear weight of the evidence. Fdgs. 39, 42, 44, 46, 47, 58-60, 65, 68, 69, 73, 74, 79, 93, 94 are based upon an erroneous conception of law. (See p. 128, *infra*.) The extent to which the foregoing findings are erroneous is set forth in Assignments of Error 68, 72-6, 78, 79.

2406-7.) This dead storage behind Norris Dam is shown upon drawings of Norris Reservoir storage contained in a technical article published by one of the TVA engineers (a witness for appellees) before the trial of this litigation and in drawings offered as exhibits in the *Ashwander* case[1] by another TVA engineer who also appeared as a witness for appellees in this suit.[2] (Bowman R. 1750; Kimball R. 1862; Comp. Exs. 904, 912*.)

The volume of this dead storage behind Norris Dam is 570,000 acre feet. The space occupied by this dead storage behind Norris Dam has no flood control value because it is always full of water and consequently can never be used to impound any flood waters. (Kurtz R. 1213; Add. Fdg. 70, R. 684; Comp. Ex. 362*.)

The next 65 feet of Norris Dam, that is, from elevation 955 to elevation 1020, is built and utilized to create *power storage*. (Kurtz R. 1212-14.) This power storage (Comp. Ex. 362*) is also shown on Comp. Ex. 904, which is a diagram of the Norris Reservoir storage prepared by the appellees' witness Bowman. (Bowman R. 1750.) This power storage at Norris Dam is provided and utilized to create additional head for power production and to provide usable storage of water for even greater production of

---

[1] *Ashwander v. Tennessee Valley Authority*, 297 U. S. 288.

[2] On Comp. Ex. 904, a drawing of Norris Reservoir prepared and published by appellees' witness Bowman after the trial of the *Ashwander* case and before the trial of this suit, the standard terms, that is "dead storage," "power storage" and "flood storage" are shown for the different types of storage at Norris. In the instant case, however, the engineering witnesses for the appellees in their testimony and exhibits have studiously avoided the use of these standard terms and substituted instead such coined terms as "minimum navigation level" for "dead storage" (even though the tributary reservoirs have no navigation facilities) and the coined term "controlled flood surcharge" for "power storage." (Def. Exs. 39, 42, 43, 45a, 46a, 47, 48, 53, 54, 151; Bowman R. 1730-1, 1733, 1749-50; Barker R. 1998; Comp. Ex. 904.)

power during the low water season, both at Norris Dam and at all the power plants on the main river below. (Kurtz R. 1212-14; Comp. Ex. 362*; Bowman R. 1734, 1739, 1742; Wessenauer R. 2189-90; Add. Fdg. 70, R. 684.) This power storage at Norris is filled annually. (Def. Ex. 90*.)

The volume of this power storage at Norris is 1,500,000 acre feet. This power storage has no genuine flood control value because, manifestly, if this space is full when the inevitable flood occurs, it is not available to impound the flood waters (Kurtz R. 1214; Add. Fdg. 70, R. 684); and whether any of this space will be empty when the flood occurs, and if so, how much, is not only uncertain and unpredictable, but is merely incidental to, and dependent upon, the power operations which utilize this power storage for power production. (Kurtz R. 1214; Def. Ex. 90*.) Floods do not occur just because the power storage of a dam happens to be empty. Nor do they fail to occur just because the power storage of a dam happens to be full. Genuine flood storage must be available whenever a flood occurs. (Kurtz R. 1213-14; Watkins R. 1560-2.)

There is an irreconcilable conflict between flood control and power development, that is, between keeping the reservoir space empty to catch the inevitable flood when it does occur and keeping the reservoir space full to create head and storage for power production.[1] There is no object in keeping water permanently or seasonally in a reservoir except for power production or for industrial or domestic use. This was conceded by appellees' witness Woodward when he stated that partial filling is not for flood control, but for the benefit of low water regulation, which in-

---

[1] Were this not so, every private power development would be a flood control project, which it is not. Indeed, some surcharge capacity above the power storage is often necessary merely to compensate for natural valley storage destroyed by the power reservoir. (Watkins R. 1562, 1565-6; Kelly R. 1373; Comp. Ex. 411.*)

creases the amount of firm power. (Woodward R. 1788, 1798-9, 1815; Add. Fdgs. 80, 85, R. 686-7; Kurtz R. 1213-14.) The only flood control value in power storage is that undependable and accidental amount that is inherent in every power dam of every power company in the country, but such storage does not constitute flood protection because it is obviously impossible to fill a reservoir early in the year for power production, as the Norris Reservoir is filled, on the assumption that a prediction can be made that a great flood will not occur.[1] Great floods have occurred on head waters of the Tennessee and nearby rivers during the summer and at other times of the year. (Justin[2] R. 2376-8; Comp. Ex. 941; Kurtz R. 1198; Add. Fdg. 73, R. 684; Minser, Offer to Prove, R. 2365-8, 2370.)

The conflict between flood control and power development was recognized by appellees' witness Bowman in a technical article written prior to the trial of this suit (Bowman R. 1738, 1749-50; Comp. Ex. 904; Add. Fdg. 80, R. 686), and in a Congressional Hearing in 1937 (Comp. Ex. 116†, p. 344), by Dr. A. E. Morgan who testified:

> "For power development it is desirable to store water as quickly as possible during high water and to use it in low water. For flood control it is desirable

---

[1] It is no more possible to make such a prediction than it is to tell whether a coming year will be a low water season. It is not possible to predict rainfall or to predict at any time of any year, whether the rest of the year will be dry or wet, and, manifestly, reservoirs cannot be operated on hindsight. (Add. Fdg. 55, R. 680; Woodward R. 1811, 1822; Kimball R. 1884; Floyd R. 1901-2.)

[2] Joel D. Justin, consulting hydraulic engineer on flood control, irrigation and hydro-electric developments in this country and abroad, including a large number of flood control projects now under construction and completed for the Federal Government; author of standard text-books and numerous technical articles on flood control, hydro-electric developments and related subjects. (R. 2373-5.)

to keep the reservoir capacity empty, as much as possible. For power development a full reservoir is best. For flood control an empty reservoir is best. There is a certain tendency to conflict there."

This examination of the structural and functional characteristics of the Norris project shows that the first 200 feet of Norris Dam above the river bed, or up to elevation 1020, impounds dead and power storage and produces the commercial power created by that project. This large power reservoir, creating the commercial power, has been purposefully and separately built; it is filled annually for power; it is drawn down annually for power; it is operated exactly the same as any power reservoir of any utility and it provides no flood storage except an undependable amount that is inherent in every power dam of every power company in the United States. (Kurtz R. 1212-14; Comp. Ex. 362*; Bowman R. 1734, 1739, 1741-2; Wessenauer R. 2189-90.)

The top 14 feet of Norris Dam, or from elevation 1020 to 1034, is built and utilized to create flood storage. This storage space, like all genuine flood storage, will be kept empty at all times except when it is temporarily in use to impound flood waters during a flood. Such flood waters will be released as rapidly as practicable in order to make the space available to catch the next flood. In other words, this storage space will be available to impound flood waters no matter what time of year the flood may occur, except that when filled beyond elevation 1029 or 1030, it will flood and has flooded towns, highways and bridges. (R. 1855; Woodward R. 1822; Kimball R. 1855; Bowman R. 1769.) This top 14 feet of the dam is the precise equivalent of a 14 foot dam built as an entirely separate and distinct project on the top of the power reservoir or of a flood control reservoir of equal capacity built along side of the power reservoir. This top 14 feet is the only genuine flood

control storage provided in the Norris Project.[1] (Kurtz R. 1210, 1214; Comp. Exs. 362*; 904.)

The volume of this flood control storage is 497,000 acre feet. (Kurtz R. 1210, 1214; Comp. Ex. 362*; Add. Fdg. 70, R. 684.) This flood storage at Norris Dam can not and does not produce any commercial power for the very simple reason that this space is always kept empty to impound flood water when a flood occurs and the impounded flood waters are discharged as rapidly as practicable. Consequently none of the commercial water power created by the tributary dams, of which Norris is typical, can be or is created by the operation of any flood control structure. (Kurtz 1214; Add. Fdg. 70, R. 684.)

The evidence shows that the Norris project consists of a large power reservoir (dead storage and power storage) upon which is superimposed a small flood control reservoir (flood control storage). The power reservoir is 200 feet high measured from the bottom of the river and the superimposed flood control reservoir is only 14 feet high. The power reservoir, separately and purposefully built, creates all of the commercial power, but it does not provide any genuine flood control; and the small flood control reservoir does not, incidentally or otherwise, produce any commercial power.

The trial court excluded as immaterial official statements issued by TVA, stating that "*Norris Dam is being built for power development*" (Comp. Ex. 863, excluded, R. 3829) and that:

> "If we admit that the use of electricity can not be increased manyfold; if that is our mental attitude, then

---

[1] The tributary reservoirs are far beyond prediction distance from the Mississippi River. (Woodward R. 1783, 1806-8.) Hence, for this and other reasons, the limited flood storage of the tributary reservoirs could not benefit Mississippi floods. (See pp. 57-60, *infra*.)

we must be logical and immediately stop construction of the Cove Creek Dam (Norris) and of the Joe Wheeler Dam." (Comp. Ex. 800, excluded, R. 3706.)

Prior to the construction of Norris Dam, appellee, Dr. A. E. Morgan, while testifying before the House Committee on Appropriations (Comp. Ex. 108†, p. 25, R. 2621-2) in 1933. frankly admitted that it was to be built for the development of power:

> "Mr. Collins: You will build the same type of dam (at the site of Norris) that you would build if there was a scarcity of power, and you were building it for the development of further power. In other words, you will build that kind of dam.
>
> Dr. Morgan: Yes, sir."

The record thus discloses not only that the small flood control structure superimposed on the top of the Norris project creates none of the commercial power, but that power development was the primary and dominant purpose of the construction of the Norris project as well as of the other tributary projects. (Crane R. 1284; Kurtz R. 1218-19; Dr. A. E. Morgan, Comp. Ex. 112†, pp. 252-3, 287, R. 2674, 2680; Add. Fdg. 73, R. 684.)

(b) *Two and six-tenths times as much flood storage could have been provided at the site of Norris Dam for less than one-quarter of the cost of Norris Dam.* Norris Dam cost $36,310,370. (Fdg. 29, R. 600; Kurtz R. 1210; Comp. Ex. 362*; Comp. Ex. 116†, p. 403, R. 2700A.) This dam provides genuine flood storage of only 497,000 acre-feet with no allowance for the destruction of natural valley storage by the power structure upon which the small flood control structure is superimposed. A flood control dam could have been built at the same site as the Norris Dam for $8,136,000, providing 1,312,000 acre-feet of genuine

flood storage. (Add. Fdgs. 69, 70, R. 683-4; Kurtz R. 1210, 1214; Comp. Ex. 362*.) TVA engaged the Bureau of Reclamation to design the Norris Dam. (Comp. Ex. 113°, p. 2.) This Bureau, through one of its engineers, reported that a reservoir for flood protection alone with flood storage of 1,255,000 acre-feet could be built at the site of the Norris Dam for approximately $7,150,000. (Woodward R. 1816.) *This project would have produced no electric power.* This evidence shows that two and six-tenths times as much flood storage could have been provided at the site of Norris Dam for less than one-quarter of the cost of Norris Dam and that Norris Dam was built for some other purpose than flood control. (Add. Fdgs. 69, 70, R. 683-4.) That purpose is the maximum production of power as stated in the TVA Act itself. (TVA Act, Sec. 17.) Norris is typical of all the TVA tributary projects (see p. 38, *supra*). The trial court excluded authorized public statements by appellees that Norris Dam was being built for power development and that its construction is not justified unless there is a market for the power.[1]

(c) *The tributary projects increase five-fold the amount of firm power which could otherwise be produced on the Tennessee River.* These tributary projects increase the firm continuous capacity of the TVA power project from 110,000 kilowatts to 660,000 kilowatts. (Add. Fdg.

---

[1] "The Norris Dam is being built for power development, but that is not an end in itself. We do not develop power just so that there can be power development. We develop power to contribute to the well-being of the people in this region. It is only a means to an end. The object of building a dam is to provide power; the object of providing power is to raise economic and social conditions of a region." (Comp. Ex. 863, excluded, R. 3829.) "Take the Norris Dam, for instance. It would not pay to build it in the hope that somebody might wish to buy its power in the future. It is not justified unless you can count on a market. That is true for other up-river dams." (Comp. Ex. 844, excluded, R. 3798.)

11, R. 673; Comp. Ex. 328°, p. 62; Kurtz R. 1215; Comp. Ex. 115†, p. 279, R. 2697.) None of this increase in firm power results from any flood control storage provided at any of the tributary reservoirs but solely from the utilization of the power storage provided at those reservoirs. The evidence shows that the appellees have faithfully followed the statutory mandate to construct the Cove Creek (Norris) Dam "*so that the maximum amount of primary power may be developed* at Dam Numbered 2 (Wilson) and at any and all other dams below the said Cove Creek Dam." (TVA Act, Sec. 17.) The trial court in its opinion expressly finds that the statute required Norris Dam to be constructed and operated so that the maximum amount of primary power may be developed at all other dams downstream and that "Norris Dam was built and is being operated to create extra head of water power at Wilson Dam." (R. 559.) The TVA reservoirs are constructed to produce the maximum amount of power (Crane R. 1284; Kurtz R. 1218-19; Dr. A. E. Morgan, Comp. Ex. 112†, pp. 252-3, 287, R. 2674-80.) And Judge Gore found that the proposed method of operation of all the TVA dams is not for flood control but primarily for the purpose of power. (Add. Fdg. 73, R. 684.)

(d) *The TVA Unified Plan will provide no flood protection on some of the most important tributaries of the Tennessee River where the greatest flood damage has been experienced.* The TVA Unified Plan provides no flood protection on the Holston River or the French Broad River which are two of the most important tributaries of the Tennessee River.[1] (Comp. Ex. 328°, p. 12; R. 1209; Kurtz

---

[1] The trial court excluded an official TVA Press Release stating that the building of tributary reservoirs has been determined by the opportunities for power development:

"The Tennessee Valley Authority has been importuned by many people to prepare designs for a water power dam

(Continued on page 47)

R. 1205; Comp. Exs. 354*, 355; Kimball R. 1852, Watkins R. 1583.) On the Emory River where seventy-five per cent of the total flood damage on all tributaries occurs and where twenty-two lives were lost in the 1929 flood, no protection whatsoever is afforded by the TVA Unified Plan (Kurtz R. 1196, 1199, 1207, 1209; Kimball R. 1886; Watkins R. 1583; Add. Fdgs. 50, 64, R. 680, 683.) Any genuine flood control system would provide protection on these important tributaries.

The estimated annual average flood damages on the French Broad River are $110,416, on the Holston River $28,850 and on the Emory River, exclusive of damage to lands, $355,500, or a total of $495,260. (Comp. Ex. 105°, p. 734, Col. 16; Comp. Ex. 349, Col. 9, R. 3084-B.) On the other hand, the estimated average annual flood damages on the Hiwassee (including the Ocoee) are $21,725, on the Little Tennessee River (including all its tributaries) are $26,495 and on the Clinch River, exclusive of damage to lands, are $33,590 (Comp. Ex. 549, R. 3084-B), and including the damage to lands on the Clinch, Emory and Powell Rivers (not segregated), the average annual flood damages on the Clinch River would be about $46,000 a year. (Comp. Ex. 105°, p. 734, Col. 6.)

Thus the total average annual flood damages on the Clinch, Hiwassee and Little Tennessee Rivers (including an excessive amount for damages to lands on the Clinch) are $94,220. The trial court excluded, as immaterial, evidence

---

and regulating reservoir on the French Broad just above Asheville. The topography of this site affords a natural reservoir basin which, considered for its physical aspects alone, is one of the best of such sites in the Tennessee Valley. However, the preliminary data available at the present time regarding this proposed project appear to indicate that *the cost of water power produced there would be so much greater than the cost of similar power produced at other locations*, that we are forced to the conclusion that the construction of a dam at this site is not economically justified at the present time." (Comp. Ex. 872, excluded, R. 3856.)

that the average annual value of crops standing in September and October on lands which will be flooded by the Chickamauga, Guntersville, Pickwick Landing and Wheeler reservoirs at normal pool level was $3,126,000, or an average of over $20 per acre. (Offer to Prove, R. 1244-50; Def. Ex. 153†, p. 947.) On the same basis, the total value of crops on lands flooded, or to be flooded, by the three tributary reservoirs, would be approximately $992,000 annually. (Def. Ex. 153†, p. 919.) While the average annual value per acre of crops in the tributary basins is doubtless less than in the Tennessee Valley, the average annual value of the crops destroyed by the tributary reservoirs is a very substantial figure.

The capitalized value at 4 per cent of the total average annual flood damage on the Clinch, Hiwassee and Little Tennessee Rivers, is less than $2,400,000. The three TVA projects on these tributaries, which would eliminate only a part of this average annual flood damage, will cost approximately $120,000,000.

The greatest practicable flood protection on the tributaries and on the main river could have been obtained at a fraction of the cost of the TVA system by the construction of genuine flood control reservoirs on the Emory, Holston, French Broad, Clinch and Hiwassee Rivers. Such a system of genuine flood control structures, built and operated solely for flood control, could have been built for about one-sixth of the cost of the TVA power projects (see pp. 55-57, *infra*) and for about $40,000,000 less than the cost of the three tributary power projects alone. Such a system would provide ten times as much flood storage in a great flood at and above Chattanooga (where practically all flood damage in the Tennessee Valley occurs) as the TVA Unified Plan, and an immeasurably greater ratio of protection to life and property (Kurtz R. 1205-7; Comp. Ex. 353, 355, 357*); for the limited flood storage of the small flood control reservoirs constructed on top of the TVA power

structures would have a negligible effect and be of negligible value in a great flood when flood protection is the most needed and the most valuable. (Comp. Exs. 352*, 354*, 356, 357*, 358*, 359*.)

Main River Projects. (a) *None of the commercial water power created by the main river projects is created by the operation of any flood control structures.* This appears from an examination of the evidence bearing upon the structural and functional characteristics of the main river projects. We have previously pointed out that five-sixths of the firm water power which will be created by the TVA Unified Plan is created by the use of the tributary projects. (See pp. 45-46, *supra.*) However, the remaining 110,000 kilowatts of firm power which could be produced at the main stream dams without the tributary projects is not brought into being by the operation of any flood control structures. (Kurtz R. 1213.) The Guntersville project is a typical main river project. It is sufficient, therefore, to examine the structural and functional characteristics of a typical Tennessee River project.[1]

The Guntersville Dam which is located on the Tennessee River about midway between its mouth and its source, is approximately 60 feet high from its foundation to the top of its gates and extends 40 feet above its normal tailwater at elevation 555 to the top of its gates at elevation 595. (Comp. Ex. 328°, p. 82; Def. Ex. 45A.) The first 36 feet above normal tailwater is built and utilized to impound water permanently up to elevation 591, which is commonly called minimum headwater elevation, but which has been denominated minimum "navigation level" by the ap-

---

[1] The TVA dams on the main river are Pickwick Landing, Wheeler, Guntersville, Chickamauga, Watts Bar, Coulter Shoals and Gilbertsville which does not differ from these main stream projects in nature or function but does include a larger amount of flood control storage so its functions will be examined separately.

pellees for the purpose of this suit. (Comp. Ex. 328°, p. 82; Def. Exs. 44*, 45A.) This dead storage at Guntersville differs from the dead storage at Norris only in that this storage behind the Guntersville Dam incidentally provides a water surface which must be used by navigation in lieu of the navigation pools of the Federal Navigation Project which are submerged by the large power lake of the TVA power project. As shown by the evidence reviewed at pages 22-36, *supra*, the main stream reservoirs are power developments with merely incidental navigation facilities, but from the standpoint of flood control, it is immaterial whether this storage is regarded as dead storage or navigation storage; for in any event, it has no flood control value because it is always kept full of water and consequently can not be used to impound flood waters when floods occur. (Kurtz R. 1213; Wessenauer R. 2189; Creager, Offer to Prove, R. 2406-7; Add. Fdg. 70, R. 684.) However, this dead storage, by concentrating the fall of the river at the dam, produces firm or commercial power. (Kelly R. 1373; Kurtz R. 1210, 1213; Wessenauer R. 2189-90.) The volume of this dead storage is 709,000 acre feet. (Def. Ex. 45A.)

The next three feet of the Guntersville Dam, that is, between elevations 591 and 594, is built and utilized to create power storage. (Kelly R. 1373; Kurtz 1210, 1213; Wessenauer R. 2189-90.) The volume of this power storage is 177,000 acre feet. (Def. Exs. 54, 153†, p. 975.) This power storage will be filled after April 1st of every year. (Wessenauer R. 2190.) The only purpose of filling this power storage annually is to provide additional storage for the production of power. It would not be filled for navigation because the dead storage has already provided navigable depths. A contrary contention would admit that the incidental navigation facilities of the TVA Power Project are completely inadequate except when the power storage is entirely filled. It would not be filled for

flood control because flood control demands that flood control space be kept empty for the inevitable flood whenever it may occur. Floods may occur and have occurred at any time of the year. (Add. Fdg. 73, R. 684; Justin R. 2376-8; Comp. Ex. 941; Kurtz R. 1198, 1204; Kimball R. 1882; Minser, Offer to Prove, R. 2365-8, 2370.) The uncertain possibility that some unpredictable amount of this power storage, which is regularly filled annually, may happen to be empty at the time of a flood as the incidental result of power operations, just as in the case of any privately owned and uncamouflaged power reservoir, does not constitute flood control. The evidence thus shows that there is nothing incidental about the creation of water power which is created by purposefully building storage for that purpose. This power storage provides no genuine flood control. (Kurtz R. 1214.)

The top one foot of the Guntersville Dam, that is, between elevation 594 and 595, provides the only genuine flood control storage included in the Guntersville project. This storage will be kept empty at all times of the year in order to impound flood waters when the inevitable flood occurs and the impounded flood waters will be released as rapidly as practicable. The volume of this flood control storage at Guntersville is 65,000 acre feet, and because it is kept empty, like any *bona fide* flood control reservoir, it creates no firm or commercial power. (Def. Exs. 45A, 54; Kurtz R. 1213-15.)

The evidence thus shows that the Guntersville project consists of a power dam 39 feet high from its normal tailwater to its normal water surface at elevation 594, on top of which is superimposed a flood control dam one foot in height. The total storage up to normal pool level or the top of the power dam is 886,000 acre feet. (Def. Ex. 54.) The flood storage provided by the superimposed flood control dam is only 65,000 acre feet. This flood storage is too

insignificant in amount to be of any practical value and does not even compensate for the natural valley storage destroyed by the dead and power storage in a great flood. The evidence thus shows that the Guntersville project is the equivalent of a power dam 39 feet high (which produces all of the firm or comercial power), on which is superimposed an entirely separate flood control structure one foot in height[1] which creates no firm or commercial power.

The Gilbertsville project on the main stream does not differ from the other main stream projects in nature or function, but the flood storage at Gilbertsville[2] is much greater both in volume and in relation to its dead and power storage than in the case of the other main stream projects. (Def. Ex. 39.) The flood storage at Gilbertsville can provide no flood protection for the Tennessee Valley because this dam is located only a short distance above the mouth of the Tennessee River and because the land along the river below the Gilbertsville site has been and will continue to be subject to flooding by backwater from the Ohio River. On the contrary, it permanently floods 160,000 acres of valuable valley lands. (Def. Ex. 153†, p. 919.) While the evidence hereinafter reviewed shows that the flood storage at Gilbertsville does not provide any measurable or consequential flood protection on the Mississippi River, that is not material in this connection because whatever may be the volume of flood storage at Gilbertsville (and it has been repeatedly changed on paper even during the trial of this suit (Bowman R. 1726-7)), and whatever

---

[1] The heights of the superimposed flood control structures on the remaining main river dams are as follows: Pickwick, 5 feet; Wheeler, 1 foot; Chickamauga, 3 feet; Watts Bar, 5 feet; Coulter Shoals, 5 feet. (Def. Exs. 42-54; Comp. Ex. 328°, p. 82.)

[2] The height of the superimposed flood control structure on top of the Gilbertsville power dam is 16 feet. (Def. Exs. 39, 54.)

may be its effect, if any, on flood stages in the Mississippi Valley, the flood storage at the Gilbertsville project creates none of the firm or commercial power to be created by the TVA Unified Plan. This is because the genuine flood storage at the Gilbertsville project would always be kept empty in order to impound flood waters when the inevitable flood occurs. As in the case of the other main stream projects, all of the firm or commercial water power at Gilbertsville will be created by the power dam which will provide no genuine flood control.

(b) *That flood control is a minor part and purpose of the main river projects also appears from the fact that the small flood control structures superimposed on them do not provide adequate or dependable flood control.* The trial court found that practically all damage from floods on the main stream occurs at and above Chattanooga, and that "a flood control program to achieve the maximum practical protection upon the Tennessee River and its tributaries should be directed primarily for protection at and above Chattanooga." (Fdgs. 81, 85, R. 619; Kurtz R. 1196-7; Comp. Ex. 349, R. 3084; Watkins R. 1582.) During large floods the main river dams above Chattanooga are wholly flooded out and provide no flood storage capacity.[1] (Comp. Ex. 359*; Kimball R. 1868-9; Add. Fdgs. 65, 83, R. 683, 686.) Any dependable reduction in the maximum flood stage at Chattanooga by the TVA Unified Plan is insignificant, and even the maximum undependable reduction in such stage which might be achieved under the most favorable conditions would not be sufficient to render practicable the construction of levees at Chattanooga for local protection. (Add. Fdg. 63, R. 683; Kurtz R. 1206-8; Comp. Exs. 356,

---

[1] "The Chickamauga Dam is completely flooded out with the top of its gates under seven to nine feet of water by the maximum flood to be expected at Chattanooga." (Add. Fdg. 65, R. 683.)

R. 3088, 357*, 359*; see also Dr. A. E. Morgan, Comp. Ex. 895, excluded, R. 3908.) Protection by levees is the only practicable way to protect Chattanooga from floods. (Kurtz R. 1209; Kimball R. 1867-9.) The dams below Chattanooga do not protect property in the Tennessee Valley against flood damage but permanently submerge thousands of acres more land than is occasionally damaged by floods in a state of nature. (Fdg. 82, R. 619.) This results in destroying the roads, buildings and other improvements on the land permanently submerged. Flood damages below Chattanooga to cities and towns are relatively small in amount (approximately one per cent of the damage to cities and towns on the main river), and while there are some damages to railroads and highways (easily eliminated by relocation), such flood damages *consist largely of damages to farm land.* (Kurtz R. 1196-7; Comp. Ex. 105°, p. 734; Comp. Ex. 349, R. 3084; Fdg. 82, R. 619.) The main stream dams of the TVA Unified Plan *forever flood and therefore destroy* 415,700 acres of valuable farm land and the total land purchased by TVA along the main stream for flooding, exclusive of Watts Bar and Coulter Shoals, is 740,800 acres. (Def. Ex. 153†, pp. 919, 947.) This alleged flood control forever floods the very land that it should protect.

(c) *The main river projects of the TVA Unified Plan destroy a large volume of valley storage.* Valley storage is that storage which reduces the height of floods in a state of nature. (Kelly R. 1372-3; Comp. Ex. 411*; Watkins R. 1586; Clemens R. 1663-4; Kimball R. 1869, 1875-6; Comp. Ex. 914.*) Unless a reservoir or chain of reservoirs provides a sufficient amount of flood storage to offset this volume of destroyed valley storage, that reservoir or chain of reservoirs will accelerate and increase the flood heights below. The main river dams of the TVA destroy more valley storage than they provide flood storage. (Watkins R. 1562-5; Comp. Ex. 105°, p. 71, par. 39; Add. Fdg. 82, R. 686.)

(d) *The main river projects are likely to add to flood hazards by increasing flood heights on the river below.* The appellees must depend upon attempts to draw down the main river reservoirs in order to obtain any flood control or even partially to offset the destruction of valley storage. Prediction of the height and duration of floods is unreliable. (Woodward R. 1811.) Any attempt to draw down power storage in advance of floods will be likely to aggravate flood conditions (Watkins R. 1564-6) and in any event is impracticable. Such operation of the Wheeler Reservoir of the TVA system during the flood of 1937 increased the flood height on the Mississippi River over what it would have been had Wheeler Reservoir not existed. (Woodward R. 1807; Floyd R. 1901; Add. Fdg. 66, R. 683.)

(a) *That the achievement of flood control is neither the objective nor the result of the TVA Unified Plan appears from a comparison of its costs, physical aspects and ineffectiveness with the costs, physical aspects and the effectiveness of a genuine flood control system.* Had flood control been a primary, or even a coordinate, objective of the TVA Unified Plan, the evidence shows that a genuine flood control system could have been built which would have provided many times more dependable flood protection at a fraction of the cost of that Plan. (Add. Fdgs. 58, 60, 61, 67, R. 681-3; Kurtz R. 1200-10; Comp. Exs. 352*-359*, incl.) The greatest practicable protection in the Tennessee Valley area could have been obtained by a system of genuine flood control reservoirs for flood protection only at a cost of approximately $81,000,000, as compared to the cost of the TVA Unified Plan of $473,650,000.[1] (Kurtz R.

---

[1] The significance of the facts that the structures in the TVA Unified Plan (with the exception of some minor flood control structures built on top of the power structures) are not adapted to or useful for flood control, that many times more flood control

(Continued on page 56)

1210; Comp. Ex. 361*.) This system of genuine flood control reservoirs would provide almost ten times as much flood storage in a great flood at and above Chattanooga (where practically all flood damage in the Tennessee Valley occurs) as the TVA Unified Plan (Kurtz R. 1205-7; Comp. Exs. 353, 355, 357*), and would in no way interfere with any navigation development on the Tennessee River. (Add. Fdg. 58, R. 681; Kurtz R. 1202; Kelly R. 1391.) It would provide an immeasurably greater ratio of protection to life and property. (Kurtz R. 1205-7; Comp. Exs. 353, 355, 357*.) It would provide protection on all of the principal tributaries of the Tennessee and would control 78 per cent of the drainage area above Chattanooga in comparison to 25 per cent by TVA. (Add. Fdgs. 46, 57, 60, 61, 67, R. 679, 681-3; Kurtz R. 1205-6; Kimball R. 1855.) The estimated reduction of more than 19 feet in stage of the maximum flood at Chattanooga by such a system of flood control reservoirs would be sufficient to render practicable the construction of levees at Chattanooga necessary for local protection, whereas any reduction which may result from the TVA Unified Plan is not sufficient to render practicable the construction of such levees. (Add. Fdgs. 62, 63, R. 682-3; Comp. Exs. 356, 357*; Kurtz R. 1207-9.)

The total average annual flood damages on the Tennessee River and all its tributaries (including estimated damages from a hypothetical 500-year flood) is only $1,784,000. (Comp. Ex. 105°, p. 734, col. 16.) The capitalized

---

could be achieved by constructing bona fide flood control structures at a fraction of the cost of the TVA Unified Plan and that such relatively minor flood control structures as have been superimposed upon the main TVA power structures do not produce any commercial power, is not that a better flood control plan could have been designed (as the trial court erroneously assumes in disposing of this issue, Opinion R. 561) but that, with the minor exception above noted, the structures in the TVA Unified Plan are unrelated to flood control and that such minor flood control structures, as have been superimposed on the TVA power structures, produce no commercial power.

value of these flood damages at 4 per cent is less than $45,000,000. The projects of the TVA Unified Plan, costing over $473,000,000, eliminate only a portion of this average annual flood damage and permanently flood more land than is occasionally flooded in a state of nature. (Fdg. 82, R. 619.)

The TVA Unified Plan does not give adequate flood protection because TVA has spent its funds on large power reservoirs on a few tributaries rather than in building flood control reservoirs on all the important tributaries at much less cost and because all of the TVA dams have been, or are to be, built as power dams for the maximum production of power. (Crane R. 1284; Kurtz R. 1218.)

(b) *The TVA Unified Plan will not decrease the cost of the flood protection system on the Mississippi River or have any appreciable effect on the control of Mississippi floods.* The present system of flood protection and flood control on the Mississippi River below Cairo consists of levees, by-passes (floodways) and channel rectification known as the Jadwin Plan. (Comp. Exs. 409,* 410.*) It was adopted by Congress in 1928 following the great flood of 1927.[1] Recently General Markham, while Chief of Engi-

---

[1] Prior to the Rivers and Harbors Act of May 15, 1928, Congress had never adopted a federal project to provide a complete levee and flood protection system along the Mississippi River from Cairo to its mouth. Previous to that time flood protection on the Mississippi had been a mixture of localized federal projects for navigation purposes and levees constructed by States and their political subdivisions. Due to inability or unwillingness to finance such work, the levee sections under state and local jurisdiction were frequently not built up to grade or properly maintained. (Okey R. 1928.) While not controverting the main facts herein stated, the appellees offered some testimony consisting, we think, of trifling and impracticable suggestions for improving or increasing the factor of safety of the Jadwin Plan without regard to the astronomically inverse relation between the cost of the suggested frills and the most optimistic prediction of benefits. The trial court refused to permit the appellants to offer any rebuttal on this point; and if any such criticism or suggestion be thought material, then the ruling of the court precluding the offer of rebuttal is plainly reversible error. (See Offers to Prove, Knappen R. 2350-60; Justin R. 2378-86; Creager R. 2402-13.)

neers, recommended certain modifications which included changes in the by-passes and channel rectification which experience had shown to be very effective in reducing flood heights within the levees. (Add. Fdg. 47, R. 679; Kelly [1] R. 1368-70, 1374; Comp. Ex. 410.*) The Jadwin Plan, as modified at the recommendation of General Markham, although not yet completed, has taken care of every flood which has occurred on the lower Mississippi since 1928, including the great flood of 1937. (Add. Fdg. 47, R. 679; Kelly R. 1379; Clemens R. 1672; Okey R. 1929.) Judge Gore further found in accordance with the manifest weight of the evidence that the completed Jadwin-Markham Plan would have been sufficient to control the Mississippi floods of 1912, 1913 and 1927 (Add. Fdg. 84, R. 687) and will be sufficient to control the maximum flood to be anticipated on the Mississippi River (Add. Fdg. 79, R. 685; Clemens R. 1672; Kelly R. 1374, 1378; Okey R. 1929, 1931) and that "the construction of the TVA Unified Plan would not avoid the necessity of completing the Jadwin-Markham Plan or decrease its cost by a single dollar." (Add. Fdg. 48, R. 679; Kelly R. 1367-8, 1374; Knappen, Offer to Prove, R. 2353.)

Even genuine flood control reservoirs on tributaries have no appreciable effect on Mississippi floods. Tributary reservoirs cannot be operated for local flood protection, requiring the release of flood water immediately after the passing of the local flood danger, and for the reduction of peak stages on a distant river into which the tributary flows, requiring the reservoirs to be kept empty regardless of local flood conditions until a dangerous stage approaches upon the main river. (Add. Fdg. 81, R. 686; Kelly R. 1372, 1371; Offers to Prove, Knappen R. 2350-1, Creager R. 2409.) Evidence in the record and official documents of which this

---

[1] For statement of Colonel Kelly's experience in relation to Mississippi flood problems, see footnote, p. 25, *supra*.

Court may take judicial notice establish that for over fifty years the Chief of Engineers has held that storage reservoirs on tributary streams are of uncertain, negligible and undependable value for flood protection on the Mississippi and that their value for local flood protection, power development and other local uses far exceeds any possible value for flood protection on the Mississippi.[1] (Comp. Ex. 105°, p. 3, par. 12; Def. Ex. 32†, p. 2, par. 8; Add. Fdg. 49, R. 680.)

The record clearly shows that certain inner levees under the Jadwin-Markham Plan are designed to be overtopped when a Mississippi River flood reaches a certain height and behind those levees are provided spillways or by-passes, confined by natural elevations or outer lines of levees, to carry the flood water and reduce flood heights. (Kelly R. 1369-70; Comp. Ex. 410*; Clemens R. 1639-42; Okey R. 1906, 1931.) Such outer levees are an essential element of any system of flood protection on the lower Mississippi River. At most in peculiar, unpredictable and undependable conditions surrounding a flood falling within a narrow range of magnitude, the TVA Unified Plan might eliminate the operation of some of the floodways. This possibility is not only too remote and speculative for con-

---

[1] Kimball offered Defendants' Exhibit 83* to show how it would have been possible to lower the peak of a moderate Mississippi flood occurring in 1929 (when the flood did not overtop the inner levees and had peaks of short duration and hence of small volume), by storing only a relatively small portion of the peak of the flood, if one only knew just exactly when the peak was to occur, how high it would be, and just exactly how to skim off the right amount of the peak and no more. Kimball admitted that this was purely an arithmetical computation made after the flood, which, apart from the question of the practicability of providing, or the availability of, facilities which could be operated in such a manner, required none of the prescience which would have been necessary to accomplish this astounding perfection by action worked out in advance of, or concurrently with, the flood. (Kimball R. 1876-7; Floyd R. 1901-2.)

sideration but also inconsequential in character. These floodways were not only flooded in a state of nature, but flowage rights have been or are being purchased under the Plan by the government and in any case they are only used once in ten or fifteen years with relatively small damage. (Kelly R. 1367; Clemens R. 1669-72; Okey R. 1931; Add. Fdg. 48, R. 679.)

As *General George B. Pillsbury, then Assistant Chief of Engineers,* said when testifying before the Committee on Military Affairs, House of Representatives, 74th Congress, 1st Session, with reference to any claimed flood benefits which might be anticipated from the construction of the TVA power dams, "*the effect on the Mississippi would be measured in inches and fractions of an inch in a high flood.*" And when pressed further, General Pillsbury said that *the construction of the TVA dams on the Tennessee River would not in his opinion "have an appreciable effect on the flood waters of the Mississippi.*" (Comp. Ex. 365†, p. 305.)[1]

(4) The creation of the water power by TVA is not, and will not be, an exercise of the war power.

The TVA projects constructed and proposed to be constructed on the tributaries and to some extent those upon the Tennessee River above Wilson Dam increase the firm capacity of Wilson Dam for power purposes. (Fdgs. 72, 74, 89, 90, 91, 92, R. 617-620.) The appellees contended below, and the trial court seems to have thought,

---

[1] To the extent that Fdgs. 62, 63, 65, 66 (R. 613-4) state or imply that the flood protection works now nearing completion on the Mississippi are inadequate or that the TVA projects on the Tennessee River and its tributaries will have any appreciable effect on flood heights on the Mississippi, they are bare conclusions unsupported by findings of essential underlying facts or by evidence, are contrary to the clear weight of the evidence, and are based upon an erroneous conception of law. (See p. 128, *infra*.)

that the construction of Norris Dam was an exercise of the war power because it increased the firm power capacity of Wilson Dam. (Opinion R. 559.) Unless these findings may be regarded as having some bearing upon this issue, as we think they may not, there is no finding and no evidence to support any contention that the TVA Unified Plan is an exercise of the war power. The last Annual Report of TVA discloses that the maintenance of the idle nitrate plants at Wilson Dam is the only alleged national defense activity of TVA. (Def. Ex. 154°, p. 108.)

The entire amount of power produced or to be produced by TVA (except a negligible quantity used for the manufacture of fertilizer at Wilson Dam and presumably temporarily for dam construction (Karr R. 2222; Def. Ex. 147)) is to be transmitted, distributed and sold *for domestic, commercial and industrial uses in displacement of the facilities and businesses of the appellants and other existing utilities.* (See pp. 86-89, *infra.*) This does not result in any net increase in the electric facilities or power supply of the nation.

D. THE EXTENT, LOCATION AND NATURE OF APPELLANTS' PROPERTIES AND BUSINESSES.

The appellants are 16 public utility corporations engaged in supplying electricity to the public in territories in which the TVA is offering, or upon the completion of the TVA Unified Plan will offer, electricity for sale in quantities unlimited in relation to the available market. All, or a substantial part, of the service or market area of each appellant lies within 250 miles of the electric grid system or power pool which will be created under the TVA Unified Plan—a plan which is only a stage in the hydroelectric development authorized by the statute. (See Maps Comp. Exs. 7,* 12,* 27,* 29,* 33,* 37,* 41,* 45,* 49,* 74,* 82,* 89,* 101,* 327*; Fdgs. 1, 6-23, R. 585-598.) The appel-

lants have investments in property devoted to public service of more than $600,000,000. They have securities outstanding, exclusive of common stock, in the amount of more than $400,000,000. (Fdgs. 6-23, R. 585-598.) They have 11,000 miles of transmission lines and approximately 22,000 miles of distribution lines. They have more than 750,000 customers in 2650 communities. They sold approximately 5,000,000,000 kilowatt-hours of electricity in 1936. Approximately 75 per cent of their sales in kilowatt-hours are made to industrial consumers. They have more than 16,000 employees. In 1937 they paid approximately $16,000,000 in taxes to Federal, State, County and other local governments.[1]

The States in which they are rendering electric service are Tennessee, Mississippi, Alabama, Georgia, North Carolina, South Carolina, Virginia, West Virginia and Kentucky, which include all of the States of which any part lies in the Tennessee River basin. (Fdgs. 6-23, R. 585-598; Comp. Ex. 327.*) They are all engaged in the *local intrastate business* of distributing electricity, *and each is subject to State regulation as to its rates and service.* (Fdgs. 1, 26, R. 585, 599; Comp. Ex. 2, R. 2450.) Each of the appellants maintains and operates its utility system and facilities under State franchises granted pursuant to regulatory statutes of the State or States in which it carries on its business. (Fdgs. 1, 6-23, R. 585-598; Comp. Ex. 2, R. 2450.) The privilege of constructing, maintaining and operating such facilities has been granted to each of appellants subject to numerous restrictions, obligations and public duties imposed by State statute. (For illustration, see App. pp. 39-46.) Each of appellants also holds franchises (conceded for the purpose of this suit to be nonexclu-

---

[1] Fdgs. 6-23, 25 (R. 585-599); Comp. Exs. 6, 10, 15, 17, 20, 23, 24, 28, 30, 31, 35, 36, 38, 40, 46, 47, 48, 55-60, 67, 68, 69, 73, 76, 80, 81, 84, 85, 86, 95, 96, 97, 100, 102, 104, 500.

sive) for the distribution and sale of electric energy within the corporate limits of the various municipalities and, in some instances, within the counties where it operates. (Fdg. 28, R. 599; Comp. Ex. 3, R. 2453.)

The businesses of the appellants have been built up over a long period of years.[1] Their facilities have been developed to meet the needs of the particular markets which they respectively serve. In that process of development, as illustrated by Complainants' Exhibits 54* and 336*, the properties of each of the appellants have become integrated units so that the loss of any part of their respective markets would seriously affect the economy and efficiency of the service to their remaining markets. (R. 830; 1106-1108.) Many of the appellants operate as adjuncts to their electric businesses such enterprises as transportation systems, water systems, ice plants and telephone systems. For many years these businesses have been operated under the same management with the electric operations as a single operation and the severance of the electric business from such other businesses would have an adverse effect upon such appellant. (Fdgs. 6, 8, 10, 11, 20, 21, 22, R. 585-597.)

Each of the appellants has played an active and important part in promoting and developing the economic growth of the territory which it serves. (Add. Fdg. 124, R. 708; Stanley R. 934-940;[2] Comp. Ex. 182*.) Not one of these companies has ever failed to supply the demands and requirements of the markets in which it operates. (Fdg. 116, R. 627.) The facilities of the appellants have been designed and constructed to permit extensions and provide

---

[1] Fdgs. 6-23, R. 585-598; Comp. Exs. 10, 15, 23, 28, 30, 35, 38, 46, 55-63 inclusive, 76, 84, 85, 96, 104; R. 771-772, 787-788, 809, 822, 829-830, 846, 856, 885-886, 934-940.

[2] After part of this line of testimony had been given, the testimony concerning the Alabama Power Company was at the suggestion of the court accepted as typical. (R. 936, 965, 972.)

for future growth in business (Fdgs. 6, 8, 13, 16, R. 586-593), and each of the appellants has aggressively sought to stimulate and has stimulated the demand for and use of electric power in the territory which it serves both on the part of existing customers and on the part of potential customers. (Add. Fdgs. 124-127, R. 708-709; R. 772-3, 788, 796, 856, 934-940; Comp. Exs. 182*, 183*, 184*.) Each has maintained a department with the duty, among other things, of securing the location of new industries and businesses in its territory. (Add. Fdg. 125, R. 708; 935-936; Comp. Ex. 182*; R. 773, 778.)

The evidence is uncontradicted that in the territory served by the appellants there is no substantial unattached electric power demand. (Fdgs. 117-119, R. 627-8.) While there are a few industrial plants which still manufacture their own power, most of these do so because of the fact that they require steam in processing operations or because they have fuel by-products from which power may be produced at little or no cost, and not because central station electric service is not available. (Fdg. 117, R. 627-8.) The only unattached domestic demand for electric service beyond the reach of existing lines of the appellants, is of such a character,—for the most part widely scattered farm dwellings,—as not to justify line extensions at the present time, either under minimum requirements of applicable State regulations or *under the minimum requirements adopted by TVA in its rural development program.* (Add. Fdg. 106, R. 699-700; R. 978, 991, 1007, 1016, 1021, 1027, 1035, 1053, 835, 842; Offer to Prove R. 1001.) However, rural business is a comparatively new and gradually growing field; and has been and is assiduously cultivated by the several appellants. (Add. Fdg. 129, R. 709; 937-940; Comp. Ex. 184*.)

E. REVIEW OF THE FACTS RELATING TO THE METHOD OF DISPOSAL OF THE WATER POWER AFTER CONVERSION INTO ELECTRICITY.

(1) The execution of the TVA Unified Plan will establish the United States in the electric utility business with a virtual monopoly throughout the State of Tennessee and large parts of eight neighboring States.

The TVA Unified Plan includes ten high dams and hydro-electric plants [1] (constructed and to be constructed) all of which are, or will be, interconnected by high tension, heavy duty transmission lines so as to create one vast grid system or power pool. They will also be interconnected with Wilson Dam so as to bring into the TVA power pool not only the capacity of Wilson Dam as constructed under the National Defense Act of 1916, but also the increased capacity to be provided at Wilson Dam under the TVA Unified Plan. (R. 2124; Add. Fdg. 107, R. 700; Comp. Ex. 116†, p. 477; Fdgs. 179, 180, R. 640.) This TVA power pool will extend geographically from Hiwassee and Fontana in North Carolina on the *east* to the Mississippi River on the *west,* and from Guntersville and Wheeler in northern Alabama on the *south* to Gilbertsville near the Ohio River and Norris near the boundaries of Kentucky, West Virginia and Virginia on the *north.* (Add. Fdg. 107, R. 700; Comp. Ex. 327*; Def. Exs. 136A*, 137*.) The court excluded as immaterial an official TVA Press Release (Comp. Ex. 834, R. 3763, 3766, excluded), in which the appellees described their power development as follows:

> "The TVA *has under way,* as you know, a comprehensive program for the development of the power resource(s) of the Tennessee River and its tributaries.

---

[1] Gilbertsville, Pickwick Landing, Wheeler, Guntersville, Chickamauga, Watts Bar, Coulter Shoals, Norris, Hiwassee and Fontana.

No more ambitious program of hydro-electric development has ever been actually undertaken in this country."

"We *are making provision* for one of the largest hydro-electric developments in the world, with a potential three million horse power available. We are expending, and expect to expend, millions upon millions of dollars in construction activities, *all looking toward the development of more and more power.*"

This grid system or power pool may be tapped at any point so as to draw upon the whole reservoir of power (Add. Fdg. 107, R. 700; Moreland R. 1452; Thomas R. 2125), and consequently the area of potential distribution is much greater than the area of the grid system. In the present state of the art it is commercially feasible to transmit electricity for approximately 250 miles, so that it will be practicable to transmit the electricity to be generated by the TVA to any point within 250 miles of any of the dams included in such electric grid system or power pool. (Add. Fdg. 110, R. 700; Sporn R. 1260; Moreland R. 1452; Dr. A. E. Morgan, Comp. Exs. 109†, p. 187, R. 2641; 114†, p. 525, R. 2685.) While economy would suggest that the electricity should be disposed of as close to the grid system or power pool as possible in so far as the market is able to absorb the power, it is plain that any area within a radius of 250 miles of any such dams is threatened with invasion by TVA so long as any of the TVA power remains unabsorbed. (Moreland R. 1452-3, Offer to Prove, R. 1483-5.)

Even in an extreme low water year, as repeatedly reported to the Congress by the TVA, this hydro-electric system will have a firm capacity of 660,000 kilowatts [1] at 100

---

[1] Some of the findings submitted by appellees and signed verbatim by the majority of the trial court (Fdgs. 38, 40, 43, 230, R. 602-3, 650) omit reference to the Fontana project and may be urged as implying that Fontana is not part of the officially announced TVA construction program which because of

(Continued on page 67)

per cent load factor and of 1,100,000 kilowatts at 60 per cent load factor,[1] and will be capable of producing 5,780,000,000 kilowatt-hours of firm energy and 1,880,000,000 kilowatt-hours of secondary energy annually. (Add. Fdgs. 7, 11, 12, 13, 107, R. 672-3, 700; Kurtz R. 1215; Comp. Exs. 328°, p. 62; 115†, p. 279, R. 2697.) In a typical water year this huge federal utility will be capable of producing 10,000,000,000 kilowatt hours of energy per year (Add. Fdg. 14, R. 674; Kurtz R. 1216-17), and the uncontradicted estimate is that there will actually be produced for sale in a typical water year 7,670,000,000 kilowatt-hours of electrical energy. (Moreland R. 1449; Comp. Ex. 509, R. 3350.) This

[1] The typical load factor of large public utilities operating in the area where TVA has commenced and plans to expand its business is 60 per cent. (Kurtz R. 1212; Comp. Ex. 116†, pp. 402, 468, 515, R. 2726A.)

(Continued from page 66)

its very magnitude covers several years and involves the initiation of projects on a staggered construction schedule. The absence of any basis for such a contention is sufficiently shown by the fact that the Fontana project was again included with definite dates for initiation and conclusion of construction in the construction schedule officially reported by TVA to the Congress in the midst of the trial of this suit. (Def. Ex. 153†, p. 948; Add. Fdg. 8, R. 673.)

Another finding similarly submitted by the appellees and signed verbatim by the majority of the court (Fdg. 94, R. 621) purports to set forth the firm power capacity of certain TVA dams (not mentioning Fontana and Gilbertsville) without including the power capacity which will be added to the system by the Fontana and Gilbertsville projects, and without including a part of the power installations which the TVA Unified Plan provides will be added to the power installations that are now under way at other dams. Such computations, standing alone, in a suit to prevent irreparable damage from threatened acts are both insufficient and irrelevant. Except to the extent that such findings do have some relation as representing an admittedly incomplete stage of this federal development, the majority of the trial court failed or refused to make any findings upon the facts stated in this sub-section and essential to the determination of the scope of the enterprise, its effect on the reserved powers of the States and the rights of the people and the extent of the competition with which the appellants are threatened.

is exclusive of steam generating plants now owned or which may be constructed or acquired under the Act. TVA has estimated that the cost of the TVA Unified Plan, excluding Wilson Dam, will be $473,000,000 (Add. Fdg. 15, R. 674; Comp. Ex. 116†, p. 403, R. 2700A), and that the annual gross income from its power operations will be $23,000,000. (Comp. Ex. 115†, p. 279, R. 2697.) The foregoing estimate of cost includes nothing for the huge transmission system which will be necessary to market this power and according to the estimate of Professor Moreland, which was excluded, this would amount to more than $116,000,000. (Comp. Ex. 505, R. 3344, excluded.)

Something of the mammoth size of the enterprise in which the United States is attempting to embark under the statute even when measured by the TVA Unified Plan (which is far less than the sweep of the statute and includes none of the power to be developed at additional sites for which TVA has already requested appropriations for exploratory work) appears from the following facts. In 1936 the total amount of electricity, *both firm and secondary*, generated for public use by public utilities was only a little over 1,000,000,000 kilowatt-hours *in the entire State of Tennessee*, only about 3,700,000,000 kilowatt-hours *in the entire States of Tennessee, Alabama and Mississippi*, and only about 9,300,000,000 kilowatt-hours *in the entire States of Virginia, North Carolina, Georgia, Kentucky, Tennessee, Alabama and Mississippi*,—the seven States of which any part lies in the Tennessee River basin. (Add. Fdg. 108, R. 700; Newton R. 1418-19; Comp. Ex. 486, R. 3329; Moreland R. 1451.) Large parts of five of these seven States lie more than 250 miles from the great electric grid system or power pool which will be created by the TVA Unified Plan, and hence beyond the area of practical distribution of the TVA power. (Comp. Ex. 327*.)

Further, in 1936 the *total sales* of electricity by utilities for consumption within the area lying within 100 miles

of any of the dams included in the TVA power system were only 3,660,000,000 kilowatt-hours. The *total sales* in the same year within the area lying within 150 miles of any of such dams were only 7,160,000,000 kilowatt-hours. (Add. Fdg. 109, R. 700; Comp. Ex. 327*; Moreland R. 1451; Comp. Ex. 499.) These sales in each instance *include both firm and secondary power.*

Something further of the size of the TVA electric system resulting from the TVA Unified Plan appears from the following facts. The present transmission system of the TVA Unified Plan consists of approximately 1500 miles of transmission lines and 69 substations purchased, constructed, under construction or authorized for construction.[1] (Hapgood R. 2146; Def. Ex. 136; Def. Ex. 153†, pp. 987-991; Fdg. 185, R. 641; Add. Fdg. 86, R. 687.) *This, however, is only about 10 per cent of the transmission lines which will be necessary to complete the vast federal electrical system included in the TVA plan.* The testimony is uncontradicted that a transmission system of from 12,000 to 15,000 miles will be required to market the electrical energy which will be produced by the current TVA Unified Plan. (Add. Fdg. 112, R. 701; Moreland[2] R. 1453.) In comparison, the total mileage of transmission lines of the 18 companies, which were parties to this suit at the time of trial, is only approximately 11,000 miles; and this figure includes their transmission lines in large areas lying more than 250 miles from the TVA dams and hence beyond the range of practical transmission. (Moreland R. 1453-4;

---

[1] As at October 15, 1937, the total mileage of all kinds of lines purchased, constructed, under construction and authorized for construction by TVA was 4827. (Def. Ex. 136; Fdgs. 170, 174, 175, 179, 183, 187, 188, 194, R. 638-642; Hapgood R. 2160.)

[2] Edward L. Moreland: Senior Member, Jackson & Moreland, Consulting Engineers, Boston and New York; Head of the Electrical Engineering Department of Massachusetts Institute of Technology. (R. 1447-9.)

Comp. Exs. 500, 10, 15, 28, 30, 35, 38, 47, 58, 59, 60, 84, 85, 96, 104; Fdgs. 6-23, R. 585-598.) The total mileage of transmission lines (apart from TVA transmission lines) in the entire State of Tennessee is only a little over 2,000 miles. (Comp. Ex. 500, R. 3333.)

(2) The appellees have adopted and are carrying out a systematic program to take over the markets and businesses of the appellants by direct inducements offered to the consumers of electricity throughout the territory served by appellants.

The first step taken by the appellees to acquire a market for the tremendous pool of power to be developed under the TVA Act was the adoption and announcement, on August 25, 1933, of the TVA Power Policy. This Power Policy was reported to Congress in the First Annual Report of TVA (Comp. Ex. 113°, pp. 22-24, R. 2681-3), and is an administrative interpretation of the act as well as a definite declaration of the purpose of the appellees to engage in the electric power business and to bring about public ownership of distribution facilities for the distribution of TVA power.[1]

---

[1] This Power Policy is set forth at length in Comp. Ex. 113° and in Add. Fdg. 90. (R. 688-9.) The trial court excluded, as irrelevant, incompetent and immaterial, an authenticated official TVA Press Release by which this Power Policy and the program for the TVA electric power business was publicized throughout the territory in which appellants operated. (Comp. Ex. 633, excluded, R. 3487.) The trial court subsequently received a resolution of the TVA Board (Def. Ex. 29, R. 4061) purporting to rescind this Power Policy but such resolution or purported rescission was never reported to the Congress nor disclosed to the public until it was offered in the trial of this cause; and the evidence clearly establishes that the program set forth in the Power Policy as originally announced, although not a complete statement of all of the things that TVA has sought to accomplish, has been, and is being aggressively pursued. Nevertheless the trial court, contrary to all of the facts adduced at the trial, found that this Power Policy was never put into effect. (Fdg. 215, R. 647.) For discussion of additional material evidence on this subject excluded by the court, see pp. 219-225, 229-233, *infra*.

Immediately following the announcement of its Power Policy and without any determination of cost factors, which were then indeed unascertainable, on September 14, 1933, the appellees adopted and announced the TVA rate schedules, including a schedule of wholesale rates to be charged municipalities and cooperatives[1] and a system of schedules embodying retail rates to be collected by municipal or cooperative "distributors" and to be incorporated in all contracts made by TVA with such distributors. (Add. Fdg. 111, R. 701; Comp. Ex. 113°, p. 34; Comp. Ex. 634, excluded, R. 3490.) Separate schedules of rates to be collected by such distributors were prescribed by TVA for residential customers, commercial customers and industrial customers.

While the trial court excluded evidence to show that these rate schedules to be charged by TVA distributors were and are between 25 and 60 per cent lower than the comparable rates fixed by the State regulatory bodies in the regulation of the businesses of the appellants (Offers to Prove, R. 949, 972; Comp. Exs. 192, 198, 339, excluded, R. 3002, 3007, 3073), *counsel for the appellees conceded at the trial that TVA rates, in all classes of service, are "substantially lower" than existing rates of any of the appellants.* (Fdgs. 120-123, R. 628; R. 943-4, 946.) The effect, and the manifest purpose, of the adoption and the repeated publication of these rates throughout the Tennessee Valley area long in advance of the construction of the dams, before plans or cost estimates could have been made and even before the number or location of any dams except Norris and Wheeler had been determined, was to promote a general demand for TVA power, to invite and solicit the cus-

---

[1] These cooperatives, which are non-profit associations, are sometimes designated as "Electric Membership Corporations" or "Electric Power Associations."

tomers and businesses of appellants and to promote public ownership of local electric facilities.

These schedules of rates to be collected by TVA distributors have been embodied in the TVA contracts,[1] the standard provisions of which were adopted and approved by the directors as early as October 16, 1933. (Comp. Ex. 575, R. 3389.) Such contracts fix the retail price to the consumer. (Add. Fdg. 96, R. 692. See "Resale rates" in any TVA contract, R. 2731.) They are in the nature of franchises granted by TVA to distribute TVA power subject to regulations and restrictions which make the distributing agent a mere bill collector for TVA.[2] They are the type of contract which a manufacturer of a generally advertised product might make with a territorial agent. (For a discussion of the provisions of the contracts, see pp. 206-209, *infra*.) The TVA contracts subsequently made with some of its distributors even go so far as specifically to require TVA to render without compensation accounting, legal and engineering assistance (Comp. Exs. 125-127, 928-930, R. 2857, 2858, 3976, 3981, 3982), and to foster and promote the increased use of electricity within the municipality.[3]

After adopting this Power Policy and the rate schedules and contract provisions, which form the basis of the TVA activities in acquiring the markets served by the appellants, the appellees proceeded to give them the widest

---

[1] These contracts are all in evidence. (Comp. Exs. 117-145, 196, 224, R. 2729-2888, 3004, 3026; Def. Exs. 144, 154°.) The terms of the contracts between TVA and municipalities and cooperatives are summarized in Add. Fdgs. 97-100. (R. 693.)

[2] In some instances even this function is performed by TVA under contracts to operate the property. (Comp. Exs. 176-180, R. 2938-50.)

[3] Comp. Ex. 117, contracts with Athens, R. 2732, Muscle Shoals, R. 2741, Pulaski, R. 2741, Amory, R. 2742, Okolona, R. 2749, New Albany, R. 2760; Comp. Exs. 126, R. 2857; 127, R. 2858; 928, R. 3975; 929, R. 3980.

possible publicity. A Publicity Bureau, an official department of the TVA, was created in 1933. (Comp. Ex. 113°, p. 56; Comp. Ex. 364, excluded, pp. 1982, 2022, R. 3101, 3103.) The court excluded evidence showing that through this department TVA has continuously issued "Press Releases" describing its power activities, its rates, the rapid expansion of its generating and transmission system, the acquisition of municipal and other customers, the success of these operations, the advantages of the uses of cheap electric power, the savings to consumers of TVA electricity and the alleged unreasonableness of state-regulated rates of private utilities. The effect of such Press Releases, and it is fair to say the manifest intention of them, has been to destroy the going businesses of the appellants by representing that TVA rates, fixed even without knowledge of TVA costs, constituted fair wholesale and retail rates and that the state-regulated rates of appellants and other privately-owned utilities are exorbitant and excessive.[1] This ruling of the court is discussed at pp. 219-225, *infra*.

---

[1] These TVA Press Releases are Comp. Exs., excluded, 633, 634, 779-902 incl., R. 1510, 3673-3925. The TVA power activities are described in Comp. Exs., excluded, 633, 789, 790, 797, 800, 805, 809-11, 824, 845, 861, 884, 780, 786, 802, 807, 808, 816, 817, 820, 823, 825, 827-30, 832, 833, 835-41, 853, 857, 866, 880, 882, 886-89, 892, 902; the TVA rates in Comp. Exs., excluded, 634, 801, 817, 865, 891, 800, 803, 813, 839, 846-8, 859, 863, 873, 883, 901; the rapid expansion of the TVA generating and transmission system in Comp. Exs., excluded, 788, 812-14, 831, 852, 856, 878, 897, 781, 784, 785, 791 806, 849-51, 854, 855, 863, 864, 867, 870, 885, 890, 893, 896, 898-900; the acquisition of municipal and other customers and success of those operations in Comp. Exs., excluded, 790, 796, 821, 826, 874, 875, 881, 794, 804, 818, 819, 858, 869, 871; and the advantages of cheap TVA electricity in Comp. Exs., excluded, 793, 803, 823, 834, 879, 842, 860, 874-6, 891, 894, 901. TVA Press Releases also represent that TVA rates include all legitimate costs and that the state-regulated rates of private utilities are excessive and the result of financial abuses and mismanagement. (Comp. Exs., excluded, 790, 799, 800, 815, 839, 843, 891, 842, 862, 868.)

In addition to this publicity with which appellees have filled the newspapers throughout the entire area and beyond, the appellees have published and widely distributed among customers of appellants illustrated booklets of TVA activities and rates,[1] such as Comp. Ex. 188, R. 2969, and Comp. Exs., excluded, 187°, 189, R. 2977, and 190 R. 2987; have circulated for use at public meetings, without charge, motion picture films illustrating TVA rural electrification activities (Comp. Ex. 918, R. 3936); have prepared and distributed without charge complete sets of blanks to be used in making rural surveys, including forms of application agreements for use of TVA power, (Comp. Ex. 918, R. 3934; and Comp. Exs., excluded, 391, 392 and 393) and as appellants *offered to show*, have prepared material for hundreds of magazine articles, as illustrated by Comp. Ex. 635, excluded, R. 3493-3508.

Appellants further *offered to show* that supplementing these activities, the TVA directors, department heads and other TVA representatives as part of their duties, have made public addresses and radio broadcasts advocating municipal ownership of electric distribution facilities and explaining TVA contracts, rates and sales policies, and have assisted in the organization and promotion of TVA rural cooperative associations. (Add. Fdg. 102, R. 698; see testimony and Offers to Prove, R. 1321-3, 1395-7, 1441-2,

---

[1] A fair sample of this is found in a widely distributed advertising pamphlet entitled "TVA Electricity Rates": "*Why TVA Electric Rates Are Low.* The TVA in its electric operations submits to all legitimate charges to which a private utility would be subjected. Its success in making available cheap electricity lies in the cost assumed by some private utilities which TVA does not pay. A few of these may be mentioned: The attempt to pay dividends on the $1,400,000,000 of write-ups exposed by the Federal Trade Commission; expensive campaigns to influence legislation; excessive fees to affiliated engineering and management companies, as well as the tremendous salaries paid to officers of both the holding companies and the operating companies." (Comp. Ex. 189, excluded, R. 2983.)

1327-8, 1324-6, 1358, 1359-60, 1439-40, 1360-1, 1361-2, 1086-8; Comp. Exs., excluded, 390, 817, 879, R. 3173, 3737, 3867.) These activities have constituted a continuous and systematic campaign. All testimony with reference to these activities was excluded by the trial court in a ruling which is discussed at pp. 229-233, *infra.*

In the promotion of their electric power business in rural areas the appellees, in many instances, have made surveys and constructed and operated distribution lines, the customers being later organized into a membership corporation to take over the title to such property and to purchase power under a standard TVA power contract. (Fdg. 134; R. 630.) In other instances purely dummy corporations have been organized by bringing so-called promoters to the TVA offices to execute contracts previously prepared. (R. 1338-9, 1344; Offer to Prove, R. 1356.) The methods employed by TVA in promoting its rural electrification development are described in its publication "The Neighborhood Plan." (Comp. Ex. 918, R. 3934.) As a result of these methods, at the time of trial TVA had contracts with eighteen membership corporations operating over 2700 miles of rural lines all of which with a few minor exceptions were constructed by TVA, the entire cost being provided from TVA funds or funds borrowed from Rural Electrification Administration,[1] (hereinafter referred to as REA). In some instances Civil Works Administration (hereinafter referred to as CWA) furnished labor for the construction of lines. (Comp. Ex. 570, R. 3382.) In all cases TVA supervises the financial, bookkeeping and engi-

---

[1] For TVA financing of lines see Fdg. 194, R. 642; Fdg. 133, R. 630; Comp. Exs. 162-175 inclusive, R. 2895-2938; Def. Ex. 136, Table E, R. 4184A; for construction of lines with REA funds see Comp. Exs. 523, R. 3359; 529, R. 3360; 536, R. 3364; 537, R. 3365; 538, R. 3366; 540, R. 3367; 543, R. 3368; 545, R. 3370; 546, R. 3371; 549, R. 3372; R. 1518, 1519; 408, R. 2328; 385, excluded, R. 3158.

neering operations of such membership corporations. (Add. Fdg. 103, R. 699; Comp. Exs. 398-406 incl., R. 3201-3238.)

In the industrial field no standard rate was or has been adopted for industrial consumers such as Monsanto Chemical Company, the Aluminum Company of America, Victor Chemical Company, and other like customers with which TVA has since made long term contracts. (Comp. Ex. 118, R. 2828; Def. Ex. 154°, pp. 309, 313, 192, 302, 315.) Contracts of that type are apparently made upon the basis of whatever is necessary to take the business away from privately-owned utilities.[1]

(3) TVA has procured the cooperation and assistance of PWA and REA in financing and promoting the TVA Power Program.

The trial court made no findings on this subject. In the execution of the TVA Power Program, TVA has utilized

---

[1] Something of the character of this competition is illustrated in the case of the Monsanto Chemical Company, which is now being supplied by TVA. The Monsanto Chemical Company purchased its power requirements for its phosphoric acid operations from appellant, the Alabama Power Company, the revenue from which business amounted to $387,000 per year. (R. 956.) Upon the removal of the phosphoric acid operations of such Company to Columbia, Tennessee, appellant, The Tennessee Electric Power Company, entered into negotiations with Monsanto Chemical Company to furnish it with 50,000 kilowatts of power at its Tennessee plant. After the terms of the proposed contract had been agreed upon and The Tennessee Electric Power Company had offered to secure performance by depositing $1,500,000 of its First Mortgage Bonds, the Monsanto Company declined to execute the contract (Willkie R. 1503-4; Add. Fdg. 117, R. 704) in a telegram which stated:

> "*Due to the unfortunate competitive conditions surrounding The Tennessee Electric Power Company,* our directors are unwilling to hazard a several million dollar investment whose success is entirely dependent upon the continuity of its power supply *at contract rates which we believe are insecure* without a guarantee from the Commonwealth & Southern." (Comp. Ex. 628, R. 3477.)

other agencies of the Federal Government. (Add. Fdg. 135, R. 711.) The aggregate amount which the Federal Government has contributed or agreed to contribute through the Public Works Administration (herein referred to as PWA), to municipalities for the construction of competing systems *to distribute TVA power* amounts to $13,995,883 of which $7,721,314 *represents an outright gift or subsidy.* (Def. Ex. 153†, p. 1009; Comp. Ex. 484, R. 3323, 3327.) Of all the cities having power contracts with TVA, which prior to the advent of TVA were served by one or another of the appellant companies, only two have not received financial aid from PWA, and those two were cities which already owned their distribution systems and purchased power at wholesale from one of the appellants.[1] *The TVA contracts with municipalities require the municipality to use all reasonable diligence in acquiring a distribution system by construction or purchase.* (Add. Fdg. 97, Sec. (b), R. 693; See "Acquisition of System" in any contract, R. 2803.)

At the time of the trial there were twelve other cities in Alabama, Mississippi and Tennessee, all being served by one or another of the appellant companies, which had voted to acquire municipal distribution systems for distribution of TVA power and for that purpose had been granted loans and gifts by PWA. (Add. Fdg. 114, R. 702; Comp. Ex. 484, R. 3322.) Although TVA lists no contracts with any of these twelve cities, obviously PWA had received assurances from TVA which it regarded as sufficient basis for making these loans and grants. PWA announced that these loans and grants were made for the construction of distribution systems to distribute TVA power; and the projects include no generating facilities. (Comp. Exs. 484, R. 3322;

---

[1] Add. Fdg. 114, R. 701-2; Comp. Ex. 484. R. 3322; Fdg. 205, R. 645; Comp. Exs. 420, R. 3251; 422, R. 3270; 427, R. 3276; 438, R. 3283; 441, R. 3286; 460, R. 3305; 471, R. 3314, 473, R. 3315; 475, R. 3315; 478, R. 3316; and 466, excluded, R. 3312.

485†.) In the case of Bessemer and Tarrant City, Alabama, PWA, acting in cooperation with TVA, refused to approve their applications to include a steam generating plant in the municipal projects and required these cities to eliminate generating facilities from their projects and take TVA power as a condition of obtaining the federal loan and grant. (Comp. Exs. 442, 444, 449, R. 3286, 3290, 3300; Comp. Ex. 446, excluded, R. 3295.)

The aggregate amount which the Federal Government through REA has loaned or agreed to lend to non-profit membership corporations for distribution systems *for use of TVA power* at the date of the trial exceeded $1,400,000.[1] Director Lilienthal in the Hearings on the Second Deficiency Appropriation Bill for 1937 (Comp. Ex. 116†, p. 485, R. 2720) stated: "*We have a very cooperative arrangement with REA* by which they are furnishing by far the bulk of the financing through this area." (See also Dr. A. E. Morgan, Comp. Ex. 116†, p. 614; Add. Fdg. 135, R. 711.)

Appellants in addition *offered to prove* by correspondence between TVA, PWA and REA and by PWA and REA press releases and other documentary evidence[2] that the activities of these federal agencies in assisting in the development of a market for TVA power were an integral part of a definite National Power Policy to promote municipal ownership and regulate the electric utility industry, and the ruling of the trial court in excluding such proof is discussed at pp. 233-235, *infra*.

---

[1] Comp. Exs. 536, R. 3364; 537, R. 3365; 538, R. 3366; 540, R. 3367; 543, R. 3368; 545, R. 3370; 546, R. 3371; 549, R. 3372; 550, R. 3372; 551, R. 3373; 552, R. 3374; and 565, R. 3378.

[2] R. 1402-8, 1515-16; Comp. Exs., excluded, 418, R. 3246; 428, R. 3276; 429, R. 3278; 446-450 incl., R. 3295-3301; 461-465 incl., R. 3305-3312; 469, R. 3314; 480-83, R. 3316-21; 637-648 incl., R. 3509-3554; 683-685 incl., R. 3599-3605; 385, R. 3158; 770-773 incl., R. 3659-3663; 776-778 incl., R. 3667-3673.

The alliance and cooperation between TVA, PWA and REA, disclosed by this evidence, represent a concentration of federal support to the promotion of public ownership, the federal control and regulation of electric power operations, the promotion of the power business of TVA and the destruction of the businesses of the appellants.

(4) In executing their Power Program, the appellees have contracted to sell and are now offering for sale electric power and electric service at rates far below the actual cost.

The trial court made no findings on this subject and excluded as immaterial the appellants' offer to prove that without capitalizing operating losses and deficits during the period of construction and business development, and assuming the sale of all the power to be produced by TVA under the TVA Unified Plan at TVA rates, the TVA "yardstick rates" will result in an annual operating deficit of more than $9,000,000 without taking into consideration either the cost of, or the revenue derived from, power produced at Wilson Dam at its maximum capacity as constructed under the National Defense Act of 1916.[1] (See Moreland, Offer to Prove, R. 1463-70 and statistical data in Comp. Exs. 504, 505, 506, excluded, R. 3343-3347.) This operating deficit amounts to approximately 39% of the

---

[1] This loss is based upon actual out-of-pocket expense and does not take into consideration the subsidies and advantages such as substantial immunity from taxation, use of franking privileges and use of Government credit. No figures are available for the extent of many of these omissions from the "yardstick rates" which would be necessary to make them comparable to utility operation, but appellants offered to prove that the items for which figures are available would increase the annual operating loss to $19,516,000. The loans or gifts of federal funds by PWA and REA to wholesale contractors for the distribution of TVA power are likewise not considered. (Comp. Ex. 506, excluded, R. 3346 and Moreland, Offer to Prove, R. 1463-70.)

ultimate maximum annual revenue, which means that nearly 30% of the actual cost of every kilowatt-hour of power sold must be paid for by taxation and not by the consumers. For a discussion of the relevency of this evidence and its exclusion by the trial court, see pages 236-237, *infra.*

Whether purposeful or inadvertent, the effect of this is to accelerate the establishment and expansion of the TVA power business, the establishment of the policies and purposes of the TVA Act and the elimination of appellants from the field.

(5) Under the TVA Unified Plan, TVA will regulate its own rates, the rates of distributors of TVA power and all other local intrastate electric rates, including those of appellants.

TVA regulates and fixes its own rates. (Add. Fdg. 132, R. 710; Comp. Exs. 322-325; see also Conclusion 40, R. 661; and pp. 163-164, *infra.*) It also regulates the retail rates of distributors of TVA power for terms of 20 to 30 years. (See "Terms of contract," "Resale rates" and "Schedules of rates" in any TVA contract with its distributors, R. 2731; 2733-5; 2751-5; Add. Fdgs. 96, 97(e), 100(e), R. 692, 693, 697; Fdgs. 121, 221, R. 628, 648; also pp. 204-209, *infra.*) One finding of the majority of the trial court, in the nature of a conclusion of law, seems to imply a view that the fixing and control of retail rates by TVA over periods of from 20 to 30 years (in accordance with the TVA Act) through a system of contracts, is not a regulation of such rates. (Fdg. 222, R. 649; cf. Conclusion 45, R. 661.) However, that these retail rates are fixed and controlled by TVA is plain on the face of the contracts. The regulation of such rates is discussed at pages 163-175, *infra.*

However, the purpose and effect of the TVA Unified Plan is not limited to the regulation of local electric rates of distributors of TVA power but, like the TVA Act, is

designed to regulate, and in fact will regulate, the local electric rates of other utilities, including the appellants.[1] Under the TVA Unified Plan, TVA will, *in an extreme low water year,* generate for sale more than twice as much electricity, and *in an average water year* nearly three times as much electricity, as was sold in 1936 by utilities in the entire area lying within 100 miles of any of the dams included in the TVA power system. *In an extreme low water year,* it will generate for sale substantially more electricity than was sold by all utilities in 1936 w thin an area lying within 150 miles of any of such dams. (See pp. 66-69, *supra.*) This electricity will be offered for sale at rates "substantially below" the state-regulated rates of appellants in this limited market now adequately served. (Moreland R. 1451-3; Fdgs. 116-119, R. 627-8.)

While the trial court excluded as immaterial evidence offered through experts in the operation of utilities that the operation of the TVA Unified Plan will in fact regulate the rates of the appellants (Offers to Prove, Lefferson R. 1412-16; Newton R. 1419-22; Stanley R. 949-50), the uncontroverted facts above stated show that the appellants will be forced to fix their rates at the level established from time to time by TVA. (Opinion R. 555; Ford R. 1127;

---

[1] This is in strict conformity with the appellees' interpretation of the TVA Act. This interpretation of the Act and purpose of the TVA Unified Plan has been repeatedly stated by the appellees in official Press Releases, excluded by the trial court as immaterial. Thus in an official TVA Press Release, the appellees stated in the words of Director Lilienthal: *"The power policy written into the Tennessee Valley Authority Act represents an attempt to regulate public utilities not by quasi-judicial commissions, but by competition."* (Comp. Ex. 815, excluded, R. 3732.) For similar interpretations of the Act by the appellees and statements of their purpose in administering the Act, see Comp. Ex. 799, R. 3698; Comp. Ex. 796, R. 3691; Comp. Ex. 800, R. 3703; Comp. Ex. 790, R. 3683, all similarly excluded. Also see *TVA Directors' Minutes,* Comp. Ex. 708, excluded, R. 3640.

see pp. 163-175, 237, *infra*.) However, the trial court declined to make any finding of fact on this point, although requested to do so by appellants (Proposed Fdg. X E 20, R. 462), excluded competent and relevant evidence on the subject (see pp. 236-237, *infra*) and then concluded as a matter of law that there will be no regulation of the rates or businesses of the appellants or of other private utilities. (Conclusion 40, R. 661.)

(6) The execution of the TVA Unified Plan will supersede the State regulation of local electric rates and service.

The only findings of the trial court which in any way bear upon this issue are Nos. 26 and 27 (R. 599) which, so far as relevant, sustain the statement in the title of this subsection. (R. 559.)

As to regulation of rates: In previous sections it has been pointed out that, under the operation of the TVA Unified Plan, TVA will regulate its own rates, the rates of distributors of TVA power and the rates of other utilities, including appellants, operating in the States through which the huge TVA electric power system will extend. (See pp. 80-82, *supra*.)[1] Thus State regulation of local intrastate electric rates will be displaced by TVA regulation of such rates.

As to extensions of service: In the States of Tennessee, Alabama, and other States in which one or another of

---

[1] The trial court excluded as irrelevant evidence that TVA has expressly denied the power of a State to exercise any control over any of its rates or rate policies. This evidence consisted of a written statement filed with the Alabama Public Service Commission and signed by all three directors of TVA, in which TVA declined to submit for examination its cost books and records and stated: "*And since your Commission cannot directly determine the rates and rate policies of this national agency, it should not try to do this indirectly, by calling for testimony concerning matters clearly beyond your control.*" (Comp. Ex. 884, R. 3880-1, excluded.)

the appellant companies are now operating, the State Commissions have adopted regulations applicable to such appellants fixing the minimum requirements under which they may be compelled to construct line extensions to give service in areas not theretofore served. (Add. Fdg. 131, R. 710; Comp. Ex. 185, R. 2961; R. 835; 939; 972.) As pointed out at pages 88-89, *infra*, the result of actual and threatened competition by TVA is that privately owned public utilities in this area are unable to borrow money at reasonable interest rates, if at all, either for the purpose of refunding existing obligations or for the purpose of constructing new facilities to improve or extend existing service. This means the nullification in fact of State power to require or compel service extensions and plant additions or improvements. (Add. Fdg. 133,[1] R. 710.)

As to quality and continuity of service: The operation of the electric power businesses of the appellants has involved (and still involves) the development of new markets and the extension of service throughout the areas in which they have the right and the duty to serve under State franchises. (Add. Fdgs. 124-129, R. 708-9; Stanley R. 934-941; Comp. Exs. 182,* 183,* 184*; R. 772, 788.) This has required, on the part of each of the appellants, constant study of system planning, regular surveys of possible line extensions, promotion of new industries, continuous service to industrial, commercial and domestic consumers, promotion of electric power demand by sales of electric appliances, study and instruction in new uses for electric power by all classes of consumers, and necessarily an understanding of

---

[1] "The competitive activities of TVA in making it impossible for the complainant companies to reduce their fixed charges through refinancing and in making it impossible for them to procure new capital *interfere with and limit the power* of the State regulatory bodies to require the complainant companies to reduce their rates and extend or improve their facilities and service."

the local conditions in the territory being served.[1] The performance of all of these functions requires the development and maintenance of a large and efficient organization. These functions have been carried on under State supervision and have contributed to the economic growth and development of the States themselves.

The elimination of these functions is an inescapable consequence of the facts stated at pp. 86-89, *infra*. As there pointed out, the City of Knoxville *was* only a part of the market served by the Tennessee Public Service Company. The City of Memphis is only a part of the market served by the Memphis Power & Light Company. The City of Chattanooga is only a part of the market served by The Tennessee Electric Power Company. The execution of the TVA Unified Plan will not only take away the markets embraced within the artificial boundaries of these cities, which are the load centers and focal points of electric power distribution in the surrounding areas, but will require the appellants to reduce their rates to the level of the TVA subsidized rates in the areas which appellants continue to serve. Whether this will result in a complete breakdown of service in these surrounding areas not receiving TVA power depends upon whether any of the individual appellants can continue to operate under such conditions, and since the trial court declined to receive any evidence as to the subsidized character of the TVA rates (Moreland R. 1463-6; Comp. Exs. 504-506, R. 3343-7)

---

[1] Necessity for system planning. (Add. Fdg. 129, R. 709.) Regular surveys of possible line extensions. (Add. Fdg. 127, R. 709; R. 938, 976, 989, 1026, 1033, 1051, 1005, 1015, 1020.) Promotion of new industries. (Add. Fdg. 125, R. 708; R. 935, 773, 788; Comp. Ex. 182*.) Continuity of service. (Fdg. 116, R. 627.) Promotion of electric power demand. (R. 937-8, Comp. Ex. 183*.) Instruction in new uses for electric power. (R. 937-8.) Necessity for understanding local conditions. (R. 971.) The testimony of the Alabama Power Co. on these points was accepted by the trial court as typical of all the appellants. (R. 936, 965, 972.)

or as to the *extent* of the damages with which appellants are imminently threatened (Moreland R. 1480-5; Lefferson R. 1416-7; Newton R. 1424; Comp. Exs. 512-14, R. 3354-6), the trial court could not properly make any determination of that question. However, the undisputed facts appearing in the record establish that the execution of the TVA Unified Plan will seriously undermine, if not destroy, the ability of the States to enforce the obligation to render electric service, which state-regulated agencies must assume as a condition to their right to engage in the business at all, and will thus destroy the ability of the States to protect the economic needs of their citizens who have become dependent upon such service. (Add. Fdg. 134,[1] R. 710.)

The evidence hereinbefore reviewed shows that if anything remains of State regulation of the electric power business after the completion of the TVA Power Program, irrespective of the survival of some portions of the businesses now conducted by the appellants, it will be a small and degenerate vestige of the powers reserved to the States and the people under our Federal Constitution.

---

[1] "The carrying out of the Tennessee Valley Program to take over the business and markets now served by the complainant companies will necessarily, in the case of such complainant companies whose business and markets are so taken, destroy their ability to maintain the organizations which they have developed, their ability to perform the functions which they have heretofore and which they are now performing in providing adequate electric power service, and will destroy the ability of the States and political subdivisions in which such complainant companies are now operating to regulate and control the electric power rates and service in such areas or to protect the economic needs represented by industrial, commercial, and domestic electric consumers who are now being served by such complainant companies." (R. 710.)

F. THE EXECUTION OF THE TVA UNIFIED PLAN IMMINENTLY THREATENS EACH OF THE APPELLANTS WITH IRREPARABLE DAMAGE.

The trial court found that each of the appellants is threatened with substantial irreparable damage through the execution of the TVA Unified Plan.[1] (Fdg. 125; R. 628; Opinion R. 555.) The TVA Unified Plan will generate for sale in an extreme low water year twice as much power as was sold in 1936 by all utilities within the area lying within 100 miles of any of the dams included in the TVA power system and in an average water year substantially more than the total amount of power which was sold in 1936 by all utilities within the area lying within 150 miles of any of such dams. (See pp. 66-69, *supra.*) This power will be offered for sale at rates "substantially below" appellants' rates and in such a manner as to promote the statutory policy of having the local electric business carried on by public and non-profit organizations. The service or market area of each of the appellants lies wholly, or in large part, within the territory lying within 150 miles of the dams included in the TVA power system. (See pp. 61-64, *supra.*) The appellants are thereby threatened with the loss of their businesses and markets.

The TVA transmission lines, even as constructed to date, substantially duplicate the transmission facilities of the appellants in the State of Tennessee and are designed so that they may be readily extended to all of the principal load centers in the areas served by appellants. (See Maps, Comp. Exs. 333A,* 335A,* 332A,* 334*; Add. Fdg. 113, R. 701; R. 1103-1106.) The distribution lines already built

---

[1] In relation to damages Fdgs. 184, 186, 248, and 249, are bare conclusions not supported by underlying findings of essential facts or by evidence, and Fdgs. 106, 111, 151, 203-12, 216, 239-42 are based on an erroneous conception of law. (See pp. 199-201, *infra.*)

and serving TVA power have been constructed in the immediate vicinity of load centers now being served by appellants. (See Maps, Comp. Exs. 332-A,* 199,* 205*-210,* 326*; Add. Fdg. 122, R. 707.) These lines, all of which could be served by appellants without substantial changes in, or additions to, their present facilities (Add. Fdg. 119, R. 706; R. 1007, 1017, 1022, 1027, 1035, 1053, 978, 992), substantially restrict the normal growth of appellants' businesses and substantially impair the value of appellants' facilities designed and built to permit extension of service to new customers and territories at low increment cost as rapidly as the new business could be secured or the extensions of service justified. (Add. Fdg. 122, R. 707; R. 1109; 1007; 1022; 1027-8.) This duplication of appellants' facilities will increase as the TVA Unified Plan advances toward completion and causes and threatens loss of value of appellants' facilities.

The appellants are also threatened with great losses through TVA regulation of their rates. The trial court excluded evidence that the damage from loss of revenue which would result from TVA rate regulation, after making allowance for assumed increased customer consumption resulting from rate reductions, would exceed $21,000,000 per year. (Moreland, Offer to Prove, R. 1484; Comp. Ex. 514, excluded, R. 1127.)

At the present time TVA *is serving* six cities formerly served by one or another of the appellants. It has entered into *contracts to serve* seven other cities *which are now being served* by one or another of the appellants. (Add. Fdg. 114, R. 702; Def. Ex. 143, R. 4192.) It has *applications for service* from forty-one additional cities *which are now being served* by one or another of the appellants. (Add. Fdg. 115, R. 703-4; Comp. Ex. 116†, pp. 537-8.) In addition to these there are twenty-one cities which have

voted to acquire or construct municipal distribution systems to distribute TVA power. (Add. Fdg. 114, R. 702; Comp. Exs. 116†, pp. 536-7; 335A*, 191, R. 3001; R. 991, 795, 978, 804.) It also has contracts with eighteen "membership corporations" operating over 2700 miles of rural lines. (Add. Fdg. 92, R. 691.) Approximately 75% of appellants' businesses consists of industrial sales, and TVA already is serving many industrials, including some of the largest industrial consumers in the area. Manifestly, the loss of these markets will take away a very substantial part of the total gross income of the several appellants.

TVA has already entered into contracts to serve practically the entire territory of Memphis Power & Light Company. (R. 1126; Comp. Ex. 118, R. 2807-8; Fdg. 210, R. 646; Add. Fdg. 114, R. 702.) [1] TVA has entered into a contract to serve Chattanooga, which is the heart of the system of The Tennessee Electric Power Company and constitutes about 35 per cent of its load. (Comp. Ex. 129, R. 2859; R. 1106, 769.) TVA has entered into a contract to serve the city of Jackson which is the heart of the system of the West Tennessee Power & Light Company. (R. 480; Comp. Ex. 133, R. 2873.) Each of these appellants is obviously threatened with ultimate bankruptcy. (R. 1127.)

The testimony is uncontradicted that the threat of injury and destruction from TVA competition has caused great financial losses to each of the appellants, excepting Appalachian Electric Power Company, through inability to refinance outstanding securities at lower interest rates and

---

[1] At the time of trial TVA also had entered into a contract (Comp. Ex. 118, R. 2808) with Knoxville to serve practically the entire service area of Tennessee Public Service Company; and since this appeal was taken, this company has turned over its electric facilities to TVA, and its nominee, the City of Knoxville.

through inability to finance extensions at reasonable rates, if at all. (Add. Fdg. 123, R. 707-8; Frothingham [1] R. 1307-1310, 1319-20.)

G. THE DECISION OF THE TRIAL COURT.

The trial court in its opinion repeatedly states or implies that the Bill is based in whole or in part upon a charge of fraud. (R. 542.) With the possible exception of the misrepresentations charged to have been made by appellees in their efforts to further the TVA power business in competition with appellants, the Bill raises no question of fraud, unless it can be said that a charge that federal officers or agents are acting under an unconstitutional statute or in excess of statutory authority is a charge of fraud. If that be so, all constitutional cases are fraud cases.

The holdings of the trial court upon the issues, *as conceived and stated by it,* are:

First: That all of the acts of the appellees are authorized by the statute. In this holding the court ignores the only points on which appellants contended the appellees had exceeded the scope of the statute. (Cf. Opinion R. 555-8 and Point IV, pp. 224-225, 233-235, 236-237, *infra.*)

Second: That all of the appellants are threatened with future irreparable damage and that the constitutionality of the TVA Act must be determined. (Opinion R. 555.)

Third: That the water power will be constitutionally created. (Opinion R. 558-562.) This holding is based upon a misconception of the applicable law and upon a failure

---

[1] Francis E. Frothingham, then President of the Investment Bankers Association of America, with wide experience in the investment banking business. (R. 1304.) The trial court excluded as irrelevant other testimony showing this type of damage which was offered through Walter M. Robinson, an investment banker of Nashville, Tennessee, and Harry M. Addinsell, an investment banker of wide reputation and head of the First Boston Corporation. (See pp. 237-238, *infra.*)

to consider, or make any findings upon, essential facts. (See pp. 20-21, 37-38, *supra* and Point I, pp. 94-133, *infra.*)

Fourth: That the method of disposal of the water power is valid. (Opinion R. 562-5.) This holding also is based upon an erroneous conception of law and upon a failure to consider, or make any findings upon, essential facts. (See p. 143, *infra,* pp. 79, 82, *supra,* and Point II, pp. 133-190, *infra.*) The error is further aggravated by the holding that a citizen suffering irreparable injury from the operation of a federal statute regulating matters of intrastate concern may not challenge the act but that the act may only be challenged by a State. (Opinion R. 563.)

Fifth: That the charge of confederation between appellees and PWA has not been established. (Opinion R. 552-3.) The court made no findings on this subject. This result was reached by denying appellants the benefit of subpoena and the right to take depositions to prove the charge and by excluding, as immaterial, all evidence which the court recognized as bearing on the issue and by ignoring all pertinent evidence in the record. (See pp. 233-235, *infra.*) The court also failed to apprehend that the matters involved in this paragraph, as well as in paragraphs "*First*" and "*Fourth,*" were material and relevant as bearing upon the extent and imminence of the threat with which appellants are confronted and upon the steps which have been and are being taken to establish and place in operation the purposes and policies of the TVA Act and of the TVA Unified Plan.

Sixth: That the evidence does not establish that appellees have acted to force the sale of distribution systems of appellants at distress prices on threat of duplication with federal funds. (Opinion R. 544, 551.) Laying to one side the circumstance that this charge related to acts done in confederation with PWA and other federal agencies, the court's conclusion was reached by the simple process of

denying appellants the right of subpoena and the right to take depositions to support the charge (see pp. 216-217, 233-235, 238-240, *infra*) and of adopting the novel legal theory that a charge of threatened irreparable damage can only be established by proof that the damage has already been inflicted and the alleged wrong consummated. (Opinion R. 551-2.)

Seventh: That there is no proof of coercion of municipalities or cooperatives by TVA to take TVA power. (Opinion R. 553-4.) While the confederation between TVA and PWA did include the exercise of coercion on Bessemer and Tarrant City, Alabama, (evidence of which was ignored by the court), the court here misconceived or misstated the charge which was that appellees, in soliciting appellants' customers, had engaged in an aggressive campaign of soliciting municipalities and organizing cooperatives to use TVA power and of promoting the statutory policy of having the local electric business carried on by public or non-profit organizations. (See pp. 70-75, *supra*, 175-178, *infra*.) The court also excluded most of the evidence offered on this point, as immaterial (see pp. 229-233, 219-225, *infra*), but the record does nevertheless sustain the charge.

The trial court delivered its opinion several days before it filed an order purporting to adopt certain requested findings and conclusions by reference (R. 542, 566) and more than four weeks before it filed any formal findings and conclusions. (R. 542, 583.) Findings Nos. 1 to 28, describing the properties and businesses of appellants, were agreed upon between the parties. The majority of the trial court adopted (in nearly every instance verbatim) all the findings and conclusions submitted by appellees with the exception of Def. Proposed Fdg. 28 and Proposed Conclusions 62-64.[1] (R. 566, 490, 541.) The court required oral

[1] Cf. Order of January 25, 1938, R. 566, Fdgs. 29-251, R. 600-655 and Conclusions 1-62, R. 655-664, with appellees' Requested Findings and Conclusions, R. 477-541.

argument immediately after the close of the testimony and required that suggested conclusions and findings and all briefs should be submitted at the close of such argument (R. 1862, 1919, 2281-4, 2316, 2370-3), so that the appellants were precluded from commenting upon such findings or conclusions either in brief or oral argument. (Cf. *Morgan v. United States*, 304 U. S. 1.) These findings and conclusions are erroneous in the respects pointed out at appropriate places in the Statement of the Case and in the Argument. Judge Gore refused to adopt the conclusions of law submitted by appellees and made many additional findings of fact upon material issues upon which the majority had either failed or refused to make any finding. (R. 669-713.)

SPECIFICATION OF ERRORS.

Appellants urge each of the assigned errors[1] Nos. 1-42, 45-135, inclusive. (R. 715-759.) Without waiving or limiting any of said Assignments, more particularly the trial court erred:

1. In finding, concluding and decreeing that the water power being created and to be created by TVA is being and will be constitutionally created, and in failing to find, conclude and decree that such water power will not be created either as an incident to the exercise of the power to regulate interstate commerce or of the war or national defense power. (Assignments of Error 68-80, 104-113; see Point I, *infra*.)

---

[1] Assignments of Error Nos. 1-42, 45-67, inclusive, relate to errors in procedure and rulings on evidence. Many of the other Assignments relate to findings and conclusions which are deemed plainly immaterial or inapplicable and have been assigned and are preserved to avoid any technical question should any of them be claimed to amount to material findings or conclusions by implication.

2. In finding, concluding and decreeing that the method of disposing of the water power being created and to be created by TVA, both as provided in the TVA Act and as being carried out by the appellees, is valid, and in failing to find, conclude and decree that both the statutory and the administrative method of disposing of such water power is in excess of the powers of the Federal Government and in violation of the Fifth, Ninth and Tenth Amendments. (Assignments of Error 81-107, 112, 114-125, 129, 131, 133, 134; see Point II, *infra.*)

3. In finding, concluding and decreeing that the appellants are not entitled to sue to enjoin the acts complained of in the Bill. (Assignments of Error 91, 92, 98-103, 105b, 105c, 125-134; see Point III, *infra.*)

4. In failing and refusing to receive evidence upon, or to consider or decide the questions (a) whether the sale of electric power by appellees at rates below the cost of production, distribution and sale is prohibited by the TVA Act; (b) whether under the TVA Act the appellees are authorized to confederate with other federal agencies to take over the business of the appellants or to force appellants to sell their electric systems at distress prices on threat of having the value of such facilities destroyed by duplications through loans and gifts of federal funds; and (c) whether the TVA Act, properly construed, authorizes the appellees to engage in a systematic campaign of misrepresentation for the purpose, and with the necessary effect, of destroying and appropriating the going businesses of the appellants. (Assignments of Error 104, 105, 107, 117; see Point IV, *infra.*)

5. In numerous rulings on matters of evidence, matters of procedure and in the conduct of the trial which deprived appellants of a full and fair trial and constituted a denial to appellants of due process of law as a matter of

procedure. (Assignments of Error 1 to 42, 45 to 67; see Point IV, *infra.*)

6. In entering its final decree dismissing the Bill of Complaint and in failing to find, conclude and decree that the appellants are entitled to the relief prayed for in said Bill. (Assignment of Error 135.)

SUMMARY OF ARGUMENT.

In view of the detailed nature of the Index of Argument at the beginning of this brief, it is believed that a Summary of Argument is not necessary.

ARGUMENT.

POINT I.

THE WATER POWER BEING CREATED AND TO BE CREATED BY TVA IS NOT BEING, AND WILL NOT BE, CONSTITUTIONALLY CREATED, SO THAT THE FEDERAL GOVERNMENT (TVA) WILL ACQUIRE NO TITLE TO SUCH WATER POWER.

Appellees concede that TVA or the Federal Government may not legally produce or acquire title to the electricity except in so far as such electricity[1] is produced in the exercise of some constitutional power of the Federal Government. The principle was stated by this Court in *Ashwander v. Tennessee Valley Authority,* 297 U. S. 288, as follows:

---

[1] While the words "electricity" and "electric power" are sometimes used in this Section for brevity and convenience, the property with which we here deal, is not electricity but mechanical energy which is created by impounding water behind dams and which is generally known as raw water power. We do not here raise any question as to the manufacture of the raw water power or mechanical energy into electricity when and if it has been constitutionally created and has constitutionally become the property of the United States.

"* * * And the Government rightly conceded at the bar, in substance, that it was without constitutional authority to acquire or dispose of such (electrical) energy except as it comes into being in the operation of works constructed in the exercise of some power delegated to the United States." (loc. cit. 340.)

But the appellees seek to justify the creation of the electricity upon the grounds:

(a) That it is brought into being as an incidental result of an exercise of the power to regulate interstate commerce (Article I, Sec. 8, Clause 3); and

(b) That it is brought into being as an incidental result of an exercise of the war or national defense powers. (Article I, Sec. 8, Clauses 11, 12, 13, 14, 15 and 16.)

The appellants contend under the facts of this case, not only that the production of the electricity may not be justified upon either of the foregoing grounds, but also that the power scheme falls before the principle that Congress may not "in the execution of its powers, adopt measures which are prohibited by the Constitution," and may not "under the pretext of executing its powers, pass laws for the accomplishment of objects not entrusted to the Government." *McCulloch v. Maryland,* 4 Wheat. 316, 423; *Linder v. United States,* 268 U. S. 5, 17; *United States v. Butler,* 297 U. S. 1.

A.

The electricity will not be produced as an incident to the exercise of the power to regulate interstate commerce.

The generation of electric power constitutes no part of interstate commerce. *Utah Power & Light Co. v. Pfost,* 286 U. S. 165, 179-182; *South Carolina Power Co. v. South Carolina Tax Commission,* 52 F. (2d) 515, 524, affirmed 286 U. S. 525. Even apart from that consideration, there

is no contention that the power to regulate interstate commerce authorizes the United States to engage in any business merely because it is an interstate business. Thus, Congress has power to reach every subject of taxation, but "Congress cannot authorize a trade or business within a State in order to tax it." *License Tax Cases*, 72 U. S. (5 Wall.) 462, 471. The appellees' contention is—(1) that under the power to regulate interstate commerce the Federal Government has the implied power (a) to construct navigation facilities and to improve the navigable capacity of interstate navigable streams, and (b) to engage in the construction of works for flood control; and (2) that the power here in controversy comes into being as the incidental result of the exercise of one or both of these powers. We examine these contentions in the order stated.

1. The electricity will not be brought into being as the incidental result of an exercise of the implied power of the Federal Government to improve interstate navigable streams for navigation.

While commerce includes navigation (*Gibbons v. Ogden*, 9 Wheat. 1), the power to create interstate navigable waterways and to improve interstate navigable streams for navigation is *implied* from the power to regulate interstate commerce. Navigable waters and the soils under them belong exclusively to the States, subject only to the rights surrendered to the Federal Government under the Constitution. *Martin v. Waddell*, 16 Pet. 367, 410; *Shiveley v. Bowlby*, 152 U. S. 1, 15. The United States has no title or property right in the navigable streams or the lands over which they flow (*Port of Seattle v. Oregon & W. R. R. Co.*, 255 U. S. 56, 63; *United States v. Utah*, 283 U. S. 64; *Kansas v. Colorado*, 206 U. S. 46; *United States v. Cress*, 243 U. S. 316); and every property right of riparian owners on navigable streams is created by and flows exclusively

from State sovereignty. *United States v. Cress, supra; Packer v. Bird,* 137 U. S. 661; *Port of Seattle v. Oregon & W. R. R. Co., supra.* It is settled that the United States in general has no power to engage in the business of generating electricity. *United States v. Chandler-Dunbar Co.,* 229 U. S. 53, 73; *Ashwander v. Tennessee Valley Authority, supra*; *Alabama Power Co. v. Gulf Power Co.,* 283 Fed. 606, 613; *Missouri ex rel. Camden v. Union Electric Light & Power Co.,* 42 F. (2d) 692, 695.

"The right of the United States in the navigable waters within the several States is limited to the control thereof for purposes of navigation." *Port of Seattle v. Oregon & W. R. R. Co.,* 255 U. S. 56, 63. See also *Appleby v. New York,* 271 U. S. 364, 381, 402; *Scott v. Lattig,* 227 U. S. 229, 242-3. Any legislation ostensibly for the control or improvement of navigable waters which has no real or substantial relation to such control or improvement is unconstitutional and void. *United States v. River Rouge Improvement Co.,* 269 U. S. 411, 419; *Wisconsin v. Illinois,* 278 U. S. 367, 415.

In order that electricity may constitutionally "come into being in the exercise" of the power to make navigation improvements, it must be *incidentally* and *necessarily* produced by the works constructed for navigation and those works must be reasonably appropriate for, and have a real and substantial relation to, the improvement of navigation. In *United States v. Chandler-Dunbar Co.,* 229 U. S. 53, this Court said:

> "If the *primary* purpose is legitimate, we can see no sound objection to leasing any excess of power over the needs of the Government." (loc. cit. 73.)

This Court then, in explanation and support of its ruling, quoted with approval from *Kaukauna Water Co. v. Green Bay Co.,* 142 U. S. 254. In the *Kaukauna* case this Court

said, even with reference to a dam built pursuant to the more extensive State authority:

> "* * * if, in the erection of a public dam for a recognized public purpose, there is *necessarily* produced a surplus of water, which may properly be used for manufacturing purposes, there is no sound reason why the State may not retain to itself the power of controlling or disposing of such water as an *incident* of its right to make such improvement." (loc. cit. 273.)

But in that case this Court condemned the creation of "a wholly unnecessary excess of water" and confined its approval to "cases where the *surplus*[1] is a mere incident to the public improvement." (loc. cit. 275.)

It therefore follows that where large and costly additions are made to, or superimposed upon, constitutional structures, which additions serve no useful or consequential purpose of the constitutional objective but are plainly and directly adapted to create, and do create, large quantities of water power that would not otherwise be created, such additions to, or enlargements of, the constitutional structures are plainly in excess of federal power. Even more plainly, separate structures, which do not directly or consequentially serve or promote the improvement of navigation but are related to the constitutional objective only by the circumstances of embodiment in a single statutory or administrative scheme and which directly and plainly are adapted to create, and do create, large quantities of

---

[1] "Surplus power" means the difference between the amount of power incidentally created by the navigation structure and the amount of power used for operation of navigation facilities or other government uses. It does not mean the difference between the amount of power used for operation of navigation facilities or other government uses and the maximum amount of power which could be developed from the stream by a project directed wholly, or in part, specially to the development of the power resources of the stream.

power, are beyond federal constitutional power. The real, substantial and *bona fide* relation to navigation improvement is lacking. *United States v. River Rouge Improvement Co.*, 269 U. S. 411, 419; *Wisconsin v. Illinois*, 278 U. S. 367, 415. *In both cases there is not merely a forbidden exercise of federal power, but a complete absence of federal power.*

This conclusion is reenforced by the settled rule that the interstate commerce power, from which power to improve navigable streams is implied, may not be extended so as to control matters reserved to the States or the people upon the basis of indirect, remote or insubstantial relationships between the things sought to be controlled and interstate commerce. *Schechter Corp. v. United States*, 295 U. S. 495, 546; *National Labor Relations Board v. Jones & Laughlin Steel Corp.*, 301 U. S. 1, 36-37; Dissenting opinion of Cardozo, *J.*, in *Carter v. Carter Coal Co.*, 298 U. S. 238, 327-8. While in the situations stated in the previous paragraph relationship between the structure and improvement of navigation is entirely lacking, this rule makes plain that an indirect, remote or inconsequential relation to the improvement of navigation would not supply constitutional power for the construction of such a structure. Federal power may not be extended on such a slender basis into the concerns of the State with the practical effect of vesting in the Federal Government the ownership of the power resources of the rivers of the States, the right to engage in the intrastate business of generating electric power, the right and power to oust the States' police power over such a local business, the power to deprive the States of tax resources arising out of such local business, the power to deprive the States of their right to determine when and how their natural resources shall be developed subject only to the paramount right of the United States to control the waters of their navigable

streams *for navigation alone*, or the power to destroy the right of the citizens of those States to engage in that business, subject only to State regulation. Otherwise, in a large and important field, this implied power "would absorb or imperil the powers reserved to the States" and the people.

Our inquiry is, therefore, confined to the question whether the creation of the raw water power (which is later manufactured into electricity) will be the *incidental* and *necessary* result of the operation of structures which have a real, substantial and *bona fide* relation to the improvement of the Tennessee River for navigation. *Kaukauna Co. v. Green Bay Co.*, 142 U. S. 254, 273; *United States v. Chandler-Dunbar Co.*, 229 U. S. 53, 73; *Ashwander v. Tennessee Valley Authority, supra.*

To be incidental to a navigation improvement, the raw water power must come into being through the operation of structures having a real, substantial and *bona fide* relation to the achievement of the constitutional purpose or objective. When additional structures are superimposed upon the navigation structures, when the navigation structures are greatly enlarged or when entirely separate structures are built, not for the purpose of carrying out the constitutional objective but to create the raw water power which would not otherwise be developed, then the creation of that power ceases to be incidental to the constitutional objective and becomes, depending upon the relative magnitude of the power development and the constitutional objective, either the primary purpose of the scheme or at least a separate and independent objective. In either case the scheme is outside the field of federal power. Obviously, where the production of power is the primary purpose, the whole scheme falls. Whether the whole scheme falls in the case where the production of power is merely an independent objective must depend upon whether the power

project is so intermingled with the navigation project that it cannot be extricated and leave the scheme effective to achieve the constitutional purpose.[1] *Retirement Board v. Alton Railroad Co.*, 295 U. S. 330, 362; *Carter v. Carter Coal Co.*, 298 U. S. 238, 312; *The Employers' Liability Cases*, 207 U. S. 463, 501.

We now consider the questions, *first*, whether the *power project authorized in the TVA Act* is incidental to navigation improvement; *second*, whether the *power project included in the TVA Unified Plan*, considered as a whole, is incidental to navigation improvement; *third*, whether in any event the *power to be produced by the tributary dams* included in the TVA Unified Plan is incidental to navigation improvement; and *fourth*, whether the statutory and administrative plans do not also plainly attempt to exercise power not granted but forbidden to the Federal Government in the guise of exercising an implied power to improve streams for navigation.

---

[1] The appellees rely upon the rule that a constitutional project or structure is not rendered invalid because it also serves another purpose and perhaps one outside the field of federal power. *Arizona v. California*, 283 U. S. 423. That rule is subject to at least two limitations,—*First*, the rule applies only where there has been no enlargement of the project or structure beyond the scope of the constitutional objective, and no construction of additional structures outside the constitutional objective and related to it only by the circumstance of embodiment in a single scheme. Where, as here, the works or project has been enlarged and supplemented by additional structures beyond the scope of the constitutional objective, *the scheme may not be saved by inverting the principle invoked and asserting that the scheme is valid because, although exceeding constitutional power, it has elements which also serve constitutional objectives. Second*, the rule may not be pressed to the point where it permits Congress to exercise power not delegated but forbidden to it by the Constitution. The decision of this Court in *Arizona v. California* obviously may not be construed as in any way conflicting with these principles; for if that decision were susceptible of such a construction, then it would be to that extent in conflict with settled principles of constitutional law and with a long line of decisions of this Court running up to and including *Ashwander v. Tennessee Valley Authority, supra.*

(a) That power development is an independent, if not the primary, purpose of the TVA Act, is plain on the face of the Act.

In our analysis of the statute (pp. 12-14, *supra*) we have set forth with particularity many of the numerous provisions which, in our view, conclusively establish that on the very face of the Act the development of the power resources of the Tennessee River and its tributaries is not incidental to navigation improvement, but that the development of such power is at least an independent and separate, if not controlling, objective of the statute. TVA may condemn lands for the construction of "dams, reservoirs, transmission lines, power houses and other structures * * * at any point along the Tennessee River or any of its tributaries." (Sec. 4(i).) The Authority has "power to acquire or construct power houses, power structures, transmission lines, navigation projects and incidental works in the Tennessee River and its tributaries, and to unite the various power installations into one or more systems by transmission lines. (Sec. 4 (j).) The tributary projects, as shown by the extensive directions with reference to Norris Dam, are to be constructed "so that the maximum amount of primary power may be developed" at all other dams downstream. (Sec. 17.) TVA may issue bonds on the credit of the United States for the construction of steam electric generating plants or any other facilities for the generation or transmission of power. (Sec. 15.) The President is required from time to time to recommend such further legislation to Congress, if any, as he deems proper "to carry out the general purposes" stated in the Act, and "for the *especial purpose* of bringing about in said Tennessee drainage basin and adjoining territory in conformity with said *general purposes*" among other things, the "*maximum generation of electric power* consistent with flood control and navigation." (Sec. 23.) When power development

is merely incidental to navigation improvement, no statutory admonition about its development is necessary—it follows as the shadow follows the substance; and when the statute admonishes the agency created not only to develop the power resources of the river system, but to develop them in such a way as to develop the maximum power resources of that system, the statute has passed far beyond the field of federal power.

The appellees take nothing by asserting that the statute contains declarations that the power shall be developed in recognition of the paramount rights of navigation. If any private corporation undertook the maximum development of the power resources of the Tennessee basin, it would, as a matter of course, have to develop them in recognition of the paramount rights of navigation. But it would not follow, nor does it follow in the case of TVA under the statute, that the private company would be, or that TVA is, engaged in making a navigation improvement with an incidental power development. The point, misstated by the appellees and misconceived by the court below,[1] is not whether the statute went so far as to say that TVA should develop the maximum power resources of the Tennessee basin *in disregard of* the rights of navigation on the Tennessee River *but whether the statute did direct the TVA to develop the power resources on the Tennessee River and its tributaries.* The statute says upon its face that what-

---

[1] The trial court stated the issue on this point to be whether the generation of power was "inconsistent" with navigation. (Opinion R. 545.) If inconsistency, that is, conflict, were the test rather than whether the creation of energy is the "incidental" result of the operation of *bona fide* structures for the improvement of navigation, there would be no limit to the power of the Federal Government to engage in the manufacture of electricity so long as the federal power project did not actually obstruct navigation. In other words, the Federal Government would have the same power to engage in the manufacture of electricity as any private power company.

ever Congress intended to do with respect to navigation, and whatever Congress intended to do with respect to flood control, *it also definitely intended deliberately, separately, and purposefully to develop the power resources of the Tennessee River and its tributaries.*[1]

The legislative history confirms the face of the Act in this respect. The project adopted by Congress in the Rivers and Harbors Act of July 3, 1930, for the improvement of the Tennessee River for navigation from its mouth to Knoxville, provided for a 9-foot channel with 3 feet overdepths at critical points and locks 110 x 600 feet throughout. The channel and lock dimensions provided by this Act conformed to the channel and lock dimensions in the navigation improvements completed and in process of execution on the upper Mississippi, the Ohio, the Missouri, the Illinois, the Kanawha and, in general, the principal rivers of the great Mississippi inland waterway system. (See p. 26, *supra.*) When Congress adopted the TVA Act on May 18, 1933, to provide for the development of the power resources of the Tennessee basin, Congress did not by that

---

[1] The trial court apparently thought that even though the statute requires the maximum development of the power resources of the Tennessee River and its tributaries, the statutory declaration (added in the Amendments of 1935) that the power project should be operated in subordination to the paramount rights of navigation (just as in the case of any private power project on a navigable stream), made the creation of the power incidental by legislative fiat. (Opinion R. 560.) Not only was this a complete misconstruction of the statutory language, as shown above, but it was an erroneous conception or application of the law on statutory declarations and findings. Both legislative declarations of purpose and legislative findings of fact must fall before the truth. It is plain that this must be so. Where, as in so many cases involving constitutional rights, finality of fact is finality of law, it is obvious that any principle which permitted legislative recitals or findings to be given controlling weight other than in cases where the fact remained in doubt upon the evidence in the record would eventually destroy the constitutional function of the courts. *Crowell v.*

(Continued on page 105)

Act adopt any navigation project for the improvement of the Tennessee.

Indeed, prior to the amendments of 1935 (which were adopted at the instance of TVA and, we think it is fair to say, in an attempt to provide protective coloring for its power development in the light of its experience in the *Ashwander* case), the TVA Act did not even require TVA incidentally to create a navigation channel of any particular depth, width or size of locks wherever it substituted a large power pool for one or more navigation pools contemplated by the Federal Navigation Project. TVA could have provided an incidental navigation channel with controlling depths of 3 feet, 6 feet, or 9 feet, with any minimum width and with locks only large enough for pleasure launches; and no one could have said that TVA had thereby violated the statute. And even the amendment of 1935 only brought into the statute *a single requirement* with reference to the navigation channel incidentally to be provided in connection with the development of the

---

Benson, 285 U. S. 22; *Minnesota v. Barber*, 136 U. S. 313, 319; *Mountain Timber Co. v. Washington*, 243 U. S. 219, 237; *Near v. Minnesota ex rel. Olson*, 283 U. S. 697, 708. The determination of constitutional rights of citizens would be transferred to the legislative branch. Individuals and minorities would be powerless to defend their constitutional rights against legislative usurpation. This principle is especially important under the modern legislative practice of incorporating by legislative fiat purported findings of ultimate facts. In *Mugler v. Kansas*, 123 U. S. 623, 661, this Court said:

> "• • • *The courts are not bound by mere forms, nor are they to be misled by mere pretenses. They are at liberty—indeed, are under a solemn duty—to look at the substance of things, whenever they enter upon the inquiry whether the legislature has transcended the limits of its authority.* If, therefore, a statute purporting to have been enacted to protect the public health, the public morals, or the public safety, has no real or substantial relation to those objects, or is a palpable invasion of rights secured by the fundamental law, it is the duty of the courts to so adjudge, and thereby give effect to the Constitution."

power resources of the Tennessee River and its tributaries —that was a requirement that the incidental channel should be 9 feet (Sec. 4(j))—but there was no requirement with reference to widths, size and number of locks, or any other essentials of a navigable channel. This should be compared with the standard practice on federal navigation projects whereby these matters are specified in detail in the official War Department Report which is incorporated in the Rivers and Harbors Act by reference as a definition of the project adopted. On the other hand, the TVA Act did not entrust the operation of the incidental navigation facilities to TVA, but left their operation with the Corps of Engineers just as in the case of any private power development. (Secs. 7(a), 5(k).)

(b) Considering the TVA Unified Plan as a whole, it is plain that it is a power project and that the water power created is in no sense the incidental result of a navigation improvement on the Tennessee River.

In general either the Federal Navigation Project or the incidental navigation facilities to be provided in connection with the TVA power project will result in a 9-foot channel from the mouth of the Tennessee River to its head at Knoxville. However, a review of the facts shows that the structures embodied in the TVA Unified Plan are *entirely different in physical characteristics and purpose* from those in the Federal Navigation Project; that, apart from certain incidental and relatively minor navigation facilities *without which the TVA Unified Plan would completely bar through navigation,* the TVA structures are *plainly, directly and solely adapted to the creation of a vast amount of power* and are unnecessary and useless, if not actually detrimental, from the standpoint of navigation; that the incidental navigation facilities have been included in the TVA Unified Plan merely to replace the navigation channel of the Fed-

eral Navigation Project which is flooded out and destroyed by the TVA power project;[1] that the only relation between the TVA power structures on the main stream and the incidental navigation facilities provided on that stream is that the latter are necessary to preserve navigation which would otherwise be barred by the TVA power structures; that, stated most favorably to the appellees, *the TVA main stream structures* are power structures with some incidental navigation facilities and not navigation structures which incidentally create water power; and that the TVA tributary projects are related to navigation only by the circumstance of embodiment in a single statutory and administrative scheme and consequently are devoid of any relation to navigation improvement. (See pp. 22-36, *supra.*)

In short, these TVA structures have no real or substantial relation to the improvement of navigation. *Wisconsin v. Illinois,* 278 U. S. 367, 415, 418; *United States v. River Rouge Improvement Co.,* 269 U. S. 411, 419. Plainly therefore, these TVA structures are wholly outside the field of federal power. There is not merely an illegal exercise of federal power but a complete absence of that power.

To hold otherwise would be to overturn the established principle that the Federal Government may not create or acquire water power except as it comes into being in the operation of structures reasonably adapted, and having a real and substantial relation, to the improvement of navigation[2] and lay down the antagonistic principle that the

---

[1] This is the precise requirement which the Rivers & Harbors Act of July 3, 1930, adopting the Federal Navigation Project for the Tennessee River, *imposed upon private interests, States or municipalities which might desire to undertake the construction of any of the power projects which are now being built by TVA.*

[2] This discussion deals specifically with the power to improve navigable streams. The same principle, of course, applies to constitutional structures built in the exercise of any other federal power. This discussion also deals with the creation of water power and not its conversion into electricity.

Federal Government may build any structures it chooses for the creation of water power so long as the power scheme includes some incidental facilities either to improve, or overcome obstructions created by the power project to, navigation. The right of the Federal Government to develop water power would thus be made coextensive with, but dominant over, the power of a State or a private power company to develop water power. This seems to have been the view of the trial court. (See footnote, p. 103, *supra.*)

The Federal Navigation Project would produce no commercial power. The TVA Unified Plan is designed to create and will create the largest hydro-electric system in the United States, if not in the world, with a capacity nearly as large as the total quantity of electricity generated by utilities in 1936 in the seven States any part of which lies within the Tennessee drainage basin. (See pp. 65-69, *supra.*)

There is no rational explanation of the fact that the TVA Unified Plan will cost approximately $473,000,000, (which is six and three-tenths times as much as, or approximately $400,000,000 in excess of, the cost of the Federal Navigation Project), except that the TVA Unified Plan is a vast power project while the Federal Navigation Project is a navigation improvement. This additional sum is so "grossly disproportionate" to the cost of the Federal Navigation Project and to any justifiable expenditure for the benefit of navigation (see pp. 28-29, *supra*), that the conclusion must be that the purpose is to promote some other result (*United States v. Constantine*, 296 U. S. 287, 289); and since this vast additional expenditure is for structures which are plainly adapted to, and do, produce a vast quantity of water power which would not otherwise be created, it is equally plain that that other result is power development.

This circumstance can not be explained on the ground that the TVA Unified Plan provides any superior naviga-

tion facilities. (See testimony of General Pillsbury before Congressional Committee, pp. 35-36, *supra.*) In the substantial and important characteristics of an inland waterway, such as capacity for carrying commerce, controlling depths, integration with the great Mississippi inland waterway system, cost or economic justification, prompt provision of a continuous 9-foot channel, duration of open river navigation, and adaptedness of structures to navigation and safety, the Federal Navigation Project is superior to the channel which will be incidentally provided in connection with the power project known as the TVA Unified Plan. (See pp. 22-31, *supra.*)

Other variations between the channel of the Federal Navigation Project and the incidental TVA channel are only in minor details which will offset each other so that (disregarding the superiority of the Federal Navigation Project in the foregoing consequential characteristics) there is no practical difference between them from the standpoint of practical navigation. (Putnam R. 1160, 1168; Kelly R. 1374; see Pillsbury pp. 35-36, *supra.*) Some of appellees' claims with respect to advantages of the TVA incidental channel in these minor details are without basis in fact. Others are offset by corresponding or more serious disadvantages. All are merely incidental results of maximum power development and not the result of any provision made for the benefit of navigation. As disclosed by the review of the facts, the balance is in favor of the Federal Navigation Project even in relation to these minor details, but in any event, such differences between the two channels are without significance from the standpoint of practical navigation even if they were not far outweighed by the superiority of the Federal Navigation Project channel in the consequential characteristics of an inland waterway. (See pp. 31-36, *supra.*)

We deal here with the question whether there exists a factual basis for the exercise of federal power and hence in the matter of finding the facts we are drawing the line between the federal power and the powers reserved to the States and the people and the rights retained by the people. When the determination of facts involves a delineation of the rights of the States and of the United States under our dual system of government, the findings of fact must be based upon substantial rather than fanciful, negligible or inconsequential things; and the power of the Federal Government is not to be extended and the reserved rights of the States and the people curtailed on the basis of negligible or inconsequential things. *Leovy v. United States*, 177 U. S. 621, 623; *United States v. Doughton*, 62 F. (2d) 936, 938.

Just as the interstate commerce power may not in other aspects be extended so as to control matters reserved to the States upon the basis of indirect, remote or inconsequential relationships between the things sought to be controlled and interstate commerce (*Schechter Corp. v. United States*, 295 U. S. 495; Dissenting opinion of Cardozo, *J.* in *Carter v. Carter Coal Co.*, 298 U. S. 238, at 327-8; *National Labor Relations Board v. Jones & Laughlin Steel Corp.*, 301 U. S. 1; *Steward Machine Co. v. Davis*, 301 U. S. 548), even more certainly the implied power to improve interstate navigable streams may not be extended on the basis of facts of inconsequential and negligible character,[1] strained inferences or attenuated relations of fact in order that the Federal Government may acquire water power. Otherwise, federal power may be indefinitely extended by a chain of progressive inferences which have lost all relation to the principal fact from which, as a center, the prog-

[1] Thus it would seem plain that Congress could not forbid farmers to cut their wood lots, tile a boggy meadow or cultivate their fields on the theory that such actions might in some degree affect the flow of navigable streams.

ress started with consequent destruction of all constitutional limitations.

Manifestly, when all of the claims of the appellees are put together, the alleged relationship between the creation of the water power and the improvement of navigation are non-existent or too attenuated and insubstantial to form a basis for the extension of federal power into a field of State sovereignty. The details upon which appellees rely are in fact not even remote incidents of a navigation improvement but merely remote incidents of a power project. There is, we submit, a complete absence of federal power to construct the power project known as the TVA Unified Plan.

(c) In any event the water power created by the tributary reservoirs in the TVA Unified Plan is not incidental to the improvement of navigation.

More than five-sixths of the water power to be created by the TVA Unified Plan is to be created by use of the tributary reservoirs. This includes the power created at the sites of the tributary reservoirs and the increase in firm power which the tributary reservoirs create at downstream plants. These tributary reservoirs are Norris, Hiwassee and Fontana. These tributary dams range in height from 265 to 450 feet. None of them has, or will have, any navigation facilities and there is no navigation on the tributaries where they have been or are to be constructed. With the completion of either the Federal Navigation Project or the navigation facilities which will be incidentally constructed in connection with the power project known as the TVA Unified Plan, these tributary reservoirs will contribute nothing to navigation on the Tennessee as *the low water flow of that river is more than sufficient to supply all requirements of navigation without the aid of low water releases; and the effect of such tributary reservoirs on navigation, if any, will*

be unfavorable. (See pp. 24-26, *supra.*) There can be no respectable pretense that these tributary projects have any real, substantial or bona fide relation to the improvement of navigation.
